a UNITED STATES OF AMERICA:

In the District Court of the United States for the Eastern District of Michigan, Southern Division. In Equity.

DULUTH, SOUTH SHORE & ATLANTIC RAILWAY COMPANY, Plaintiff,

vs.

ALEX. J. GROESBECK, CASSIUS L. GLASGOW, CHARLES S. CUNNINGHAM, Addison A. Keiser, Morgan W. Joplin, John R. Van Evera, and Fred S. Case, Defendants.

Clerk's Return to Claim of Appeal in Above-entitled Cause from said Court to the United States Supreme Court.

1 1.

United States Circuit Court, Eastern District of Michigan, Southern Division. In Equity.

DULUTH, SOUTH SHORE & ATLANTIC RAILWAY COMPANY, Complainant,

v.

FRANZ C. KUHN, CASSIUS L. GLASGOW, GEORGE W. DICKINSON, Lawton T. Hemans, John R. Van Evera, Morgan W. Jopling, and Fred S. Case, Defendants.

Bill of Complaint.

To the Judges of the Circuit Court of the United States for the Eastern District of Michigan:

Your orator, the Duluth, South Shore & Atlantic Railway Company brings this its bill of complaint against Franz C. Kuhn, a citizen of the State of Michigan and a resident of the County of Macomb, Cassius L. Glasgow, a citizen of the State of Michigan and a resident of the County of Barry, George W. Dickinson, a citizen of the State of Michigan and a resident of the County of Oakland, Lawton T. Hemans, a citizen of the State of Michigan and a resident of the County of Ingham, also, John R. Van Evera, Morgan W. Jopling and Fred S. Case, all citizens of Michigan residing in Marquette County and who are hereby made defendants, and thereupon your orator avers:

I.

Your orator is a consolidated railroad corporation duly created under the laws of the States of Michigan and Wisconsin, has its principal office at the City of Marquette in the State of Michigan, and is a common carrier of freight and passengers, and as
2 such is engaged in state and inter-state commerce, and owns, maintains and operates lines of railroad in the States of Michigan and Wisconsin, and in order to reach Duluth, operates its trains over a line of railroad of another company within the State of Minnesota. Its system of railroads, including its main line or lines and its branches, comprise about 584 miles of road owned by it, and 20.83 miles of road over which it operates its trains under agreement with other companies. About 475 miles thereof is situate within the State of Michigan. Its line extends from Sault Ste. Marie, Michigan, to Duluth, Minnesota, with a branch from Soo Junction in Luce County, Michigan, to St. Ignace, Michigan, and a branch from Nestoria, in Baraga County, to Houghton in Houghton County, Michigan, and other short branches in Michigan. It crosses the counties of Chippewa, Mackinac, Luce, Schoolcraft, Alger, Marquette, Baraga, Houghton, Ontonagon and Gogebic, in Michigan, thence westerly, from the westerly boundary of Gogebic County across the northerly portion of Wisconsin to the City of Superior, from which last named place it operates its trains as aforesaid over the line of another company to Duluth, Minnesota. The whole of its said railroad constitutes one system, and long has been, and now is, operated as such.

It has outstanding common stock of a par value of $12,000,000 and preferred stock of the par value of $10,000,000. Its outstanding bonds amount to $18,923,000 covering its entire system, and $1,077,000 covering its main line from Marquette, Michigan, to Houghton, Michigan, and its branch from Humboldt, Michigan, to Republic, Michigan, with the side tracks and other property appurtenant to such main line and branch line, being only about 104 miles of its road in Michigan. Its cars, engines, supplies and appliances are, for the most part used upon the system wherever required without regard to state lines. It is impossible to operate separately, with due regard to economy or the interests of the public, that portion of the system of your orator situate in any particular state. To a
3 great extent, the trains of your orator, whether freight or passenger, necessarily move between different states, and even when their movements are confined to one state, the same trains and the same cars carry both inter-state freight or passengers and intra-state freight or passengers. The principal business of your orator consists of interstate commerce, either wholly upon its own line, or jointly with other common carriers, and it is a carrier in such commerce subject to the exclusive jurisdiction, supervision and control of the Congress of the United States.

II.

The defendant, Franz C. Kuhn, is the Attorney General of the State of Michigan, duly elected, qualified and acting as such. The defendants Cassius L. Glasgow, George W. Dickinson and Lawton T. Hemans, are Commissioners constituting the Michigan Railroad Commission, duly appointed, qualified and acting as such under the general Statutes of said state creating such Commission. The above named defendants, John R. Van Evera, Morgan W. Jopling and Fred S. Case, and each of them are persons accustomed to use, and intending in the future to use, as passengers thereon, your orator's railroad between stations on said railroad within the State of Michigan. They represent a class of passengers within said state, most of whom are necessarily unknown to your orator, so numerous that it is impossible to join them all as parties hereto, and they are made defendants hereto for the purpose of determining the right of all passengers under Act 276 hereinafter referred to.

III.

Your orator represents that the Legislature of the state of Michigan, at its session in 1911, enacted Public Act No. 276, entitled "An Act to amend Sec. 9 of Act No. 198 of the laws of 1873, entitled 'An Act to revise the laws providing for the incorporation of railroad, bridge and tunnel companies, and to regulate the running and management, and to fix the duties and liabilities, of all railroad, bridge, tunnel and other corporations owning or operating any railroad, bridge or tunnel within this state,'" the section
4 amended being compiler's Sec. 6,234 of the Compiled Laws of the State of Michigan of the year 1897; and by the said Act 276, the said Legislature, among other things, enacted and provided that the tolls and compensation to be charged for transporting any passenger and his or her ordinary baggage, not exceeding in weight 150 pounds, should not exceed, for a distance of five miles, three cents per mile; and for all other distances for all companies the gross earnings of whose passenger trains, as reported to the Commissioner of Railroads for the year 1906, equalled or exceeded the sum of $1,200 per mile for each mile of road operated by any such railroad company on which regular passenger service is maintained, as thereinafter provided, two cents per mile; and for all companies whose earnings, reported as aforesaid, were less than $1,200 per mile of road operated by such company, three cents per mile. For children under twelve years of age a charge of one-half the above fares is provided. That the gross earnings of your orator's passenger trains, as reported to the Commissioner of Railroads of the State of Michigan for the year 1906, and for each subsequent year reported, exceeded the sum of $1,200 per mile for each mile of road operated by it within the State of Michigan on which regular passenger service was maintained. Such law, if valid, as to your orator and enforced against it, will make it unlawful for your orator to charge for the transportation of passengers within the State of Michigan more than

two cents per mile, whereas now it is, and hitherto has been, allowed to charge three cents per mile, and prior to September, 1907, it was allowed to charge four cents per mile.

IV.

This is a suit in equity arising under the Constitution of the United States, for that your orator seeks to enjoin the defendants above named, and each of them, from attempting in any manner to enforce against your orator the provisions of said Act 276
5 prescribing the rates, fares and charges for the transportation of passengers as aforesaid, or from instituting any action or proceeding against your orator, its officers, directors, agents or employes, for the violation of such provisions, for the reason that said Act, in so far as it attempts to prescribe as against your orator and compel it to accept the rates, fares and charges in said Act prescribed, is violative of the provisions of the fourteenth amendment to the Constitution of the United States, in that it will operate to deprive your orator of its property without due process of law, and to deny to your orator the equal protection of the laws. The matter in dispute in this suit exceeds, exclusive of interest and costs, the sum of $2,000.

V.

Said defendant Franz C. Kuhn, as Attorney General of the State of Michigan, threatens and intends to, and will, unless restrained by this court, take and institute proceedings against your orator, its officers, agents, servants and employees, to compel your orator and them to put into effect the rates, fares and charges prescribed in said Act 276, and to maintain and keep the same in effect. Said defendants Cassius L. Glasgow, George W. Dickinson and Lawton T. Hemans, as the Railroad Commission aforesaid, threaten to and will, in case your orator shall fail or refuse to put in effect, and to keep and maintain in effect, such rates, fares and charges, give to your orator the notification provided for in said Act 276; and in case your orator shall, within thirty days after such notification, fail or refuse to put in effect and maintain the rates, fares and charges, institute and cause to be instituted against your orator numerous actions, suits and proceedings for the purpose of enforcing against your orator the penalty of $500 per day for each and every secular day during the pendency of such failure as provided in said Act 276. They threaten to and will call upon the Attorney
6 General, or the Prosecuting Attorney of each county in Michigan through which your orator's road passes, to institute and prosecute actions, suits and proceedings to compel your orator to carry out and obey the provisions of said Act 276 with reference to rates, fares and charges, and to punish your orator by the enforcement of the penalties aforesaid.

Said defendants, John R. Van Evera, Morgan W. Jopling and Fred S. Case, are members of a class, as hereinbefore stated, each

of whom will be entitled, under the provisions of Sec. 6,235 of the Compiled Laws of the State of Michigan of 1897, to commence an action, on the refusal of your orator to carry him for the rates, fares and charges named in said Act 276, to recover the actual damage sustained by him by such refusal, or, at his election, a penalty of $100, and your orator believes and alleges that it will be harassed by, and subjected to, a multitude of such actions commenced to recover such penalties.

For the determination of the validity of said rates, fares and charges as applicable to your orator and its railroad, an examination of an immense number of complicated facts is necessarily involved. It is necessary to determine the value of your orator's entire property; its value in Michigan; the proportionate value of your orator's property used and to be used for the transportation of passengers, inter-state and intra-state, in Michigan; the total amount of the earnings of your orator allowable to its lines in Michigan; the amount of such earnings allowable to the freight business and to the passenger business in Michigan; the amount of earnings derived from transportation of passengers inter-state and intra-state in Michigan; and the apportionment of various miscellaneous items of earnings to the inter-state and intra-state passenger business in Michigan; the total amount of expenses for the operation of your orator's line;
7 the division of such operating expenses between the states in which your orator's lines are located; the division of such operating expenses between the freight and passenger business of your orator; the division of the passenger operating expenses in Michigan between the interstate passenger business and the intra-state passenger business; the apportionment of taxes paid in Michigan between the passenger business and the freight business of your orator in Michigan; the apportionment of the amount of taxes charged against the passenger business of your orator in Michigan between its intra-state and its interstate passenger business; together with other facts too numerous here to be stated, and the determination of which is most intricate and difficult, but all of which are necessary to be determined before it can be decided whether your orator will receive any or an adequate compensation from all its business, or from its intra-state passenger business in Michigan.

The accounting department of your orator's railroad has been, since the passage of Act 276, and is now, engaged in examining its accounts and determining the questions above suggested, and your orator is advised and believes, and so alleges the fact to be, that the profit from its business in Michigan will be so slight, if any, if it is compelled to accept a two cent per mile fare for the transportation of passengers, that it will amount to a confiscation of its property, and it brings this suit in good faith for a speedy and final judicial determination of the validity of the rates, fares and charges aforesaid as applicable to your orator and its railroad.

That the average number of passengers carried by your orator each day on its lines between stations in Michigan is about 1900, and there is no reason for believing that it will be less in the future, and if

your orator should be subjected to a penalty of $100, for each passenger whom it shall refuse to carry for two cents per mile, its liability will be about $190,000 per day, to say nothing of the $500 per day penalty hereinbefore referred to; and if such penalties shall
8 be enforced, the necessary result must be to deprive your orator of the right to have a judicial determination of the validity of the rates, fares and charges aforesaid, and it would thereby be deprived of its property without due process of law, and would be denied the equal protection of the laws, all in violation of the said fourteenth amendment of the constitution of the United States.

VI.

For many years immediately last past, the general basis of fares and charges for the transportation of passengers upon the lines of your orator in Michigan, whether for traffic local to Michigan or inter-state between Michigan and another state, or between points in Michigan and points in the Dominion of Canada, has been and now is three cents a mile (except for children entitled to half fare), which fares and charges have never been excessive or unreasonably high, but on the contrary, are, and always have been, so low as not to yield, over and above the cost of doing the business, any just or reasonable return to your orator on the fair, proportionate value of its property used in the conduct of its passenger business and properly assignable thereto.

The fares for all passengers traveling on your orator's line from points within the State of Michigan to points beyond its limits, whether reached by your orator's line or by the line of a connecting carrier, for a long time last past have been and now are generally arrived at and made by taking the sum of the local fares and charges, that is, by adding three cents per mile for each mile travelled in Michigan, (except children entitled to half fare) to the amount of the local fares for the other parts of the route. For example: Newberry, Michigan and Superior, Wis., are points on the main line of your orator's road 353.6 miles apart. The fare which is now and for a long time last past has been charged by your orator between said points is $9.50, arrived at as follows: 244.4 miles of such distance is within the State of Michigan, and
9 at three cents per mile amounts to $7.33; 109.2 miles of such distance is within the State of Wisconsin, which, at two cents per mile (the local rate in Wisconsin), amounts to $2.18.

The station of Montreal, in Gogebic County, Michigan, on your orator's line is near the Western boundary of Michigan, and 242 miles westerly from Newberry. If the fare prescribed by Act 276 shall be enforced, the fare from Newberry, Michigan, to Montreal, Michigan, can not exceed the sum of $4.84, which, added to the fare from Montreal to Superior, $2.18, amounts to $7.02, being $2.48 less than the present fare from Newberry, Michigan to Superior, Wis.

Again, Marquette, Michigan, and Lake Nebagamon, Wis., are

points on the main line of your orator's road. The present fare is $6.00, being three cents per mile for 147.9 miles in Michigan, and two cents per mile for 79.4 miles in Wisconsin. If said Act be enforced against your orator, the fare from Marquette, Michigan, to Montreal, Michigan, a distance of 145.5 miles, cannot exceed $2.91 and the fare from Montreal, Michigan, to Lake Nebagamon, Wis., at two cents a mile, would amount to $1.63, aggregating $4.54,—being $1.46 less than the present fare.

Still further: The present fare from the City of New York to Marquette, Michigan, via Mackinaw, is $25.33, made up as follows: The fare from New York to St. Ignace, Michigan, a terminus on your orator's line, is $20.80. The distance on your orator's line from St. Ignace to Marquette is 151 miles, which, at three cents a mile, amounts to $4.53. If the rates, fares and charges in said Act 276 be enforced against your orator, the fare from St. Ignace to Marquette can not exceed $3.02, which, added to $20.80, amounts to $23.82, a reduction of your orator's inter-state fare of $1.51.

The rates, fares and charges for the passenger business of your orator, made up of travel between points on your orator's line within the State of Michigan, and points beyond the limits of the State of Michigan, are made, filed and published in accordance with the requirement of the Act to regulate commerce and the amendments thereto, and are the only rates, fares and charges which may legally be applied to such passenger business. The direct and immediate effect of the installation of the rates, fares and charges prescribed in said Act 276 will be to deprive your orator of a substantial part of its inter-state passenger business between points on its line in the State of Michigan, and points beyond the limits of the State of Michigan, because the fares and charges for transportation of a passenger, a part of whose route is partly within and partly beyond the limits of Michigan, will then necessarily exceed the sum of the fares and charges for which such passenger may travel on local tickets. And while your orator is unable to learn definitely how much of its said inter-state passenger business will be so destroyed by the application of such rates, fares and charges on account of the purchase of local tickets on your orator's line between points in Michigan, being a part of inter-state travel, its officers believe, and so it avers the fact to be, that the amount thereof will be the greater part of its interstate passenger business.

The immediate, direct and necessary effect of the installation of the rates, fares and charges prescribed in said Act 276 will be to create unfair and unjust discrimination in favor of the passenger business of your orator local to the State of Michigan and against all its passenger business between Michigan and another state, or between Michigan and Canada, or which is made up of travel and routes partly within and partly beyond the limits of Michigan, and also unfair and unjust discrimination in favor of localities on your orator's line within the State of Michigan, and against localities beyond the boundaries of the State of Michigan.

The unavoidable effect of the reduction of the intrastate passenger

rates, fares and charges in said Act 276 prescribed to the business of your orator in Michigan, will be substantially to burden, and directly to regulate and to discriminate against, the inter-state passenger commerce of your orator, and to create undue and unjust dis-
11 crimination between localities in Michigan and those in other states, in violation of the commerce clause of the Constitution of the United States, and in violation of the Act of Congress to Regulate Commerce among the States and with Foreign Nations, and the amendments thereto, commonly known as the "Interstate Commerce Act."

VII.

The roads of your orator are well and *judicially* located, were built in obedience to public necessity, and are now, and always have been, well and economically operated. They are not equipped or constructed with reference to any other business than that which your orator is now doing, and that which it may reasonably expect to have within the near future.

Its property used in the conduct of its transportation business, is all located in the States of Michigan and Wisconsin. Its property used in the transportation business in the State of Wisconsin is reasonably of the value of not less than $2,430,000, and could not be reproduced for that sum.

Its property devoted to its transportation business within the State of Michigan is now, and for several years last past has been, actually, fairly and reasonably of the value of not less than $11,000,000 and could not be reproduced for that sum.

The proportionate value of its said property within the State of Michigan, which now and for some years past has been fairly and justly chargeable and assignable to the total freight business of your orator therein, does not exceed $7,400,000.

The proportionate value of said property within the State of Michigan which now and for some years past has been fairly and justly chargeable and assignable to the total passenger business of your orator in Michigan, is at least $3,600,000.

The proportionate value of its said property within the State of Michigan which now and for some years last past has been fairly and justly chargeable and assignable to the intrastate passenger business of your orator within Michigan, which is covered by the rates, fares and charges in said Act 276 prescribed, is at least $2,048,000.

The fiscal year ending June 30, 1910, may justly be taken
12 to be a fairly representative year, and a guide by which to determine what the net income of your orator from its various classes of business, as well as upon its entire railroad as from its business within Michigan, has been in recent years, and what the same will be in the future.

In said fiscal year the total operating revenue of your orator, both freight and passenger, including all miscellaneous earnings of every kind, did not exceed the sum of $3,302,147.03.

In said fiscal year the total operating revenue of your orator within the State of Michigan, both freight and passenger business,

including all miscellaneous earnings of every kind properly allowable to said state, did not exceed the sum of $2,896,602.50, of which not to exceed $1,940,388.04 was derived from, and assignable to, the freight department of the business in Michigan, and not to exceed $956,214.46 was derived from and assignable to, the passenger department of the business in Michigan, and not to exceed $539,502.50 was Michigan intra-state passenger earnings, including a just proportion of all miscellaneous earnings.

The total operating expenses and taxes in said year were not less than $2,491,778.16.

The total operating expenses and taxes properly chargeable to all of the business within the State of Michigan in said year, was not less than the sum of $2,120,950.09, of which operating expenses and taxes there was properly chargeable to the freight department of the business within Michigan not more than $1,419,536.38, and to the passenger department of the business in Michigan not less than $701,-413.71.

Of the total amount of the operating expenses and taxes properly chargeable to the passenger department of the business within Michigan in said year, there were properly chargeable to the intra-state passenger business in Michigan not less than $426,956.42.

The total net income, over and above operating expenses and taxes, derived from the total business of your orator of all kinds in
13 said year, including outside operations, rentals and hire of equipment, did not exceed the sum of $794,395.23.

The total net income over and above operating expenses and taxes derived from the total business of all kinds, including outside operations, rentals and hire of equipment, in Michigan in said year, did not exceed the sum of $770,694.92, and that derived from, and assignable to, the business of the passenger department in Michigan in said year did not exceed the sum of $256,920.10, and the total net income derived from the intra-state passenger business in Michigan in said year,—including a fair and just proportion of miscellaneous earnings, outside operations, rentals and hire of equipment,—did not exceed the sum of $113,740.14.

For many years prior to, and until 1907, your orator was by law allowed to charge four cents per mile for passenger travel in Michigan (except for children under twelve years of age). By a statute passed in 1907, taking effect in September of that year, this rate was reduced to three cents per mile.

Your orator has always transported children under the age of twelve years and clergymen on its line at one-half the regular fare, and has frequently granted excursion and party rates upon which large numbers of passengers have traveled at less than the regular fare, and competitive conditions have long existed, and will continue to exist, rendering it impossible for your orator to secure its maximum regular fares on certain of its business.

The number of passenger miles on your orator's whole line, and the average amount of revenue per passenger mile in each year ending June 30th, for the last four years, is as follows:

1907	40,284,349	$0.02662
1908	39,627,046	.02446
1909	37,924,125	.02413
1910	40,128,377	.02463

The number of passenger miles on your orator's line in Michigan, and the average amount of revenue per passenger mile in each year ending June 30th, for the last four years, is as follows:

14

1907	33,256,965	$0.02785
1908	32,438,206	.02590
1909	31,145,196	.02541
1910	32,813,258	.025432

In 1910 the total number of passenger miles in the intra-state passenger business of your orator in Michigan was 18,358,957, and the average revenue per passenger mile was .02563 cents, and the total number of inter-state passenger miles in Michigan was 14,454,-301, and the average revenue per passenger mile was .02518 cents.

There is no reason to believe that the passenger traffic on your orator's whole line, or its lines in Michigan, will increase substantially in the near future, for the reason that the territory served by such railroads in the northerly parts of Michigan and Wisconsin is sparsely settled, the population being in the Upper Peninsula of Michigan only about sixteen persons per square mile as against more than forty-two persons per square mile in the Lower Peninsula of Michigan, as your orator is informed and believes. If the rates, fares and charges prescribed in Act 276 be enforced against your orator, it will be impossible, because of the facts hereinbefore alleged, to secure an average of two cents per passenger mile upon its traffic in Michigan, and your orator believes that it will be impossible to secure more than one and eight-tenths cents per passenger mile. At the average revenue of one and eight-tenths cents per passenger per mile on the volume of traffic of 1910, the diminution of its revenue would amount to $243,868.13 per year in Michigan. Assuming that it would be possible to secure two cents per passenger per mile on the average, the diminution of revenue, on the volume of traffic in Michigan in 1910, would be, on interstate passenger business, $103,360.93, and on the inter-state passenger business, $74,873.28; making a total of $178,234.21. If the earnings of your orator's entire line for the year 1910 were reduced by the amount last above mentioned, the return on the entire value of your
15 orator's operating property would not exceed 4.59%, and if its total earnings in Michigan were reduced by the like sum, the return on the value of your orator's entire property in Michigan would be only 5.39%, and if the intrastate passenger earnings in Michigan be reduced $103,360.93, then the rate of return upon the proportionate value of your orator's property used in the conduct of such business and properly assignable thereto, would be less than .506%.

The cost of operation of your orator's lines has not declined within recent years, but, on the contrary, has advanced because of increase in the wages of all classes of laborers and other employes, and the advance in the price of many classes of material required for the operation of the road. The operating expenses per passenger per mile of all passenger business in Michigan, or of the Michigan intra-state passenger business, will not decline but will advance, as the officers of your orator believe and so it alleges the fact to be.

The condition of the property of your orator used in its transportation business for a long time has been—and will continue to be—such as to require large annual expenditures to make up depreciation of property, not formerly included in operating expenses or otherwise provided for, and also for betterments and additions required to enable your orator to discharge its duties to the public. Large sums of money have, in recent years, been taken from the operating income of your orator to make up for depreciation prior to 1907, and for additions and betterments.

Your orator has never paid any dividends upon any of its outstanding capital stock, and has only paid a comparatively small part of the interest accruing upon its bonds outstanding. The annual interest on such outstanding bonds is $859,700., amounting in the last five years to $4,298,500., but the annual payments on account thereof during such period of five years has been $255,420., except that in the year 1909 it paid $395,420., making the aggregate of all payments for the five years of $1,417,100.

16 The reduction of the rates, fares and charges prescribed by Act 276—even if the same be confined solely to the intra-state passenger business of your orator in Michigan,—will result in depleting its revenue so that it will not derive from such intrastate passenger business, over and above taxes and the fair or actual cost of doing the business, any fair or reasonable return upon the proportionate value of its property in Michigan necessary, for, and used in, the conduct of its intra-state passenger business therein which the rates, fares and charges prescribed in said Act specifically cover. Such rates, fares and charges as applicable to your orator and its business are unreasonable and too low, and the enforcement of the same against your orator will result in depriving it of its property without due process of law, and will deny to it the equal protection of the laws, in violation of the fourteenth amendment of the Constitution of the United States, and therefore the said Act is, as to your orator, null and void.

VIII.

Your orator has no remedy at law, and unless the defendants and each of them, be by a temporary restraining order restrained, and thereafter temporarily and permanently enjoined, as hereinafter prayed, it will suffer great and irreparable loss and damage.

IX.

In consideration whereof, and forasmuch as your orator is remediless in the premises by the strict rules of the common law, and can have relief only in a court of equity where matters of this kind are properly cognizable and relievable, and where only questions of this sort may properly be tried and determined,

Your orator prays, 1, That said Act of the Legislature of Michigan approved May 2, 1911—being Act No. 276 aforesaid,—insofar as it attempts to prescribe compensation for transporting passengers and their baggage at less than four cents per mile for a dis-
17 tance not exceeding ten miles, or less than three cents per mile for all other distances for passengers twelve years of age or more, and one-half those rates for children of twelve years or under, be declared and adjudged to be in violation of the Constitution of the United States, and therefore void and of no effect, so far as your orator, the Duluth, South Shore & Atlantic Railway Company, its officers, directors, agents and employes, are concerned:

2. That said Franz C. Kuhn, the Attorney General of the State of Michigan, be temporarily, until the final determination of this suit, and thereafter permanently, restrained and enjoined from instituting, or causing to be instituted, in the name of the state, his own name, as Attorney General or otherwise, any suit, action, or proceeding, to compel your orator, its officers, directors, agents or employes, to put in force, or to maintain or keep in force on the lines of your orator, any of the rates, fares or charges in said Act 276 prescribed, or for the recovery of any penalty on account of any failure or refusal on the part of your orator, its directors, officers, agents or employes, to put in force or to apply such rates.

3. That the defendants Cassius L. Glasgow, George W. Dickinson and Lawton T. Hemans, individually and as Commissioners constituting the Michigan Railroad Commission, be temporarily, until the final determination of this suit, and thereafter permanently, restrained and enjoined from in any manner enforcing or attemptig to enforce against your orator, its officers, directors, agents or employes, the rates, fares and charges prescribed in said Act 276, or attempting to enforce or collect any penalty on account that your orator fails or refuses to put in effect such rates, fares and charges, either by giving the notification referred to in subdivision Ninth of said Act, or by requesting or directing the Attorney General, or the Prosecuting Attorney of any County of the State of Michigan,
18. to institute or prosecute any suit, action or proceeding for the purpose of compelling your orator to put in force, or keep in force, the said rates, fares and charges, or by requesting or directing them, or either of them, to institute any action, suit or proceeding to collect or enforce any penalty for the refusal to put in force such rates, fares and charges.

4. And that the defendants John R. Van Evera, Morgan W. Jopling and Fred S. Case, and all other persons who desire to become passengers on your orator's railroad in Michigan, be temporarily and

permanently enjoined and restrained from demanding that the rates, fares and charges prescribed by said Act be given to them or any of them, and from asking, claiming or demanding, in or by any suit, action or proceeding whatsoever, any damages or penalty from or against your orator, its officers, directors, agents and employes or employe, on account of any failure or refusal to give them or either of them, or to put in effect and maintain the said rates, fares and charges;

5. And that your orator have such other and further relief as may be meet and proper, and conformable to equity.

6. And may it please your Honors to grant unto your orator a writ of subpœna of the United States of America, issuing out of and under the seal of this Honorable Court, directed to the said Franz C. Kuhn, Cassius L. Glasgow, George W. Dickinson, Lawton T. Hemans, John R. Van Evera, Morgan W. Jopling, and Fred S. Case, commanding them, and each of them, on a day certain therein to be named, and under a certain penalty, to be and appear before this Honorable Court, then and there to answer, but not under oath (answer under oath being expressly waived), all and singular the premises, and to stand to, and perform, and abide by such order, direction and decree, as may be made against them in the premises.

7. And that pending the hearing on the application for interlocutory injunction under the provisions of the Act of Congress approved June 18, 1910, a temporary order may be issued re-
19 straining the said defendants, and each of them, as above prayed.

And your orator will ever pray.

DULUTH, SOUTH SHORE & ATLANTIC RAILWAY COMPANY,
By ARCH B. ELDREDGE,
Its Vice-President.

A. B. ELDREDGE,
Marquette, Mich.;
PIERCE BUTLER,
St. Paul, Minn.,
Solicitors for Complainant.
JARED HOW,
WILLIAM D. MITCHELL,
Of Counsel, St. Paul, Minn.

20 STATE OF MICHIGAN,
County of Marquette, ss:

I, Arch B. Eldredge, on oath, say that I am a Director, the Vice-President and General Attorney of the Duluth, South Shore & Atlantic Railway Company, the complainant above named, and one of its Solicitors herein; that I have read the foregoing bill of complaint, and know the contents thereof; that the same is true of my own knowledge, except as to those matters therein stated upon informa-

tion and belief, and as to those matters I believe it to be true; that I have subscribed the said bill and made this verification by authority from the said complainant.

ARCH B. ELDREDGE.

Subscribed and sworn to before me this 24th day of July, 1911.
[NOTARIAL SEAL.] W. J. ELLISON,
Notary Public in and for said County.

My commission expires Jany. 27th, 1912.

Order Extending Time for Return on Order to Show Cause, etc.

At a Session of the Circuit Court of the United States for the Eastern District of Michigan, Continued and Held, Pursuant to Adjournment, at the District Court-room, in the City of Detroit, in said District, on Tuesday, the Twenty-sixth Day of September, in the Year of our Lord One Thousand Nine Hundred and Eleven.

Present: The Honorable Loyal E. Knappen, United States Circuit Judge; the Honorable Arthur C. Denison, United States District Judge, and the Honorable Alexis C. Angell, United States District Judge.

No. 4117.

THE DULUTH, SOUTH SHORE & ATLANTIC RAILWAY COMPANY, Complainant,

vs.

FRANZ C. KUHN, CASSIUS L. GLASGOW, GEORGE W. DICKINSON, Lawton T. Hemans, John R. Van Evera, Morgan W. Joplin and Fred S. Case, Defendants.

In this cause on reading and filing stipulation by and between counsel for respective parties, and on motion of A. B. Eldredge, Esq., solicitor for complainant, and Franz C. Kuhn, solicitor for defendants named, it is by the court now here ordered that the hearing upon the order to show cause, made and entered herein on the 26th day of July, A. D. 1911, by the Honorable Alexis C. Angell, District Judge, be and the same is hereby adjourned until the 16th day of January, A. D. 1912, unless the so-called Minnesota Rate Case, now pending in the Supreme Court of the United States and set for hearing on the 10th day of October, A. D. 1911, shall have been sooner decided, in which case either party shall be at liberty to move the court to advance the day of hearing.

22 And it is further ordered, in accordance with said stipulation, that the restraining order issued on the said 26th day of July, A. D., 1911, by the said Honorable Alexis C. Angell, District Judge, shall be continued in force until the hearing above provided for.

And it is further ordered, that after the 20th day of October, A. D., 1911, the said Complainant issue to each person buying Michigan intra-state passenger transportation, a receipt, certificate, or agreement, in form approved by the Attorney General of the State of Michigan, by which it binds itself to refund any amount paid for such transportation in excess of two cents per mile, and in case of children under twelve years of age in excess of one cent per mile, if this court shall finally decree that the rates, fares and charges provided for in Act of the Legislature of the State of Michigan, approved May 2nd, 1911, and known as Act number 276 of that year, is valid and enforceable against the said Complainant.

(Sgd.) LOYAL E. KNAPPEN,
United States Circuit Judge.

(Sgd.) ARTHUR C. DENISON,
United States District Judge.

(Sgd.) ALEXIS C. ANGELL,
United States District Judge.

23 3.

Answer.

UNITED STATES OF AMERICA:

The Circuit Court of the United States for the Eastern District of Michigan, Southern Division. In Equity.

No. 4117.

DULUTH, SOUTH SHORE & ATLANTIC RAILWAY COMPANY, Complainant,

vs.

FRANZ C. KUHN, CASSIUS L. GLASGOW, GEORGE W. DICKINSON, Lawton T. Hemans, John R. Van Evera, Morgan W. Jopling and Fred S. Case, Defendants.

The defendants Franz C. Kuhn, Cassius L. Glasgow, George W. Dickinson and Lawton T. Hemans, reserving to themselves all right of exception to the said bill of complaint, and without intent to represent or to answer for or to bind the state of Michigan in any way, for answer thereto say:

(1) That they admit the things stated in paragraph I of said bill of complaint to be substantially true as therein set forth, except that they have no knowledge or information upon whether the principal business of the complainant consists of inter-state commerce, but leave the complainant to its proofs with regard thereto.

(2) That they admit the statements contained in paragraph II of said bill of complaint to be substantially true as therein made, except that they have no knowledge with regard to the three defendants, John R. Van Evera, Morgan W. Jopling and Fred S. Case or the facts stated with reference to such defendants, but that they believe, upon such information as they now have, the things stated with regard to the said defendants to be true.

(3) That they admit the statements contained in paragraph III of said bill of complaint to be substantially true as
24 therein made, except that for distances in Michigan not exceeding five miles three cents per mile may under said Act 276 of the Public Acts of 1911, be charged for the carriage of passengers over twelve years of age, and one-half of that amount for children of the age of twelve years or under.

(4) That they admit that if this proceeding is properly instituted and is not a suit against the state of Michigan, it is a suit in equity arising under the Comstitution of the United States, and that the matter in dispute exceeds, exclusive of interests and costs the sum of $2,000, but that they deny that said Act 276 of the Public Acts of 1911, is violative of the provisions of the Fourteenth Amendment to the Constitution of the United States or that it will operate to deprive the complainant of its property without due process of law, or to deny to it the equal protection of the laws, and aver that the said act is constitutional and valid.

(5) That they admit that the said defendant Franz C. Kuhn, intends to and will, unless restrained, proceed against the complainant and its representatives to compel it and them to put and keep in effect the rates, fares, and charges prescribed in said act; that he admits that the defendants, Glasgow, Dickinson and Hemans will give (and have already given) to complainant the notice provided for in said act in case the complainant fails or refuses to put into effect and maintain the said rates, fares and charges, and will cause proceedings to be instituted for the recovery of the penalty provided for by statute; that they admit that persons entitled to travel over said railroad of complainant at the rates, fares and charges fixed in said act, are entitled in case of refusal to carry at such rates and charges, to proceed against the complainant for the penalty fixed by statute for the refusal to carry at such rates and charges; that they believe that the persons named are members of
25 the class entitled to bring such proceedings, though they have no direct information thereon, but that they deny that the complainant will be harassed by or subjected to, a multitude of such actions commenced to recover penalties; that they admit that the determination of the validity of the rates, fares and charges where the validity is contested involves the examination of a large number of complicated facts, and that in order to say positively that such rates are sufficient and accord to the complainant a fair return upon the value of its property, it is essential to determine and know the value of complainant's entire property, its value in Michigan, the proportionate value thereof used and to be used for the transportation of inter-state and intra-state passengers in Michigan, the amount

of earnings accruing to the complainant upon its line in Michigan, and the amount thereof derived from inter-state and intra-state transportation in Michigan respectively, the detailed amount of expenses for the operation of complainant's line and the division thereof between the states in which such line is located, together with numerous other facts and things bearing upon the amount of complainant's property in Michigan and the amount of earnings which will be permitted thereon from the intra-state business, all of which are necessary to be determined before it can be decided that the complainant will not receive any or adequate compensation from all of its business or from its intra-state business in Michigan, but that they deny that it is essential to ascertain and determine the amount of earnings allowable to the freight and passenger business in Michigan as separate and distinct items, the amount of earnings derived from the transportation of intra-state and inter-state passengers in Michigan separate from the earnings derived from all transportation in Michigan or the apportionment of various miscellaneous items to the inter-state and intrastate passenger business in
26 Michigan or the division of the operating expenses between the freight and passenger business of the complainant or the division between the inter-state and intra-state passenger business separate and apart from the entire intra-state business of the complainant in Michigan, or the apportionment of taxes paid in Michigan between the passenger business and the freight business of complainant in Michigan, or the apportionment of the amount of taxes charged against the complainant in Michigan between its intra-state and inter-state business as separate items from its entire intra-state business including both freight and passenger business in Michigan, but avers that the question for determination in ascertaining the reasonableness of the rates, fares and charges permitted to be charged by the complainant involves the inquiry of whether upon the entire property of the complainant devoted to its intra-state transportation and from business in Michigan a fair and sufficient return will be paid.

That they have no knowledge or information as to the examination which is being conducted by the accounting department of the complainant's railroad, but believe that such examination is being conducted, and that they deny that the profit from the complainant's business in Michigan will be so slight that the carriage of passengers at the rates fixed in said Act 276 of the Public Acts of 1911, will amount to a confiscation of its property.

That they deny that the average number of passengers carried by complainant daily on its line between stations in Michigan is about 1900, and that there is no reason for believing that it will be less in the future, but deny that if the complainant is in good faith and for the preservation of what defendant's representatives honestly believe to be its rights, institutes an inquiry or proceeding to determine the sufficiency of the rates, fares and charges, it would be subjected to a penalty of $100.00 a day to each passenger whom

27 it shall refuse to carry at two cents per mile, and deny that its liability therefore will be $190,000 per day, and deny that the necessary result of such penalty will be to deprive complainant of the right to a judicial determination of the validity of said rates and charges, or that it would therefore or thereby be deprived of its property without due process of law, or be denied the equal protection of the laws.

(6) That in so far as the said bill refers to the basis for fixing rates, fares and charges for the transportation of passengers as being three cents per mile, and in so far as it refers to specific fares between the points designated in the said paragraph or refers to the assignment now made of the revenues upon inter-state traffic between Michigan and other states or to the propriety of such assignment as is made in said bill, they have no knowledge, information or belief, but leave the complainant to its proofs with regard thereto, except that they aver and charge that the direct or necessarily incidental result of the said reduction of rates will not be to reduce to any extent the inter-state rates, and that the laws of Michigan since 1907 have fixed three cents per mile as the rate for the carriage of passengers, except children entitled to travel at half fare within the territory traversed by the complainant's lines, and that before 1907 four cents per mile was the charge permitted by statute, and they deny that such rates, fares and charges have never been excessive or unreasonably high and that they have always been so low as not to yield, over and above the cost of doing the business, any just or reasonable return to complainant on the fair proportionate value of its property used in the conduct of its passenger business and properly assignable thereto.

That they admit that the rates, fares and charges for the passenger business of the complainant made up of travel between
28 points on its line within Michigan and points beyond the limits of Michigan are made, filed and published in accordance with the requirements of the act to regulate commerce as amended, and are the only rates, fares and charges which may be legally applied thereto; they deny that the direct and immediate or necessarily incidental effect of the installation of the said rates, fares and charges so prescribed in said Act 276 will be to deprive complainant of a substantial part or any part, of its inter-state passenger business between points on its line in Michigan and points outside of Michigan, for the reasons stated in said bill or for any other reason and deny that a large part or any part of the complainant's inter-state passenger business will be destroyed, or the earnings therefrom decreased, by the application of the rates, fares and charges fixed in said act 276, or that the amount thereof will be the greater part of its interstate passenger business, or that if the said complainant is forced by the application of said act to carry any or all of its interstate passenger business at lower rates than it now receives therefor, that such reduction constitutes or will constitute a valid objection to the validity of said act.

That they deny that the immediate, direct and necessary or necessarily incidental effect of the installation of the rates, fares and

charges prescribed in said act 276 will be to create unfair and unjust discrimination in favor of the passenger business of complainant local to the state of Michigan, and against all its passenger business between Michigan and other states, or between Michigan and Canada, or which is made up of travel and routes partly within and partly without said state, or that the same will constitute unfair and unjust discrimination in favor of localities on complainant's line within Michigan, and against localities outside thereof.

That they deny that the unavoidable effect of the reduction
29 of the intra-state passenger rates, fares and charges in said act 276 prescribed, upon the business of the complainant in Michigan will be substantially to burden and to discriminate against the inter-state passenger commerce of complainant, or create undue and unjust discrimination between localities in Michigan and those in other states in violation of the said Constitution or laws of the United States.

(7) That the statements contained in paragraph VII of the said bill relate, for the most part, to matters not within the knowledge of the defendants, and with regard to which they have no information, but which are peculiarly and particularly within the knowledge of the complainant; that the statements made in such paragraph depend largely, and almost entirely, upon facts, accounts and figures in the possession and under the control of the complainant, and to which these defendants have not had, nor been offered, access as original sources of information; that the knowledge of the truth of the statements made in said paragraph depend almost entirely upon the examination of intricate and compiicated accounts which are only in the possession of the complainants and upon the making of extensive examinations of the complainant's books, papers and property; that none of these defendants have ever made, and have not been given leave by the complainant to make, such examination, and they have not, since the filing of said bill had any opportunity to make the same; that the only information which these defendants have with regard to the statements made and the facts upon which the same are based is that which is derived from the reports made by the said complainant to public officials and that resulting from examinations of its property made a number of years ago by the representatives of the state for the purpose of placing values thereon for taxation in Michigan, and that they believe upon such examination and knowledge so acquired that many of the statements made in said paragraph
30 are untrue both as statements of facts and as conclusions drawn therefrom; that they believe from such examination as they have been able to make and charge the truth to be that the statements contained in said paragraph, whether taken separately or collectively, do not fully or fairly represent the facts or state the truth; that the things and conclusions stated in said paragraph are in all instances stated in such a manner as to appear to be, and to be, of the most advantage to the complainant, and that many things might properly be and should be added to the statements made and things stated which, if stated, would change the character, import and effect of those stated, and for those reasons these defendants deny each and

all of the statements contained in the said paragraph numbered VII of said bill, and leave complainant to its proofs with regard thereto.

That in addition the defendants specifically deny that the value of the complainant's property devoted to its transportation business in Michigan is now and for several years last past has been actually, fairly and reasonably of the value of $11,000,000, or that the same could not be reproduced for that sum if proper allowance were made for depreciation, and deny that the proportionate value of the complainant's property within Michigan which now and for some years past has been, fairly chargeable and assignable to the total passenger business of complainant in Michigan, is at least $3,600,000, and deny that the proportionate value of its said property within the state of Michigan which now and for some years past has been fairly and justly chargeable and assignable to the intra-state passenger business of complainant within Michigan which is covered by the rates, fares and charges in said act 276 prescribed, is at least $2,048,000, and deny that the total operating revenue of the
31 complainant, both passenger and freight including all miscellaneous earnings of every kind, did not for 1910 exceed the sum of $3,302,147.03, or that the revenues in Michigan did not exceed $2,896,602.50, or that the said revenue is in said paragraph properly assigned between the freight and passenger business of the complainant in Michigan or between the inter-state and intra-state passenger business of the complainant in Michigan, and deny that in said year the total operating expenses and taxes of the complainant equaled $2,491,778.16, or that the same are properly assigned in said paragraph to the Michigan business, or between the freight and passenger business in Michigan or between the inter-state and intra-state passenger business in Michigan, and they deny that the total net income over and above operating expenses derived from the total business of complainant, including outside operations, rental and hire of equipment did not exceed $794,395.23, or that said net income is in said paragraph properly assigned to Michigan in the sum of $770,694.92, and that the true income in Michigan did not exceed that sum, and that the net income is properly assigned in said paragraph between the passenger and freight departments in Michigan, or between the inter and intra-state passenger business in Michigan, and that the total net income derived from the intra-state passenger business in Michigan including a fair and just proportion of miscellaneous earnings, outside operations, rentals, and hire of equipment, did not exceed $113,740.14; that they deny that there is no reason to believe that the passenger traffic on the complainant's lines in Michigan will increase substantially in the near future for the reasons stated in said paragraph or for any other reasons, or that upon the rates, fares and charges prescribed in said act 276, it will be impossible to secure an average of two cents per passenger mile upon its traffic in Michigan, or more than 1.8 cents per passenger mile, and deny that the putting into effect of
32 said rates will result in the diminution of revenue stated in said paragraph or of any diminution of revenue, but that

these defendants believe that the putting into effect of said rates will result in an increase in the number of passengers carried, sufficient to offset any loss by the reduction of rates, upon the number of passengers now carried, and deny that the putting into effect of said rates will result in such a reduction of complainant's revenues from its intrastate passenger business that it will not derive from such business after the payment of taxes and expenses of doing such business, any fair or reasonable return upon the proportionate value of its property in Michigan necessary for and used in the conduct of its intra-state passenger business, and deny that such rates, fares and charges as applicable to complainant and its business are unreasonable or too low or that the enforcement of the same against complainant will deprive it of its property without due process of law, or deny to it the equal protection of the laws or violate the Fourteenth Amendment.

That they admit that the complainant was, prior to 1907, by law permitted to charge four cents per mile for passenger travel, in Michigan, except for children under the age of twelve years, and that a statute taking effect in September 1907, reduced this rate to three cents per mile; that complainant has always transported children under the age of twelve years and clergymen at one-half the regular fare, and has given excursion and party rates to a considerable number of passengers at less than the regular fare, and that competitive conditions have existed which have rendered it impossible for the complainant to secure its maximum regular fares on certain of its business, but denies that said competitive conditions will be such as to require the complainant in future to carry any of its passengers, except children, at less than two cents per mile as prescribed by statute.

33 That they aver that the fair and reasonable value and cost of reproduction and allowing for depreciation, of the property of complainant, devoted to its business in Michigan, is the sum of $9,600,000; that the rates permitted to complainant in Michigan will pay an ample and sufficient return thereon after the payment of all expenses properly chargeable against the same, and that the earnings upon its passenger business at the rates fixed in act 276 will be ample and sufficient to pay a fair and reasonable return upon the value of such portion of the complainant's property in Michigan as is devoted to its intra-state passenger business.

(8) That they deny the statements contained in paragraph VIII of said bill.

(9) These defendants further answering, respectively represent and show;

(*a*) That this proceeding is in effect a suit against the State of Michigan, and that he, whether as Attorney General or member of the railroad Commission, has no personal interest in the said statute or in the subject matter of said bill, except as an officer of and representing the state of Michigan.

(*b*) That the said rates permitted by said act to be charged for the carriage of passengers are, together with the other moneys and

income permitted to be earned by the complainant in Michigan, sufficient to constitute a fair and sufficient return upon the value of its property in Michigan devoted to the public service and upon the property engaged in its passenger business, and that the said act 276 of 1911 fixing rates for the carriage of intra-state passengers within the state of Michigan at two cents per mile is valid, legal and constitutional.

(*c*) That by reason of the reduction of passenger fares upon the line of the said complainant in Michigan from the sum of
34 three cents per mile as heretofore to two cents per mile, will result in stimulating the traffic and so increasing the business of complainant within the state of Michigan as to make up for any loss which may result upon specific passengers from the reduction to two cents per mile, and that a fair trial of the said rates by putting them into effect will, in the judgment of each of these defendants, demonstrate that said reduction will result in an increase rather than a decrease of earnings from the passenger business.

(*d*) That said complainant has not stated such a case as entitles it to the relief prayed for, and that the said bill should be dismissed with costs.

Order Appointing Special Master.

This cause came on for hearing on the 17th day of May, 1912, upon the motion of complainant that a Special Master be appointed and that a time for taking the testimony herein be fixed. Mr. A. B. Eldredge, Mr. Pierce Butler appeared for the complainant. Mr. Franz C. Kuhn, the Attorney General, and Mr. Roger E. Wykes appeared for the defendants, and after hearing the parties and due consideration, it is ordered that Herbert L. Baker, of Detroit, Michigan, be and he is hereby appointed Special Master in Chancery in this case.

The Special Master hereby appointed is empowered and directed to take and report to the Court the evidence in this cause.

The Special Master hereby appointed is empowered and directed to examine the evidence, to make the necessary computations, and to find and state the facts in this case, and to make a report to this Court of the facts so found and of the results of such computations, and to recommend to the court in his report a form of a proper decree herein, all pursuant and subject to the rules and practice in equity.

It is further ordered that, upon the completion of his findings of fact and report, the Special Master shall notify counsel for the respective parties thereof, and shall exhibit said report to them, and shall deliver to them copies thereof, that each of the parties to this suit may thereupon file exceptions to the report with the Master within thirty (30) days after notice of its completion, and the Master shall thereupon consider and sustain or overrule each of said
38 exceptions, and shall thereafter return to the Court his report, the said exceptions, his rulings thereon, and any modifications of or additions to his report he may deem it just and proper to make, in view of such exceptions.

Upon the filing of such report and exceptions, the cause shall stand for hearing before the Court upon the said exceptions, as though they had been made at the time specified in Rule 83 in Equity, but further exceptions may be filed by any party to the suit within one month from the time of the return of said report to the Court.

It is further ordered, that the time in which complainant shall take its evidence in support of its bill is fixed at and limited to ninety (90) days from the date hereof; that the time within which the defendants shall take their evidence in defense herein is fixed at and limited to one hundred twenty (120) days thereafter; that the time within which the complainant shall take its evidence in rebuttal is fixed at and limited — thirty (30) days after the closing of the testimony for the defense and notice thereof in writing.

And it is further ordered, that the Master may appoint subject to the approval of the parties, a stenographer or stenographers, who shall be authorized to take and transcribe under the direction of the Special Master, the testimony in this case.

Opinion on Motion for Preliminary Injunction.

In the District Court of the United States for the Eastern District of Michigan, Southern Division. In Equity.

No. 4117.

THE DULUTH, SOUTH SHORE & ATLANTIC RAILWAY COMPANY, Complainant,

vs.

FRANZ C. KUHN, Attorney General of the State of Michigan, et al., Defendant-.

Before Knappen and Denison, Circuit Judges, and Angell, District Judge.

The judges who heard this motion think it probable that the decision of the Supreme Court in the pending so-called, Rate Cases, including Minnesota and Kentucky cases, will be instructive, if not controlling, as to the proper disposition of this motion. The Supreme Court will announce decisions on June 10th next, and it seems to us advisable to delay until after that date any decision upon the questions argued here. Whether our decision should be then further delayed in case the Supreme Court does not dispose of the Rate Cases on June 10th, we then can consider.

The restraining order will for the present be continued until June 28th next. This continuation, and any further continuations, will be upon two conditions: The first condition will be that the Complainant will speed the cause by proceeding with its testimony as

rapidly as may be. The second condition will be that the payment of the receipts which the Railroad Company is now issuing under our previous order for the excess over two cents per mile (and one cent in the case of children), be secured by filing in this cause
40 a bond in the sum of Two Hundred Thousand Dollars ($200,000) so that any holder of these excess certificates may resort through this court to such bond.

Order Continuing Preliminary Injunction Conditionally.

At a Session of the District Court of the United States for the Eastern District of Michigan, Continued and Held, Pursuant to Adjournment, at the District Court-room, in the City of Detroit, in said District, on Wednesday, the Twenty-ninth Day of May, in the Year of Our Lord One Thousand Nine Hundred and Twelve.

Present: The Honorable Loyal E. Knappen, Circuit Judge; the Honorable Arthur C. Denison, Circuit Judge; the Honorable Alexis C. Angell, District Judge.

In Equity.

No. 4117.

THE DULUTH, SOUTH SHORE & ATLANTIC RAILWAY COMPANY,
Complainant,

vs.

FRANZ C. KUHN, Attorney General of the State of Michigan, et al.,
Defendants.

The court having by an order entered on September 26th 1911 extended the operation of the restraining order entered herein on July 26th 1911 upon condition, which has since been fulfilled, that the Complainant should issue to each person buying Michigan intrastate passenger transportation, a receipt, certificate or agreement, in form approved by the Attorney General of the State of Michigan, by which it should bind itself to refund any amount paid for such transportation in excess of two cents per mile, and in case of children under twelve years of age any amount in excess of one cent per mile,

if this court should finally decree that the rates, fares and charges provided for in Act 276 of the Public Acts of the State of Michigan for 1911 are valid and enforceable against said Complainant; arguments upon the propriety of issuing an interlocutory injunction having been heard; and a decision not having as yet been handed down by the Supreme Court of the United States in the case mentioned in said order of September 26th, 1911.

42 It is by the Court Ordered that the restraining order heretofore issued and continued as aforesaid, be further continued until June 28th next upon the following conditions, viz: First, that the taking of testimony by the Complainant in said cause proceed with all reasonable speed; and Second, that, in addition to the issuance of the receipts, certificates or agreements to passengers, within twenty days from this day the Complainant file a bond in the full sum of Two Hundred Thousand Dollars ($200,000) with sufficient surety or sureties, to be approved by the Clerk of this court, and to run to the said Clerk for the benefit of the holders of such receipts, certificates or agreements, and conditioned that within such time and under such conditions as the court may hereafter order, the Complainant shall pay into court the full amount of such receipts, certificates or agreements as may be filed or presented in this court under the provisions of any order hereafter, entered herein.

44 District Court of the United States for the Eastern District of Michigan, Southern Division. In Equity.

No. 4117.

DULUTH, SOUTH SHORE & ATLANTIC RAILWAY COMPANY, Complainant,

vs.

FRANZ C. KUHN, Attorney General of the State of Michigan, et al., Defendants.

Know all men by these presents, That we, The Duluth, South Shore & Atlantic Railway Company, a corporation organized under the general railroad laws of Michigan, as principal, and Maryland Casualty Company, a corporation organized under the laws of Maryland, as surety, are held and firmly bound unto Elmer W. Voorheis, Clerk of the U. S. District Court for the Eastern District of Michigan, Southern Division, in the sum of Two Hundred Thousand Dollars ($200,000), lawful money of the United States, to be paid to the said Elmer W. Voorheis, or to his lawful successor in office, for the use and benefit of the holders of all receipts, certificates or agreements, hereinafter more particularly described; for which payment, well and truly to be made, we bind ourselves, our and each of our successors; jointly and severally, firmly by these presents.

Sealed with our seals, dated the sixth day of June, one thousand, nine hundred and twelve.

Whereas, the above bounden Duluth, South Shore & Atlantic Railway Company, on July 26, 1911, commenced a suit in Equity, in the Circuit Court (now District Court) of the United States for the Eastern District of Michigan, Southern Division, against the above named defendants, to enjoin the enforcement of Act No. 276 of the
45 Public Acts of 1911 of the Legislature of Michigan, approved May 2, 1911, as against said complainant; and,

Whereas, on July 26, 1911, the said Court entered an order restraining, until the further order of the Court, the said defendants from enforcing, or attempting to enforce in any manner, the provisions of said Act against said complainant, reference to which said restraining order, now on file in said Court, is hereby made for greater particularity; and,

Whereas, the said Court, by an order entered in the above entitled cause on September 26, 1911, extended the operation of said restraining order until January 16, 1912, upon condition, which has since been fulfilled, that the complainant therein should issue to each person buying Michigan intrastate passenger transportation a receipt, certificate or agreement in form approved by the Attorney General of the State of Michigan, by which it should bind itself to refund any amount so paid for such transportation in excess of two cents per mile, and in case of children under twelve years of age any amount in excess of one cent per mile, if the said Court should finally

decree that the rates, fares and charges provided for in said Act 276 are valid and enforceable against said complainant; and,

Whereas, on January 16, 1912, the said Court entered a further order continuing the said restraining order until May 29, 1912; and,

Whereas, on May 29, 1912, the said Court entered a further order continuing the said restraining order until June 28, 1912, upon certain conditions therein set forth, including the filing of this bond:

Now, therefore, the condition of this obligation is such, That if the above bounden Duluth, South Shore & Atlantic Railway Company, within such time and under such conditions as the said Court may hereafter order, pay into Court the full amount
46 due upon all such receipts, certificates or agreements hereinbefore described, as may be filed or presented in said Court under the provisions of any order hereafter entered in said cause, then this obligation to be void, else to remain in full force and virtue.

Power of Attorney from Maryland Casualty Company to —— ——.

Know all men by these presents: that Maryland Casualty Company, a corporation created by and existing under the Laws of the State of Maryland, of the City of Baltimore, Maryland, and duly authorized to act as sole surety in the State of Michigan, has made, con-

stituted, and appointed and by these presents doth make, constitute and appoint Peter White Phelps or Harlow A. Clark its true and lawful attorney for and on behalf of the said corporation as surety, to make, sign and acknowledge a Bond in the penalty of two hundred thousand ($200,000.00) dollars to be executed by Duluth South Shore & Atlantic Railway Company, as Principal, conditioned for payment by said Railway Company to Clerk of U. S. District Court, Eastern District of Michigan, within such time and under such conditions as the Court may hereafter order (in the case now pending in said Court of said Railway Company vs. Franz C. Kuhn, Attorney General of the State of Michigan, and others) the full amount due upon all such receipts, certificates or agreements issued by said Railway Company pursuant to the order of said Court in said cause, dated Sept. 26, 1911, as may be filed or prescribed in said Court under the provisions of any order hereafter entered therein, hereby approving, ratifying and confirming all that its said attorney may do or lawfully cause to be done in the premises by virtue of these presents.

In witness whereof Maryland Casualty Company has caused these presents to be signed by —— —— Vice President of said Company and its corporate seal to be hereunto affixed this the sixth day of June 1912.

MARYLAND CASUALTY COMPANY,
(Signed) By JAS. W. STONE, *Vice-President.*

Extract from the By-Laws.

Article IV, Section V. The President, or any of the Vice-Presidents, shall have power by and with the concurrence of the Secretary or any one of the Assistant Secretaries, to appoint any attorney in fact or to authorize any person or persons to execute on behalf of the Company, any bonds, recognizances, stipulations, undertakings, deeds, releases of mortgages, contracts, agreements and policies, and to affix the seal of the Company thereto.

I, James F. Mitchell, Secretary of the Maryland Casualty Company, do hereby certify that the above and foregoing is a full, true and correct copy of Article IV, Section V, of the by-laws of the Maryland Casualty Company, as the same appears on the records of the Company now in my possession and custody.

In witness whereof, I have hereunto set my hand and affixed the seal of said Company at the City of Baltimore, this sixth day of June, A. D. 1912.

Motion for Order Permitting Appearance.

United States District Court, Eastern District of Michigan, Southern Division. In Equity.

No. 4117.

DULUTH, SOUTH SHORE & ATLANTIC RAILWAY COMPANY, Complainant,

vs.

GRANT FELLOWS, CASSIUS L. GLASGOW, LAWTON T. HEMANS, C. S. CUNNINGHAM, et al., Defendants.

Now come Grant Fellows, Attorney General of the State of Michigan and Roger I. Wykes of Counsel, representing the unnamed and unknown persons who may become or desire to become passengers upon the complainant's railroad, and move the court for an order nunc pro tunc as of the date of the appearance of the several state officers herein, permitting the above named solicitors to appear for such class, and the individuals constituting the same (except John R. Van Evera, Morgan W. Joplin and Fred S. Case) and permitting such a class, (except the persons named) to stand upon and have full advantage of the answer, proceedings and testimony of, and taken on behalf of, the several state officers named as defendants herein, and who have appeared, answered, and participated in the defense hereof.

This motion is based upon the record and proceedings in said cause which indicate: that no appearance for such class has hereto-

fore been entered, and such class has not been defaulted nor have any individual members thereof, except John R. Van Evera, Morgan W. Joplin and Fred S. Case; that no change in the pleadings or proofs will be required or made necessary by accepting and permitting such appearances, and that the proceedings in such cause do not show that the defendants who have appeared or their silicitors have had any notice of the attempted default of the above named defendants, John R. Van Evera, Morgan W. Joplin or Fred S. Case.

On behalf of the defendants who have appeared herein, and
51 the said Attorney General, and his counsel, it is hereby stated that no notice of the default of the last named persons or of their failure to appear in said cause, was ever served upon the state officers who are defendants herein, or upon their solicitors or any of them.

GRANT FELLOWS,
Attorney General.
ROGER I. WYKES,
Of Counsel.

52 12.

Stipulation Regarding Corporate and Land Grant History.

In the District Court of the United States for the Eastern District of Michigan, Southern Division. In Equity.

DULUTH, SOUTH SHORE & ATLANTIC RAILWAY COMPANY, Complainant,

vs.

GRANT FELLOWS et al., Defendants.

Subject to the objection of the complainant that the facts are irrelevant and immaterial, it is stipulated, by and between the above named parties, by their respective solicitors, as follows:

1. The Iron Mountain Railroad Company was a steam railroad incorporated in 1855 for a term of 100 years. Capital stock authorized $400,000. Surveyed in 1852 and completed in 1857. It ran from Marquette to Lake Superior Mine (Ishpeming) and other mines.

2. The Iron Mountain Railway Co., was a strap railroad incorporated in 1855. Capital stock authorized $140,000. Opened Nov. 1, 1855. Its projected termini were from Marquette to the Mines of Jackson Iron Mountain (14 miles). It was operated for 2 years and in 1857 consolidated with the Iron Mountain Railroad. Its corporate term expired March 10, 1885. The Iron Mountain Railroad and the Iron Mountain Railway were, after consolidation in 1857, sold in 1859 to Bay de Noquet and Marquette Railroad Co., which sale was confirmed by the act of February 15, 1859.

3. The May De Noquet and Marquette Railroad Co., was incorporated in 1856 under the act of February 12, 1855. Its corportae term was for 100 years and its capital stock authorized $1,500,000.

It received a land grant from the State of Michigan under the
53 Act of Congress of June 3, 1856, and the Michigan Act of February 14, 1857, the land grant being accepted by it March 25, 1857. The construction was approved by the Governor in 1862. the acreage of the original grant was 318,123.28, and of this 128,301.05 was patented by the state to the Marquette, Houghton and Ontonagon Railroad Co., the successor of the Bay de Noquet and Marquette Railroad Co., on account of the construction of the latter, Marquette to Ishpeming. The projected termini of the Bay de Noquet & Marquette Railroad were Marquette and Little Bay de Noquet. The road was completed from Marquette to Ishpeming (20 miles) on December 1, 1862. The Bay de Noquet & Marquette was, in 1871, consolidated under the Michigan General Railroad Law with the Marquette and Ontonagon Railroad Co. retaining the name of the latter. The contract of consolidation providing that the new corporation "shall be subject to all the restrictions and liable for all the contracts and indebtedness and perform all the duties imposed by law upon either or both the said corporations."

4. The Marquette and Ontonagon Railway Co., was incorporated in 1857 for a term of 500 years. Capital stock authorized $1,000,000. The projected termini were Marquette and Ontonagon (100 miles). This road accepted a land grant from the state of Michigan under the act of Congress of June 3, 1856, and the Michigan Act of February 14, 1857. There was no construction and the land grant was forfeited by the act of the Legislature of March 17, 1863.

5. The Marquette and Ontonagon Railroad Co., was incorporated in 1863 for a term of 99 years. Capital stock authorized $2,000,000. The projected termini were Marquette and Ontonagon, via L'Anse (125 miles) 20 miles of the road was constructed by November 17, 1865, from Ishpeming to Lake Michigamme (Champion). An amendment to the articles of association was filed in 1872, making the western terminus the westerly line of Section 9, T. 47, N., 30 W. (length 42 miles). By the Legislative act of March 17, 1863, the forfeited land grant of the Marquette & Ontonagon Railway Co., was

conferred upon the Marquette & Ontonagon Railroad Co.
54 This grant was later forfeited by the joint resolution of the Michigan Legislature of March 30, 1869, and the resolution gave the Michigan Board of Control of state swamp lands the power to confer the grant upon some other company. This Board of Control conferred the grant upon the Houghton and Ontonagon Railroad Company and this action was confirmed by the joint resolution of January 24, 1871.

There was patented to the Marquette, Houghton & Ontonagon Railroad Co., 153,690.27 acres on account of the Marquette & Ontonagon Railroad construction from Ishpeming to Champion.

6. The Houghton and Ontonagon Railroad Co., was incorporated in 1870 for a term of 999 years. Original capital stock $560,000; increased in 1872 to $1,200,000. The projected termini were a

point east of Lake Michigamme and Ontonagon. In 1872 the termini were changed to Marquette and Ontonagon and were again changed to Champion and Ontonagon. No construction. This company took the Marquette & Ontonagon Railroad forfeited grant as above set forth. By virtue of a contract entered into on September 1, 1871, with Peter Mitchell, Swamp Land State Road Commissioner for the Upper Peninsula, this company became entitled to the sum of $40,000, payable in state swamp lands. Under this contract, land to the amount of 32,000 acres was granted to various persons on order of the Marquette, Houghton and Ontonagon Railroad Company, which succeeded to the rights of the Houghton and Ontonagon Railroad Co.

7. The Houghton and L'Anse Railroad Co. was incorporated in 1881 for a term of 1000 years. Capital stock authorized $1,000,000. The projected termini were Houghton and L'Anse (32 miles). This company received from the state a grant of state swamp lands under the act of May 1, 1875. The grant passed and was patented to the Marquette, Houghton & Ontonagon Railroad Co., upon the consolidation of the Houghton and L'Anse Railroad, with the Marquette, Houghton & Ontonagon Railroad.

55 8. The Marquette, Houghton and Ontonagon Railroad Co., this corporation was formed in 1872 for a term of 999 years by consolidation of the Marquette and Ontonagon Railroad with the Houghton and Ontonagon Railroad under the Michigan General Railroad Law. Original capital stock $2,040,000, increased in 1874 to $5,000,000. The projected termini were Marquette and Ontonagon. The Governor on February 6, 1873, certified that the road between the completed portions of the Marquette and Ontonagon Railroad (Champion) and L'Anse (32 miles, plus 1390 ft.) was completed before December 31, 1872. In 1883, the Marquette, Houghton & Ontonagon Railroad was consolidated with the Houghton and L'Anse Railroad under the Michigan General Railroad Law under the name of the former. The road was opened from L'Anse to Houghton in 1883 (32.14 miles). The total mileage in 1872 was 84.34 miles; in 1887 it was 135.42 miles, as shown by reports.

The land grants patented to the Marquette, Houghton and Ontonagon Railroad were the following:

(A) Federal acts:

(1) The grant to the Bay de Noquet and Marquette Railroad Co., on account of construction from Marquette to Ishpeming..	128,301.05	acres
(2) The grant to the Marquette and Ontonagon Railroad on account of construction from Ishpeming to Champion	153,690.27	"
(3) The grant to the Marquette, Houghton and Ontonagon Railroad Co., on account of construction from Champion to L'Anse..	180,389.42	"
Total lands patented by state to Marquette, Houghton and Ontonagon Railroad on account of Federal Acts.....	462,380.74	"
Less amount necessarily included in the deed of release to the State, executed on April 8, 1874..	28,150.10	"
Net total lands received by Marquette, Houghton and Ontonagon Railroad Company, on account of Federal Acts..	434,230.64	"

56 (B) Under State swamp land contracts:

(1) On account of the grant to the Houghton and L'Anse Railroad Co., for the construction from L'Anse to Houghton.....	82,421.62	acres
(2) On account of grant to Houghton and Ontonagon Railroad Co., for construction from L'Anse to Nestoria, (patented to various people on order of Marquette, Houghton and Ontonagon Railroad Co.)	32,000.00	"
Total acres swamp land used or received by Marquette, Houghton and Ontonagon Railroad Co.	114,421.62	"

Of the public lands patented to the Marquette, Houghton and Ontonagon Railroad Co., there passed to the Duluth, South Shore & Atlantic Railway Company 82,385.29 acres (being the lands conveyed by that company to the South Shore Land Company, Limited). All the other granted lands of the Marquette, Houghton and Ontonagon Railroad Co. having been disposed of by the last named Company; of which lands so previously disposed of, about 386,000 acres were sold for a consideration of $2,400,000 during the year 1881.

9. The Marquette and Western Railroad Co. was incorporated in 1883, to compete with the Marquette, Houghton and Ontonagon Railroad. Capital stock authorized $1,250,000. Its termini were Marquette and Ishpeming (17.03 miles). Was purchased in 1885,

by the Marquette, Houghton and Ontonagon Railroad for the sum of $2,011,346.93, stocks and bonds being given in payment.

10. The Detroit, Mackinac and Marquette Railroad Co. was incorporated in 1879 for a term of 1000 years. Original capital stock authorized $1,200,000; amount paid in, in 1880, $5,360. The capital stock was increased in 1881, in 1882 and 1883 to a total of $10,000,000. The projected termini were Mackinac to Marquette (152 miles). The road was reported complete on December 15, 1881. This company received a state swamp land grant by the provision of Chapter 36 of the Public Acts of 1873, and subsequent acts extending the time for construction. The grant as made was 1,326,688.35 acres and the lands were patented in March and April 1882.

The Detroit, Mackinac and Marquette Railroad was sold under foreclosure on October 20, 1886, and was purchased for $1,010,000 by Hugh McMillan, whose deed was filed December 20, 1886. The patented lands of this company were separately mortgaged and passed to the mortgagees or their grantees. None of this land came into possession of the Duluth, South Shore & Atlantic Railway Company.

57

11. The Sault Ste. Marie & Marquette Railroad Co. was incorporated in 1880 for a term of 99 years. Capital stock authorized $300,000. Its projected termini were from a point on the Detroit, Mackinac and Marquette Railroad to Sault Ste. Marie (35 miles) all in Chippewa County. There was no construction.

12. Mackinac and Marquette Railroad Co. was incorporated in 1886 for a term of 999 years. Capital stock authorized $3,040,000. This company was organized by the *purchaser* at the foreclosure sale of the Detroit, Mackinac & Marquette Railroad pursuant to the provisions of Section 6224 of the Compiled Laws of 1897.

13. Duluth, Superior and Michigan Railway Co., was a Wisconsin corporation, incorporated in 1886. Capital stock authorized $6,500,000. Its projected termini were from West Superior to Montreal River, Township 47, Range 1 East. No construction.

14. The Wisconsin Sault Ste. Marie & Mackinac Railway Co. was incorporated in 1886 for a term of 99 years. Capital stock authorized $2,600,000. The proposed termini were the Montreal River, the dividing line between Michigan and Wisconsin, and Marquette, Michigan. No construction.

15. Duluth, South Shore & Atlantic Railway Co., was incorporated in 1887 under the Michigan General Railroad Law by the consolidation of the railroad companies described above in paragraphs 11, 12, 13 and 14 for a term of 99 years. Its capital stock is $22,000,000; $10,000,000 of preferred stock and $12,000,000 of common stock. By the law authorizing the consolidation the new company was required to become and "be subject to all the obligations and liabilities heretofore resting upon said several corporations so consolidated."

58

The Marquette, Houghton and Ontonagon Railroad was leased to the Duluth, South Shore & Atlantic Railway Co., in 1887, on the latter guaranteeing 6% on $3,278,456, now preferred stock and surplus net earnings to holders of common stock. This lease

was repudiated by the Duluth, South Shore & Atlantic Railway Co., stockholders and cancelled by both companies. On July 17, 1890, the Duluth, South Shore & Atlantic Railway Co., purchased all the property of the Marquette, Houghton and Ontonagon Railroad Co., except its franchise to be a corporation; the latter company having previously disposed of the larger portion of its lands, as hereinbefore set forth in paragraph 8 hereof; the Duluth, South Shore & Atlantic Railway Co., acquired and holds the entire capital stock of the Marquette, Houghton and Ontonagon Railroad Co., with the exception of a few hundred shares of stock which are still outstanding in the hands of the public.

16. The Dead River Railroad was constructed in 1889 and ran from a point on the Duluth, South Shore & Atlantic Railway near the west limits of the city of Marquette, about 3 miles northeasterly to reach the mill and yards of the Dead River Lumber Company. All the property of this company was purchased by the Duluth, South Shore & Atlantic Railway Co. in July 1907.

The following corporations are connected with the Duluth, South Shore & Atlantic Railway Co., through stock ownership or otherwise.

17. The South Shore Land Company Limited was organized in 1898 under the Michigan partnership association statute for the purpose of taking over and managing the lands received from the Marquette, Houghton and Ontonagon Railroad Co. Capital stock $3,000, all of which is owned by the Duluth, South Shore & Atlantic Railway Co. To this company was conveyed 82,385.29 acres of swamp land granted on account of the Marquette, Houghton and Ontonagon Railroad construction from Houghton to L'Anse.
59 Up to the time of the commencement of this suit 10,991.82 acres of said land had been sold by said company and it then held about 71,393.47 acres unsold.

18. The Mineral Range Railroad Co., was incorporated in 1871, under the name of the Mineral Range and L'Anso Bay Railroad Co. Its capital stock was $200,000 and on November 8, 1872, its stock was increased to $400,000 and its name changed to the Mineral Range Railroad Company. The stock was increased in 1901, 1903 and 1910 until it is now authorized at $1,500,000. Its projected termini were from Keweenaw Bay, via Houghton, to Calumet (45 miles). The proposed length was increased to 100 miles on November 18, 1872. The total mileage is 73.21. This company is controlled by the Duluth, South Shore & Atlantic Railway Co., through the ownership by the Duluth, South Shore & Atlantic Railway Co. of 53% of the capital stock of the Mineral Range Railroad Co.

19. The Hancock and Calumet Railroad Co. was incorporated in 1885, for a term of 50 years. Its projected length was 18 miles, from Portage Lake, via Lake Linden, to Red Jacket. In 1886, its length was increased 4 miles and capital stock increased to $350,000, and in 1899, the proposed length was increased to 50 miles. The total mileage is 33.14 miles. This road is controlled by the Mineral Range Railroad Co., by its ownership of the entire capital stock of the former. The road is leased by the Mineral Range Railroad Co.,

for the corporate existence of the Hancock and Calumet Railroad Co.

20. The Mohawk Mining Company Railroad. This railroad has a mileage of 16.7 miles and is owned by the Mohawk Mining Company. It is operated and maintained by the Mineral Range Railroad Company by a contract which expires on Decem' er 15, 1917, and calls for an annual rental, paid by the Mineral Range Railroad Co., to the Mohawk Mining Company of $2,700.

21. Canadian Pacific Railway Company. This company in July 1888 purchased majority holdings of the common and pre-
60 ferred stock of the Duluth, South Shore & Atlantic Railway Co. At present the Canadian Pacific Railway Co. holds $6,100,000 in common stock; $5,100,000 in preferred stock, the entire issue of the first consolidated mortgage bonds and the entire issue of the income bonds of the Duluth, South Shore & Atlantic Railway Co.

All of the incorporations above referred to, with the exception of that of the Canadian Pacific Railway Co., were under the general laws of the state of Michigan.

Dated this 7th day of December, 1914.

(Indorsement:) United States District Court, Eastern District of Michigan, Southern Division. Duluth, South Shore & Atlantic R. R. Co., vs. Grant Fellows, Attorney General, et al. Memorandum Order in re deposit in Clerk's Office of Bank receipts of 1/3 of Plaintiff's gross earnings. Filed Oct. 25, 1915, at — o'clock — M. (Signed) Elmer W. Voorheis, Clerk. (Not to be entered. E. W. V.)

62 United States District Court, Eastern District of Michigan, Southern Division. In Equity.

At Chambers in the City of Grand Rapids, on the 22nd day of Octo'er, 1915, there being present: Circuit Judges Loyal E. Knappen and Arthur C. Denison, and District Judge Clarence W. Sessions.

Former C. C. No. 4117.

DULUTH, SOUTH SHORE & ATLANTIC RAILWAY COMPANY, Complainant,

v.

GRANT FELLOWS, CASSIUS L. GLASGOW, LAWTON T. HEMANS, C. S. CUNNINGHAM, et al., Defendants.

In the above entitled cause it having been made to appear to the Court that the bond for $200,000, filed by the complainant pursuant to the order of this Court, is no longer sufficient in amount to secure the liability of the complainant in this suit if a decree adverse to it shall be rendered.

It appearing, further, that on September 30, 1915, the total amount of the receipts, certificates or agreements issued by the complainant pursuant to the order of the Court entered herein on September 26, 1911 (which receipts, certificates or agreements are hereinafter called "refund checks"), was approximately $502,192.00, and not in excess of that amount.

It appearing, further, that the complainant had, on September 30, 1915, created a fund amounting to $188,546.63, which it has set aside for the purpose of redeeming said refund checks in case it shall be compelled to make such redemption, which fund is deposited as follows:

63

In the Marquette County Savings Bank, Marquette, Mich.	$103,091.16
In the Negaunee National Bank, Negaunee, Mich.	36,649.28
In the Negaunee National Bank, Negaunee, Mich.	36,649.28

It appearing, further, that the said complainant is willing to submit said fund to the order of the Court, to be used for the redemption of said refund checks in case the complainant shall become liable to make such redemption; and,

It further appearing that said complainant is willing hereafter to deposit in such redemption fund one-third of its gross revenues received during each month hereafter for the transportation of passengers within the State of Michigan, until such time as the amount of the fund, including the amount of the bond heretofore given, shall equal the gross liability of the complainant for refund checks theretofore issued, and is willing thereafter to deposit monthly the amount of its current liability by reason of the issuing of refund checks.

Now, therefore, it is ordered, That

If and when, within twenty days from the date of this order, the complainant shall subject the fund already accumulated to the order of this Court, to secure the payment of such refund checks as the

complainant shall be adjudged liable to pay, by filing with the Clerk of this Court a receipt from each bank hereinbefore named, acknowledging that it holds, and will hold, that portion of said fund already on deposit with it, and all additions thereto, including interest accruing thereon, subject to the order of this Court in this case;

And if the complainant shall make further deposits monthly equaling one-third of its gross revenues received for the transportatoin of passengers in Michigan, as such earnings are determined in the usual course of its business, until the total on deposit
64 to secure the redemption of refund checks shall equal the gross accrued possible liability of the complainant on that account, less $200,000.00, and thereafter shall deposit each month an amount equal to its accruing liability by reason of the issuing of refund checks in that month, less any interest accrued and payable on deposits previously made;

And if the complainant shall hereafter make monthly reports to the Clerk of this Court on or before the 27th day of each month, certifying that it has complied with this order, and showing the amounts deposited in pursuance hereof during the preceding calendar month, and the several depositories thereof, which depositories shall be the banks hereinbefore named, or such other bank or banks selected by complainant as shall have agreed, in the manner and form hereinbefore described, to hold the sums deposited with it or them subject to the order of this Court; then the restraining order heretofore issued in this case shall be and continue in force until the further order of the Court.

Such funds when so deposited, including all additions thereto, shall be held, pursuant to this order, and be subject to be withdrawn only upon the proper order of this Court, and shall be charged with a trust in favor of such holders of refund checks, as shall, upon the termination of this litigation, be determined by the court to be entitled to participation therein.

It is further made a condition of this order that complainant shall make such further or other reports showing its proceedings under this order as may be required by the Court, or by the Clerk thereof, and that it shall serve on the solicitor for the defendants copies of all statements or reports that it shall make to the Court or its Clerk.

65 The undersigned Bank hereby acknowledges that there has been deposited with it by The Duluth, South Shore & Atlantic Railway Company a special fund known as the "Michigan Rate Case Fund," amounting at this date to the sum of $———; that it will hold such deposit, and all additions thereto, together with all interest accruing, in strict accordance with the terms of an order of the United States District Court for the Eastern District of Michi-

gan, Southern Division, in Equity, of which the foregoing is a copy; that it will pay the same out only when and as authorized by proper order of the said Court; and that it will make reports of the amounts on deposit in such fund whenever required to do so by said Court or the Clerk thereof.

Stipulation as to Certain Exhibits.

In the District Court of the United States, Eastern District of Michigan, Southern Division. In Equity.

DULUTH, SOUTH SHORE & ATLANTIC RAILWAY COMPANY, Complainant.

vs.

GRANT FELLOWS, CASSIUS L. GLASGOW, LAWTON T. HEMANS, C. S. CUNNINGHAM et al., Defendants.

It is hereby stipulated between the parties that, inasmuch as the originals can not be found, duplicates of the following exhibits may be marked by the Master and returned to the Court:

Complainant's:

No. 1*c*, Riggs' Allocation of Lands, 1913, as amended.
No. 49, Riggs' Apportionment of Values by Departments.
No. 50, Riggs' Modification of Exhibit No. 1, Appraisal 1911.
No. 94, I. C. C. Classification for Operating Expenses.

Defendants':

No. 43, and 43*a* to 43*h* inclusive, Printed Reports of South Shore for the years 1905 to 1913 inclusive.
No. 44, D. S. S. & A. Switching Tariff.
No. 45, C. P. R. Freight Division Sheet.
No. 83, Three Blueprints showing D. S. S. & A. rail sections, and showing wear on upper and lower sides on curves.

71 It is further stipulated and agreed, that the following exhibits need not be returned to the Court, but that the Court may call for, and that either party may produce or use, or refer to, any or all of them if and as desired, but that if either party shall produce or use, or refer to, any of said exhibits, said party shall produce the whole thereof for use by the other party if desired.

Complainant's:

No. 11, Riggs' Memorandum of Cooley Appraisal of 1900.
No. 90, Horton, Tax Commission Field Notes, Harlow Additions 1, 2 and 3, Marquette.
No. 91, Horton, Tax Commission Field Notes, Harlow Addition 5, Marquette.
No. 92, Horton, Tax Commission Field Notes, Nester Addition 1, Marquette.

Defendants':

No. 1, Report to State Board of Assessors, 1910.
No. 2, Vitali's Map of Ontonagon Valley.
No. 3, Robertson, Report of Council Committee, Marquette.
No. 9, Delf's Ore Tariffs, 1909–1913.
No. 23, Volume 5 of 1900 State Appraisals, pp. 64 to 99.
No. 41, Adam's large Land Grant Map.
No. 63, Printed Report of Mackinaw & Marquette R. R. Co., in Railroad Com. Report for 1887, pp. 77 to 88.
No. 66, Proceedings of 3rd Annual Convention of Railroad Commissioners, 1891.
No. 67, Proceedings of 4th Annual Convention of Railroad Commissioners, 1892.
No. 68, Proceedings of 5th Annual Convention of Railroad Commissioners, 1893.
No. 69, 28th Report of Association of American Railway Accounting Officers, 1913.

72 The following are exhibits of which the Record contains either a full copy, or a sufficiently full copy of the parts pertaining to this controversy, so that the originals need not be returned by the Master:

Complainant's:

No. 45*a*, sheet 2, Hire of Equipment, etc., 1910 (R. 3251).
No. 47*a*, sheet 2, Hire of Equipment, etc., 1911 (R. 3251).
No. 48*a*, sheet 2, Hire of Equipment, etc., 1912 (R. 3251).
No. 51, Diagram for earthwork estimates, Loweth (R. 2731).
No. 52, Estimated Loss (R. 3232).
No. 53, Population and Railroad Mileage (R. 3264).
No. 54, Statement of Operations, 1887–1913 inclusive (R. 3298).
No. 55, Statistics of other Michigan Railroads (R. 3312).

Defendants':

No. 3, Robertson, Report of Council Committee, Marquette (R. 2401–2405).
No. 13, Delf's Compilation of Freight-train Speed (R. 4238–4242).
No. 24, Summary Sheet of 1902 Appraisal (R. 5111).
No. 25, Summary Sheet of 1905 Appraisal (R. 5117).
No. 28, Letter on Land Values, from A. E. Miller (R. 5226–5228).
No. 46, Delf, Additions and Betterments, 1900 to 1913 (R. 7925–7933).

There are two of Complainant's exhibits numbered "90," one being a copy of a letter from Mr. Eldredge to the Interstate Commerce Commission, and the other being Tax Commission Field Notes, above referred to. The former is returned to the Court, the latter is not.

73–325 Defendants' Exhibits Nos. 66 to 70 inclusive were erroneously marked with the numbers 94 to 98 inclusive.

(Here follows report of Herbert L. Baker, Special Master, filed Feb. 1, 1917, printed as a separate volume.)

326 17.

United States District Court, Eastern District of Michigan, Southern Division. In Equity.

No. 4117.

DULUTH, SOUTH SHORE & ATLANTIC RAILWAY COMPANY, Complainant,

vs.

GRANT FELLOWS, CASSIUS L. GLASGOW, LAWTON T. HEMANS, C. S. CUNNINGHAM, et al., Defendants.

Defendants' Exceptions to the Report of the Special Master.

Now come the above named defendants, and severally and collectively take the following exceptions to the Report of the Special Master, dated January 28, 1917, filed February 1st, 1917.

Exception No. 1.

General Overruling Objections to Tentative Report.

That they except to the action, conclusions, determinations and findings of the Master in overruling and refusing in whole or in part to make the corrections and alterations in his tentative report indicated by the several objections presented on the part of the defendants to such report as submitted to counsel for the respective parties of which the final report is largely a copy, such objections being set forth in the final report of the Master on pages 417–469 inclusive, and the specific objections overruled by the Master appearing upon the face of the report and being enumerated as follows, to-wit:

327 Objections numbered 1–24, both inclusive, and 26–29, both inclusive.

That the objections to said report so set forth are hereby intended to be renewed as exceptions, and that wherever the right is therein reserved to present a specific exception to the court, such exception is herein, whether repeated or not, intended to be presented to the court as an exception to such report.

Exception No. 2.

Estoppel—Land Grant Condition.

They except to that finding and conclusion of the Master discussed and determined on pages 18-30 of such report, that as a matter of law complainant is not bound or estopped by the condi-

tions attached by law to the receipt and acceptance of land grant lands through the acceptance of land grant lands by itself or its predecessors in ownership, from questioning the validity of the Michigan passenger rate statute as found in Act 276 of the Public Acts of 1911 fixing the rates of fare to be charged upon the complainant's railroad in Michigan of two cents per mile for the carriage of passengers.

Exception No. 3.

Decree, Objection to, and Form and Findings of.

That they except to the findings and conclusions of the Master as expressed and set forth in the proposed form of decree set forth in said report on pages 407 to 409 thereof, and to the conclusion and determination therein that the rates of fare fixed by Act 276 of the Public Acts of Michigan of 1911 are, or will if enforced be, confiscatory of the property of complainant or will operate to deprive it of its property without due proces of law, and that said Act is in violation of the Constitution of the United States as applied to complainant and to the conclusion, finding and determination as expressed in said form of decree that the defendants and their successors, or any of them, should be restrained and enjoined from attempting to compel the complainant to put into force the rates in said statute fixed or from taking action or proceedings against complainant or its representatives to enforce the penalties
328 prescribed by law for a violation of the terms of said act, and to the finding and determination as expressed in said form of decree, that the defendants therein named as selected individuals representing the traveling public, be restrained from instituting proceedings against the said complainant.

Exception No. 4.

General, to Determination of Confiscation.

That they except to the entire of such report in that the said Master erred in his conclusions, determinations and findings in substance and effect that the statutory rate of fare prescribed by Act 276 of the Public Acts of Michigan of 1911 is confiscatory or insufficient or inadequate or that the enforcement of such statute will invade the constitutional rights of the complainant or will operate if enforced to deprive it of its property without due process of law, and that by reason thereof the enforcement of the rates there fixed or the operation of the statute as applied to the complainant in the operation of its intrastate passenger business ought to be restrained.

Exception No. 5.

Burden of Proof.

They object to the said report and to the conclusions and determinations and findings thereof as expressed in pages 31 to 61 thereof in overruling the contention of the defendants that as a matter of law the burden of making full and positive proof in order to overcome the validity of a rate fixing statute is upon the complainant and that it is essential that the complainant prove beyond controversy and beyond the possibility of a reasonable doubt every fact, element or thing upon which a decision of invalidity or confiscation or of insufficiency of net earnings in the regulated service is predicated.

They further except that in a number of instances throughout the report the reasonable doubt has been resolved in favor of the complainant and against the validity of the statute and the
329 rate. A few of the particulars which are pointed out as illustrative are the following:

(*a*) In making charges or in allowance for additions to property schedules for the items of contingencies at $400,000, taxes at $100,000, appreciation and solidification at $300,000 and working capital, stores and supplies at $339,918.

(*b*) In refusing to depreciate the items of ballast and track laying and surfacing in the face of testimony to the effect that those items of property do in fact depreciate and now exist and did in 1910-1913, inclusive, exist, upon complainant's railroad in a depreciated condition.

(*c*) In the acceptance of the complainant's alterations of the defendants' modified revenue train mile ratio for the division of the common property and common expenses of the complainant between passenger and freight service.

(*d*) In the determination that the decreased rates of fare now provided for by statute will not, if put into effect and that the decreased rates of 1907 did not subsequent thereto, produce increases in traffic or did not produce increases of traffic sufficient to offset in whole or in large part the decrease in revenue per passenger mile caused thereby.

(*e*) In refusing to eliminate from the operations of the complainant necessary to furnish the service required at two cents per mile the other more expensive and less profitable operations of the complainant in the carrying on of its outside operations including sleeper and diner service.

As incidental to this exception they also except to the refusal of the Master to find or to hold in substance or effect, that the character, extent or effect of the presumption of validity does not depend upon proof or inference of the legislative knowledge or upon its want of knowledge or upon its means of knowledge, or the extent of its investigations, and they insist that it is a positive presumption that the

law is valid unless all conditions which would render it invalid appear absolutely and they except to his holding, finding and setting forth of the contrary doctrine.

Exception No. 6.

Rule of Reasonable Doubt.

That they except to so much of said report as discusses, applies, adjudicates or determines the rule of "reasonable doubt" or the presumptions applicable in rate cases or the burden of proof or degree of proof required, as found on pages 31 to 61 of the report in its entirety without setting out specific language used for the
330 reason that a great multitude of separate paragraphs, sentences and clauses thereof are objectionable, and the objectionable matter is so interwoven with that which is proper as to render it inexpedient and confusing to attempt to separate and base separate exceptions upon each objectionable clause or series of clauses and as to render the entire discussion and conclusions upon the subject improper.

Exception No. 7.

Sufficiency and Character of Proof.

That the said report and its several findings are excepted to as erroneous and improper in that upon the showing made by the complainant the Master should have determined that the proofs, testimony and exhibits were insufficient to sustain or to permit a determination of confiscation in that the proofs are indefinite, that the divisions of expenses between passenger and freight services were dependent upon arbitrary assumptions and upon general opinions not represented by or shown in accounts kept for the purpose of showing the amount of expenditures incurred for the various services and were not based upon actual experience or shown to be derived from the keeping of suitable accounts, at least during typical periods which would furnish statistical information bearing upon the separation of costs to the several services. That the proof of matters of such intricacy should not be permitted to rest upon general expressions of judgment, and that the proofs do not fulfill the burden incumbent upon complainant to establish the claimed invalidating facts by definite and convincing proofs, but represent an attempt on the part of complainant after having assailed the constitutionality of the State act, to rest upon expressions of judgment when it had in its power to present accurate data which would permit the court to draw the right conclusions?

Exception No. 8.

Determination of Legal Principles.

They except to the report of the Master and to his conclu-
331 sions and determinations in deciding in favor of the complainant and against the contentions of defendants upon each of the eight distinct points of defense listed and set forth in said report, on pages 400-401 thereof, in the language following:

"This method of division proposed by defendants would, if adopted, defeat the complainants' case, and it is one of a number of distinct points of defense, any one of which if sustainable would also defeat the complainants' case. Those points of defense are eight in number and are as follows, viz.:

1. That the complainants are estopped from contesting the validity of the statute by the acceptance of land grants.

2. That the value on which complainants are entitled to a return is commercial value and that the same has not been proven.

3. That the common property and expenses must be divided between passenger and freight on the basis of time of occupancy as proposed by defendant.

4. That the sleeping and dining car service must be treated as outside operations and not a part of the service to which the prescribed rate applies.

5. That the complainants must prove every material fact beyond the possibility of a doubt.

6. That the presumption in favor of the statute although disputable in theory is indisputable in fact.

7. That the complainants must prove by affirmative evidence that the loss from decreased rates will not be overcome by increased traffic.

8. That complainants must prove what percent of return they are entitled to; that they have failed to make such proof, and are therefore not entitled to the relief prayed for.

If any one of these points of defense is sustainable the complainants' case must fail."

Exception No. 9.

Rate of Return.

They except to such report in its entirety and to the several determinations and findings thereof which resulted in the conclusion that the rate of return to complainant to be expected upon the value of the property employed by it in its Michigan intrastate passenger business under the rates prescribed in said Act 276 of the Public Acts of 1911, is or would be but 2.24%, and that such rate of return upon such property amounts to a deprivation of complainant's property rights in violation of the Fourteenth Amendment of the Federal Constitution, and they except to all findings and determinations upon which is based any conclusion that a less rate of return than 8% on

such property is shown with such statute in operation, and they specifically except to the conclusion, and to the several findings upon which it is based, stated on page 391 of such report as follows:

332 "I have found (1) the entire value of complainant's property to be $13,901,938; (2) the value of the property employed in the complainant's Michigan intrastate passenger service to be $2,741,872; (3) the rate of return to be expected thereon under the prescribed rate to be 2.24 per cent, and (4) the rate of return to which the complainants are entitled under the constitution to be 6.5 per cent."

Exception No. 10.

Rate of Return.

They except to the conclusions, determinations and findings of the Master upon the subject of the rate of return to which complainant is entitled on its whole property in Michigan engaged in serving the public as well as upon that part of its property engaged in performing its intrastate passenger operations in Michigan, as embraced in pages 377 to 390 of the report, and also except specifically to the finding, on page 389 thereof and repeated on page 391, that the minimum rate of return to which complainant is entitled under the constitutional guaranty of the Fourteenth Amendment is 6.5 per cent, and specifically except to the several incidental or corollary conclusions and findings upon which the same is based as follows:

(*a*) That the complainant is entitled to a greater return than the current rate of interest at 5% upon money loaned without specific contract arrangements.

(*b*) That there is any testimony or evidence in the case or that the Master may take judicial notice of practices and customs or the experience of the community, of such a character or in such a manner as to predicate thereon a determination that complainant is entitled to a fixed or minimum rate of return of 6.5% or that a rate of return of more than the current rate of interest is expected by investors generally, on investments of similar hazard in the community in which complainant's railway lies.

(*c*) That, as stated on page 386 of the report, the rate of interest provided by statute where no rate is stipulated has no relation whatever to the question of what would be a proper rate of return from a given property investment or from the investment in complainant's property on the case presented to the Master on the record in this cause.

333 (*d*) That the complainant is entitled to a greater rate of return than is paid as interest on its bonded indebtedness, which is greater than the value of its property.

(*e*) That capital could not be induced to reproduce and operate this property by a prospective return of less than 8 per cent.

(*f*) That he resolves doubts in favor of defendants in finding the minimum rate of return to which complainant is entitled by taking a

point half way between the interest rate on money without contract and such 8 per cent.

(*g*) That where the statutory regulation is of a part of the business only, the complainant is entitled to a full return upon the property engaged in the regulated part of the business as against a claim of confiscation and to the same rate of return to which it would be entitled, if its whole rate schedule on all branches of its business were in litigation.

Exception No. 11.

Rate of Return.

That they except to so much of said report, found on pages 394 et seq., as discusses the relative rates of return from passenger and freight services and to the determinations and findings based thereon, and particularly to such part thereof as bears upon or supports the inference that a passenger rate, sufficient in itself to support the property engaged in carrying under it, can be affected or made insufficient by being combined with freight rates which are insufficient, and they insist that it is incumbent upon a complainant before it can be entitled to relief on the ground of confiscation, to show confiscation in fact through the denial of sufficient earnings from the regulated service at the rates being questioned, to support the fair proportion of the property actually devoted to that service.

Exception No. 12.

Values in General.

They except to the discussions and determinations in such report, upon page- 65 to 87 thereof, upon the questions of "value" and "value proper for use in rate cases" for the reason that the
334 same is predicated upon erroneous premises, is supported by untenable arguments, is based upon faulty reasoning and does not properly lay down the rules applicable in rate cases. This exception is made to the entire discussion, for the reason that to except to each erroneous passage thereof would make these exceptions unduly prolix and confusing.

Exception No. 13.

Values, Cost of Reproduction.

They except to said report as being erroneous in its several findings and conclusions and particularly as discussed and set forth on pages 62 to 87 thereof, that as a matter of law the "cost of reproduction value," less depreciation, or "the replacement cost value" is to be taken as the absolute measure of the value which must be sustained by the rates permitted by law to be charged, and except to the findings that inasmuch as the rates fixed do not pay what the Master finds to

be a fair rate of return upon the value thus arrived at, the rate fixed is unremunerative or confiscatory.

Exception No. 14.

Values, Commercial, as Limiting.

They except to such report and to its findings and conclusion as matters of law and fact as expressed between pages 62 to 87 thereof, that the cost of reproduction value of the property upon which complainant is entitled to a return can, or does exceed its commercial value or can or does exceed the consideration at which the public could acquire the full title to such property through exercise of its power of eminent domain.

Exception No. 15.

Values, Intrastate Passenger, Too High.

They except to the finding and conclusion, as expressed on page 391 of such report and at other places and exhibits therein, that the value of the entire of complainant's property devoted to its intrastate
335 passenger business in Michigan is as much as $2,741,872, or that it is greater than the $1,547,888 shown by defendants' claimed value, or that the value of complainant's property devoted to its entire freight business, or to its interstate or intrastate freight business, or to its interstate passenger business, is so small in proportion to the amount devoted to its intrastate passenger business, as he finds it to be; otherwise stated, the exception is that too large a proportion of property is found to be devoted to intrastate passenger business and too small a proportion to other classes of business.

Exception No. 16.

Values—Specific Criticisms.

They except to such report, and its several findings and conclusions appearing on pages 62 to 242 thereof, in that the value of complainant's property engaged in and devoted to, its business in serving the public in Michigan as adopted by the Master at $13,901,938, is excessive, is greater than its actual value and is greater than the cost to replace or reproduce the same, less depreciation, and is greater than the, or any, value thereof, that complainant is entitled to support by Michigan statutory rates of charge, and is greater than the, or any, value thereof, that the public is required to support; that such excessive, erroneous and inflated value is due to the considerations mentioned in the other exceptions herewith made, and to the following:

(*a*) In arriving at, and in fixing the values fixed and listed for the various descriptions of real estate and right of way, the Master includes improper values, and improper elements of value and proceeds upon erroneous theories of value, in that, to-wit:

(1) On pages 88 to 90 and 114 of the report, strategic or special values are improperly attributed to and included for, certain lands on account of their claimed adaptation for railroad purposes.

(2) On pages 91 to 95 and 115 of the report riparian and other water rights not in actual railroad use, are improperly allowed
336 as being appurtenant to lands of complainant at St. Ignace, Marquette and Houghton.

(3) On pages 95 to 99 of the report, certain trackage rights existing in streets in the cities of Marquette and Ishpeming *and* erroneously included.

(4) On pages 99 to 107 and 115 of the report, mineral and ore values in and under the right of way, and speculative values due to the possibility of discovery of minerals under the right of way are improperly allowed.

(5) On pages 107 to 118 and 115 of the report, land values generally are taken, and are in the findings used, which are excessive and contrary to the weight of evidence.

(6) Pages 107 to 118 of the report show improper reliance upon testimony of witnesses placing high values, and a refusal to take the testimony of witnesses equally entitled to credit and equally well qualified to fix values, whose values were well considered, and who fixed lower values and the refusal to apply proves tests of the corectness or incorrectness of opinion evidence of value, which tests show the values used by the Master to be excessive.

(7) The refusal to take into account, or be influenced by, values fixed by actual purchase and sale of similar, nearby and adjacent lands.

(8) On pages 124 et seq., the allowance of additions to values for clearing and grubbing, which operates to bring the values of complainant's lands above the values of similar nearby and adjacent cleared lands.

(*b*) In arriving at and fixing such values for real estate and right of way, the Master proceeds upon erroneous and improper methods of valuation, in that, to-wit:

(1) Lands in considerable or large tracts are considered and valued upon the basis of adjacent or nearby lands subdivided into small lots, and upon the basis of present demand for and immediate sale of the whole of such lands at prices which were paid for a small number of lots out of a larger number in the vicinity.

(2) The assumption is given effect, that there would be immediate demand, at high prices, for all the South Shore lands now occupied by the railroad.

(3) The detrimental effect of the railroad, as giving a lower value to lands in its immediate vicinity for other than railroad pur-
337 poses, was not taken into account, in that the railroad lands were considered of the same value as, and favorably compared with, residence and high-class business property located in better parts of the municipalities where those lands lay.

(4) Principal and main streets in municipalities were assumed to be projected through and on to the lands of complainant, and it was assumed that there would be immediate demand for all railroad

lands thus assumed to be on such streets, for the same uses as occupied lands now on such streets or in the vicinity are now devoted to.

(5) Values which are based upon purchases for railway purposes are accepted, resulting in the inclusion of the value, and elements of value, for railway purposes forbidden under the Minnesota Rate Cases.

(c) In valuing the property of complainant, the Master places high and excessive values, in that:

(1) He found the total value of the lands of the complainant in Michigan to be $1,780,239, whereas the true value, and the value proper for use in a rate case, was, and is, much less, excessive values being placed upon the lands in each of the counties of Chippewa, Mackinaw, Schoolcraft, Marquette, Baraga, Houghton, Ontonagon and Gogebic.

(2) On pages 95 to 99, he valued trackage rights in streets (erroneously included) at much in excess of cost to produce, or to reproduce, and in excess of any value therein belonging to complainant.

(3) On pages 118 to 124, he assumed that to reproduce the earth grading upon complainant's line would cost thirty cents a cubic yard, whereas, the true cost to reproduce, and the real reproduction value and the value proper for use in this proceeding does not exceed an average of twenty-five cents a yard.

(4) On pages 134 to 136, he finds a unit price for ties of thirty-nine cents each, notwithstanding the records and reports of complainant to public boards in Michigan show tie prices to be considerably less, and notwithstanding the actual purchase price and value of ties is and has for several years been less.

338 (5) Notwithstanding the weight of the evidence shows that ballast does depreciate and that it must be renewed and replaced from time to time, to keep it in 100 per cent condition, and that it now exists on complainant's railroad in a depreciated condition, he, on pages 138 to 145, refuses to allow for its depreciation, and erroneously finds and determines that there is no depreciation in it.

(6) On pages 145 to 157, he adopts as the price or value, or cost of reproduction, of "Tracklaying and surfacing" $600 a mile, whereas, its real value or reproduction cost is not shown by the preponderance of evidence to exceed $526 a mile on complainant's railroad.

(7) He refuses to depreciate "Tracklaying and surfacing" though the same does depreciate and now exists and did in 1913 exist, in complainant's railroad in a depreciated condition, and though the track structure, made up of ties, rails, frogs, switches and crossings, track fastenings, and track laying and surfacing as a whole does depreciate, and is now and was in 1913, in a depreciated condition, and the track laying and surfacing, as a whole does depreciate and was and is in fact depreciated in like proportion as do and are the other items of the track structure.

(8) On pages 180 to 182, the value is improperly increased and enlarged by allowance for and addition to property values of, a con-

structive percentage of two per cent as "Engineering on Equipment."

(9) On pages 147 to 203 he adds on account of "Contingencies," $400,000, without sufficient proof that contingencies in that, or in any account, existed in the property or would inevitably occur in a reconstruction, or were incurred or paid for in construction of the property and against the contention that such item is not proper for allowance in rate cases.

(10) On page 204, he allowed and included in the value of complainant's property, on account of "Legal Expenses during Construction," $51,400, notwithstanding the weight of evidence indicates that the allowance therefor should not exceed $25,000.

(11) The amount allowed on pages 207 to 219, as "Interest during Construction" is more than any proportion of the value of complainant's road attributable thereto, is greater than any amount shown to have been expended thereof by complainant out of capital, and is greater than any amount which would be expended in the event of reproduction.

(12) The allowance, on pages 203 to 218, of $100,000, on account of "Taxes during Construction," is improper, as there is no
339 proof that taxes would be paid, or of the amount that would be paid, in case of reconstruction, or what was actually paid during construction, and during the period of construction of complainant's railroad, taxes were imposed upon gross earnings of railroads, the property being exempt.

(13) The allowances and additions, on pages 219 to 224, on account of "Working Capital" and "Stores and Supplies" are excessive, in that the amount allowed for stores and supplies is ample for both items.

(14) The amounts allowed for depreciation upon various of the elements or items of property are insufficient.

(15) The amount of $300,000 added to the appraisal on pages 224 to 234, on account of "Appreciation" is not sustained by the evidence and the existence of any appreciation in the roadbed of complainant, which would increase its condition above the 100 per cent inventoried and included in the appraisal, is not proven, and there is no proof from which it is possible to find that appreciation of $300,000, or any other amount, exists in complainant's railroad. Nothing was included in complainant's inventory for appreciation, and no notice or intimation was given of a purpose to claim or add for it, until the argument.

(16) The allowance, or addition to the property, of items listed in schedule No. 39, pages 206-7 of the report, under "Organization, administration and general expenses during construction" is improper.

(17) The exceptions to the value of the property and the particulars stated are not intended to exclude other exceptions which are comprehended in the general exception to the fixing of the value of the Michigan property at $13,901,938, and the right is reserved to specify objections to every item of property entering into the final value.

Exception No. 17.

Values—Contingencies.

That they except to so much of said report, appearing on pages 194-195 and 203, as is hereinafter set out, as follows:

"From the foregoing evidence, I find that in the reproduction of complainant's property, there are costs which are certain to be incurred for certain purposes which can be foreseen, and the amount of which can be estimated with reasonable certainty; that according to universal experience, the total cost of reproducing the property will exceed the total of the costs, thus foreseen and estimated
340 by reason of additional costs arising from mistakes and unforeseeable happenings, that these additional costs are by their very nature such that their amount cannot be foreseen or estimated in the manner and with the degree of certainty that the foreseeable costs can be estimated, but that they can be estimated on the basis of general experience and the law of averages; that according to such experience these additional unforeseeable costs usually amount to, on the average from ten to fifteen per cent of the total of the estimated costs of Schedules 3 to 28 inclusive, that, according to the weight of evidence in this case, the amount of such unforeseeable costs to be estimated on the reproduction of complainant's property would be ten per cent of the total of the estimated costs of Schedules 3 to 28 inclusive, amounting to the sum of $782,306; that although an allowance of this amount would be supported by the weight of evidence I do not make such allowance, but in view of the uncertainty pertaining to the subject, and on the principle of resolving all doubt in favor of the defendant, I have decided to allow for contingencies the sum of $400,000, the same being little more than one half of the amount last named and more than $79,000 less than the amount allowed for contingencies by the defendants' expert, Mr. Hansel." (Pp. 194-195.)

"From all the evidence in the case, I am convinced beyond a reasonable doubt, not that the $400,000 which I have allowed for contingencies is the exact amount of the additional costs that would be incurred in the reproduction of complainant's railroad resulting from contingencies, but that that amount is a fair and conservative estimate of the minimum of such additional costs, arising from contingencies not taken into account in the other estimates." (P. 203.)

Exception No. 18.

Values—Appreciation.

That they except to the entire discussion, conclusions and findings of the Master upon the subject of appreciation, as comprehended in the report on pages 225 to 234 inclusive, and particularly to so much of said report as finds there is proof of the amount of appreciation existing upon complainant's property, or that the fact or the

existence of appreciation is proved by contradicted evidence, or that appreciation of the character described and allowed for, is proper for addition in a rate case, or that the proof upon or the question of law or fact involved, in any of those assumptions, appears in this case beyond possibility of reasonable doubt.

341 Exception No. 19.

Values, Created by Operating Expenses, Deduction of.

They except to such report and to its conclusions and findings as erroneous, in that it finds the value of the property of complainant and of the portion thereof attributed to, and which is required to be supported by, the Michigan passenger business, to exist in too great an amount and value, due to the failure to make deduction therefrom for that part thereof created or paid for out of operating expenses, and on page 241 et seq. thereof, the Master refuses to make such deduction; that the amounts of property created out of operating expenses are indicated by the testimony to be large, that it was incumbent upon complainant to show the amounts thereof, in order that they might be deducted from the value and that in the absence of such proof, no finding of a value of complainant's property which should be supported by rates was possible.

Exception No. 20.

Values, Contributed by Public, Deduction of.

They except to such report on the ground that its conclusions and findings are erroneous in failing to find, and deduct from the value of complainant's property to be supported by rates, as claimed by defendants, the value of property included in the inventory, which was contributed to complainant by the public for railroad use, and in determining on page 239 thereof, that property so contributed or obtained is properly added to the inventory and made a part of the value to be sustained by statutory rates.

Exception No. 21.

Values, Division of Common Between Passenger and Freight.

They except to the division between services of property used commonly in passenger and freight services, as made in such report on pages 245, et seq. thereof, as erroneous in the particulars, severally and collectively, as follows:

(*a*) That neither the basis of the time of use by the respective services, as proposed by defendants, nor the alternative basis,
342 using the modified revenue train-mile ratio, as computed by defendants, was used.

(*b*) That the amended modified revenue train-mile ratio, as adopted, is erroneous, as it attributes to passenger business a greater

amount, volume and value of property, and to the freight business a lesser amount, volume and value of property, than is used by them respectively. The errors therein are in each of the particulars, and the exception is for the reasons severally and collectively, that:

(1) It does not give effect to the time, value or amount of use by the respective services.

(2) In the elimination from the percentage as is done on pages 256 to 267 of the report, of the time of freight trains engaged in stational service of the part of their time spent on exclusive freight tracks, too large an amount of time is deducted, due to the use of too great a mileage of exclusive freight track, and of too small a mileage of common track, and due to the assumption that the volume of use or stational time per track mile, is the same for both common and exclusive tracks.

(3) In dividing as described on pages 256 to 267 of said report, that statistical switching mileage of complainant between passenger and freight business for addition to the train mileage to reach the modified train-mile ratio, too great an amount of switching mileage is attributed to exclusive tracks and too small an amount to common tracks.

(4) In arriving at the modified revenue train-mile ratio which the Master uses, the applicable presumptions of law are reversed by him, and, instead of resolving the doubts which existed in favor of validity of the statute and rate, he resolved doubtful questions against the sufficiency of the rates.

(5) The division made of common property between passenger and freight services, is dependent solely upon opinion, without adequate supporting data.

(6) The deductions and recomputations by which complainant alters defendants' modified revenue train-mile ratio, which deductions and recomputations are accepted by the Master as described on pages 256 to 267 of the report, depend largely on the assumption of unproven conditions, on which there is no testimony; the assumptions without evidence being:

That stational service occurs in equal volume on exclusive and on common tracks.

343 That the statistical switching mileage is made on exclusive tracks in the same relative proportion per track-mile as it is made on common tracks.

(7) Certain mileage of exclusive ore trackage upon which no stational time is spent or stational mileage made, and upon which none of the time of freight trains comprising the 39.01 per cent of stational time is spent, is used in setting off stational time to exclusive freight trackage, whereas in fact it should not be used because no stational time is included for it. The detail of such mileage is as follows:

American Mine Branch	2.96 miles
Republic Mine Branches	1.48 miles
Champion Branch	.97 miles
Imperial Mine Branch	2.80 miles
Beaufort Mine Branch	1.10 miles

(8) Certain exclusive freight track not operated in 1912 or 1913, and some abandoned exclusive freight track, is included for the purpose of drawing to it, and away from the common trackage, a portion of the stational time, for the purpose of reducing the freight side of the modified revenue train-mile ratio. As such mileage was not in existence or was not used, it results that no stational time could have been spent on it, and, therefore, it is not to be used in reducing expenses due to stational time upon it, as exclusive freight trackage. The detail of such mileage is as follows:

Hunter's Branch	4.82 miles
Danaher and Northern Cooperage Branches	8.38 miles
Old Negaunee Mine Branch	.96 miles

Exception No. 22.

Report Based on Operations of a Single Year.

The defendants except to the refusal of the Master, as shown on record pages 10716-10718, and mentioned on report pages 363 to 366, to permit the introduction of, or to consider, the report showing complainant's passenger and other earnings for the fiscal year 1914, and except to such report in its entirety as not including any findings, determinations, values, expenses, earnings and net revenues as relating to operations since June 30, 1913.

344 Exception No. 23.

Unearned Increment as Income.

They except to the conclusion and finding as expressed on page 323, et seq. of said report and given effect therein, that the unearned increment in lands and other property, due to increase in values which complainant has been permitted to include in the value of its property and held to be entitled to a return upon, is not an income and is not to be considered in determining the sufficiency of the rate of return as against the claim of confiscation.

Exception No. 24.

Revenues—Mackinaw Transportation Company.

They except to said report, and to its conclusions and findings, on pages 173 et seq. in that the amount of earnings set apart and used as the net passenger revenue to support the property used in complainant's passenger business is deficient in that, none of the revenues from passengers carried in complainant's cars over the Mackinaw Transportation Company's carferries, are included, and that the reasons for such exclusion as expressed on such pages thereof are insufficient.

Exception No. 25.

Revenues—Sleepers and Diners.

They except to the assumption in said report and to the incident findings based thereon, on page 405*d*, that the revenues from the operation of sleeping cars are allocated between states and insist that the proportioning of the revenues from the operation of sleeping cars, between states is on an arbitrary basis, the nature of which was not disclosed, and that the revenues from this source should be divided on the basis of direct revenues from the carriage of passengers which would attribute to Michigan $34,364.40 instead of the $30,243.11 of revenue which was considered by the Master as the Michigan proportion of the revenue from sleeping cars.

345 Exception No. 26.

Revenues—Mail Service.

They except to such report and to the findings and conclusions thereof, in fact in the division of the revenue from the service of carrying the mails, too small an amount of the unallocatable revenue therefrom is assigned to intra-state business, and too large a proportion is assigned to interstate business.

Exceptions 25 and 26 are only applicable in case outside operations are declared to be an integral part of the passenger business in determining the sufficiency of the statutory rate.

Exception No. 27.

Operating Expenses—Those for Single Year Used.

The defendants present an exception that such report on pages 282 et seq. is erroneous in its findings and determination, that the operating expenses for the four years, 1910-1913, are not taken and used for testing the validity of the statute, instead of those of 1913 and that those for the later years 1914 and 1915 were not required or permitted to be introduced.

Exception No. 28.

Operating Expenses—Those for Single Year Used.

That they except to said report in that its findings are permitted to stand and are based upon, the accounts, value of property, earnings, and expenses for a single year, whereas there were before the Master accounts and values for at least four years, and there were also available the accounts for other and later years.

Exception No. 29.

Operating Expenses—Elimination of Sleepers and Diners

They except that said report, and its conclusions and findings as set forth on pages 284 to 308*b* thereof, are erroneous, as the expenses of operation of sleepers and diners are not eliminated from
346 the operations of carrying passengers at two cents per mile, and there is not eliminated, as part of the expenses of such outside operations, not only the added (or "out of pocket") costs by reason of doing such business, but also a proper proportion of all costs attributable thereto.

Exception No. 30.

Operating Expenses—Sleepers and Diners.

That they except to the entire discussion, conclusions and findings upon the subject of sleeping and dining cars and outside operations as set forth in said report, on pages 285 to 308 B, inclusive, and to the several computations, exhibits and tabulations through and by which the erroneous principles there laid down, (namely, that the outside operations including sleeper and dining services, are an integral part of the business of carrying passengers at the rate of two cents per mile, and that therefore the expenses of such sleeper and diner service are to be considered as part of complainant's passenger expense in determining the sufficiency of the regulated rates), are arrived at or carried into effect.

Exception No. 31.

Operating Expenses—Still Abnormal.

The defendants except to said report, in that the amounts on pages 278-280 thereof, deducted from the operating expenses of 1913, to eliminate abnormal expenditures, expenditures for additions and betterments, and expenditures for deferred maintenance, so as to reduce the expenses of that year to a normal amount, are insufficient, and that, after the elimination of the amounts deducted, the expenses used for 1913, are still abnormally high and still include expenditures to make good the depreciation of other years and for additions and betterments.

347 Exception No. 32.

Operating Expenses—Annual Depreciation.

The defendants except to so much of said report, found on pages 272-275 thereof, as apparently determine- a public utility, whose

property is kept on a fixed or rising level or percentage of physical condition from year to year, out of operating expenses, to be entitled to reduce the net income by a charge for an annual depreciation or a theoretical depreciation of the current year, particularly in view of the evidence which shows the condition of complainant's railroad, in 1912 and1913, was improved out of operating expenses, and that charges for depreciation of equipment and docks had already been made to operating expenses.

Exception No. 33.

Operating Expenses—Depreciation.

That they except to the language used and finding set forth in said report on page 277 thereof, as follows:

"Complainant further asks me to find, in this connection, and I do find, that it is the rule of law that — public service corporation must be allowed sufficient revenue to pay its operating expenses, to keep up its property and to pay a fair return on the investment; that in accordance with this rule, such a corporation is entitled to and should charge off each year, in addition to its operating expenses, a sufficient sum to take care of the annual depreciation of its property; that the testimony shows that complainant has not, in its accounts, charged depreciation on any of its property except equipment and ore docks; and that to represent a true statement of the financial results of complainant's operations, there should be added to the operating expenses of each year, as shown by the company's books, an additional amount to take care of the depreciation on the remainder of the property on which no depreciation has been charged."

Exception No. 34.

Operating Expenses—Adjustment to Normalize.

They except that said report is erroneous in the statement and conclusion, on page 278, that:

348 "If the tie prices paid in 1913 had been in effect in the three preceding years and if in each of the four years a proper charge had been made for annual depreciation on the bridges, trestles and culverts on complainant's road in Michigan, to say nothing of depreciation on buildings and other property, which depreciation I have not attempted to compute, the average Michigan operating expenses of those years would have been increased by $70,159; the average Michigan passenger operating expenses would have been increased by $21,769; and the average Michigan intrastate passenger expenses would have been increased and therefore the average Michigan intrastate passenger net income reduced by $13,346.

Exception No. 35.

Operating Expenses—Separation to Exclusive Freight Tracks.

That they except to the method followed by the Master, on pages 367-376 of the report in setting off to exclusive freight service the expenses of maintenance and operation of exclusive freight tracks in that:

(*a*) An insufficient amount is set off to such exclusive freight tracks.

(*b*) That the $300 per mile used for industrial spurs and the $375 per mile used for nine branches is insufficient to represent the real cost of maintenance of such tracks.

(*c*) That the division of the expenses of maintenance of side track mileage upon a 3 to 1 equation sets off to freight an insufficient amount of expenses in that the testimony shows the ratio of equation to be 2 to 1.

(*d*) That certain of the exclusive freight tracks, namely, 4.23 miles Negaunee to Winthrop is treated as common, though it is in fact exclusive freight mileage.

(*e*) That certain of the items of expense occuring upon exclusive tracks are not set off to it. The expenses referred to being described in the Master's report on pages 331-3.

Exception No. 36.

Operating Expenses—Division of Account 91 Between Services.

Exception is taken, to so much of said report as set forth
349 on page 340 et seq., as divides account number 91, "Crossing Flagmen and Gatemen," on the basis used, made up of a combination of the revenue train mile and switching ratios, or on any ratio less favorable to the passenger service, than the ratio of switching in passenger and freights.

Exception No. 37.

Operating Expenses—Common—Division Between Services.

They except to the conclusion and finding, as expressed in said report on pages 245 to 267 thereof, that common expenses not otherwise divided between or allocated to passenger and freight services are properly to be divided, and to the Master's practice in dividing the same, on the basis of the modified revenue train-mile ratio as computed by complainant or as adopted by the Master, for the reasons, severally and collectively, that:

(*a*) The method used disregards the actual volume and time of use, which are the proper factors for dividing that part of those expenses incident or due to weather and time, and not to train move-

ment; it also disregards and gives no effect to the gross ton-mile ratio, which is to be considered in dividing those expenses which are due to train movement, and which are the result of wear and of the use of the tracks and road bed by trains.

(*b*) The method used passes over, and the Master refused to apply, a basis which is as favorable to the validity of the rate as is the defendants' modified revenue train-mile ratio, which ratio more nearly approximates correct results than does complainant's modified revenue train-mile ratio, though even the defendants' modified revenue train-mile ratio reaches results too favorable to complainant.

(*c*) The method used divides expenses due to time and weather upon a basis having no proper relation to their causes.

(*d*) In the computation of the modified revenue train-mile as adopted and applied by the Master, the several imperfections, which are hereinbefore described and set forth in Exception No. 21 appear and are herein, so far as applicable, repeated as applying to the division of common expenses.

350 Exception No. 38.

Operating Expenses—Revenue Train Mile, Division of.

That they except to so much of said report as is found on page 251 thereof as follows:

"My conclusion is that the extent of the use made by each service of the common property in the operation of revenue trains is to be measured by the distance moved by the trains and not by the time consumed in making this movement; that the unit of use is therefore, a distance unit; and that the property is to be divided on the basis of the number of miles traveled by the trains in each service respectively."

and to all discussion, findings and determinations upon which the conclusion stated is based.

Exception No. 39.

Loss of Freight Engine Power Due to Passenger Service.

Exception is taken, to so much of said report as expressed on page 334, et seq., and 335, et seq., thereof, as finds that there is proof of loss of power in the freight engines due to any super-elevation of curves for passenger service, or as finds that any amount can be fixed for the cost thereof measured by use of fuel, or in any other manner or as assumes or finds any super-elevation of rail to exist, or to have existed on the D. S. S. & A.

Exception No. 40.

Excessive Maintenance for Passenger Service.

Exception is taken, to so much of said report as expressed on pages 334 and 337 thereof, as finds the evidence to show that complainant's line is better maintained because of the passenger service thereon, than it would be or then necessary if it was maintained for the freight service of complainant's line only, or that the net results from freight service would be greater if the line were maintained at a lesser cost.

351

Exception No. 41.

Freight Expenses Caused by Passenger Service.

They except to the portion of said report found on pages 337 and 338 et seq., which carries the inference that expenses are or were in 1912 or 1913, on the D. S. S. & A. charged to freight service, which would more properly be charged to passenger service or which are or were caused by or for passenger service, or that the amount- of any such expenditures or costs are determinable or are properly determined in the amounts there fixed or set forth.

Exception No. 42.

Operating Expenses—Division Between Inter and Intra State Passenger.

Exception is taken to the division of common Michigan passenger expenses between intrastate and interstate services on the ratio of the number of passengers carried one mile, as described in said report on pages 334 to 348 thereof, and carried into effect in the exhibits, as the cost per passenger per mile is so affected by density and volume of traffic that, due to the greater number of passenger miles in intrastate, as compared with interstate business, the cost per passenger per mile is and was of necessity less in intrastate than in interstate service.

Exception No. 43.

Operating Expenses at Stations, Division Between Intra and Inter State Passenger.

Exception is taken to the division, between intrastate and interstate passenger business, of the accounts No. 63—"Station Employees" and No. 66—"Station Supplies and Expenses" on the relative number of intrastate and interstate passengers, as described in said report on pages 348 et seq., thereof, and carried into effect in the exhibits, as such division should be on a ratio not more unfavorable

to intrastate passenger business than the ratio of the number of passengers carried one mile in each service.

352 Exception No. 44.

Loss Due to Reduced Rates.

Exception is taken to the determinations and findings, and to the reasons expressed therefor on pages 250 et seq. of the report upon which the Master bases and allows an estimated loss due to, and claimed to be, the necessary result of putting into effect the rate of two cents per passenger per mile, the allowed loss being equal to the difference between the earnings under the rates now and heretofore in force, and the earnings on a flat rate of two cents per passenger per mile applied to the identical amount of business done in the years considered on the assumption that the probable earnings under the two cent rate would be that amount less than under the previous rate, for the reasons severally and collectively, that:

(*a*) There is no proof and no presumption that there will be any loss.

(*b*) There is no basis for a conclusion that increased traffic sufficient to recoup or equalize any loss in revenue per passenger mile due to the decreased rate, will not result therefrom.

(*c*) Said rate never having been put into operation on complainant's line, there is no experience and no basis on which to estimate or to find any loss due to putting it into affect.

(*d*) There is no testimony or evidence that the decreased rate will not so increase the volume of traffic that there will be no loss of revenue.

(*e*) The presumption or the rule of experience that increased traffic produced by the decreased rate will be sufficient to overcome, in whole or in part, the loss in revenue per passenger per mile due to the decreased rates, has not been overcome.

(*f*) The conclusion, as set forth on pages 354 et seq. and 358 et seq. of said report, that the reduction of the passenger rate in 1907 from four to three cents, did not result in increased traffic is unsupported by the evidence being that increased business did result from such reduction.

353 Exception No. 45.

Loss—Probable Earnings under Reduced Rate.

They except to the entire of the Master's discussion in such report, on pages 350 et seq., and to all findings and determinations based thereon, on the subject of the "probable earnings under the two cent rate" and insist that no reduction for a possible decrease in net revenue is permissible until after a test of experience furnished by putting the rates into effect after a reasonable time, and they except that there is no proof to sustain the Master's conclusions, findings or deductions on that subject.

Exception No. 46.

Values and Operating Expenses, Division Between Inter and Intra State Freight.

The defendants except to the said report in its determinations and findings, as declared on pages 366 et seq., thereof, as to the amounts of property, revenue and expenses attributable to complainant's freight business, and to the intrastate proportion thereof, as improper for the reasons, severally and collectively, that:

(*a*) An insufficient proportion of property and expenses is assigned to freight business, with the result that passenger business is thereby unduly burdened.

(*b*) In the division of the property, and expenses allocated and assigned to the freight business, between intrastate and interstate freight services, an excess proportion is assigned to intrastate business.

(*c*) In the division of property and expenses between the intrastate and interstate freight business, the allowance of a greater amount of stational expense as attributable to intrastate business than is attributed to interstate business is improper and is founded on improper and insufficient evidence.

Exception No. 47.

Operating Expenses—Greater Stational Costs for Intrastate Freight.

They except to so much of the Master's report, found on
354 pages 369 et seq. and to the findings and determinations based thereon, as is to the effect that there is a proven greater cost for stational service for intrastate than for interstate freight, and insist that the Master has disregarded the proofs in this respect, and they particularly except to the passages of the report thereon as hereinafter set forth.

"But the complainant claims that even if the haulage cost in the two services is the same per ton mile, nevertheless terminal and stational expenses cannot be properly divided on the relation of the freight ton miles made in the intra and inter state services, respectively, but should be divided in proportion to the tons handled in the stations and terminals.

"It seems to me that in this contention complainant is correct. The cost of assembling and delivering freight in stations and terminals has no relation to the miles over which such freight is carried." (Pp. 369-370.)

"The total of these stational and terminal expenses thus determined aggregated in 1912 $405,335, and in 1913 $469,405." (P. 371.)

"It was shown by the undisputed testimony that the stational or terminal service performed in interchanging car-load freight with other carriers at junctions is much less per car than that performed in originating or delivering it at stations on the line of the road, and that

on the average it was not more than one-fourth of the latter." (P. 372.)

"It is claimed by the defendants that the testimony upon which I base my findings as to the average stational service given a ton of freight in the interchange thereof with another railroad consists entirely of opinion testimony, and that opinion testimony does not furnish a sufficient basis for such a finding.

"The finding, however, is based only in part on opinion testimony as hereinafter explained, and such opinion testimony was not of the same character as that which was criticised in the Minnesota Rate Cases. The opinion evidence on this point in this case was from employees of the complainant thoroughly familiar with its method of interchanging freight, and of the amount of service required therein. It was shown further, undisputed in the case, that in general such interchange was made in loaded cars placed on delivery tracks conveniently arranged so that little expense was involved in either putting the car on to the exchange track or taking it therefrom.

"It was further shown that the complainant, in receiving freight at stations on its line, is compelled in general, first, to spot cars to be loaded, often at industries considerably distant from its main line, then, when the cars are loaded, haul the cars to its main line; and that in delivering freight, the service is the same with the process reversed.

355 "It was further shown in the evidence that at junction points usually several cars at a time, amounting at some junctions to more than 500 cars a week, are interchanged, whereas in the delivery or receipt of freight at stations on the line, the deliveries are in fewer car lots, there being over 200 stations on the road in Michigan where freight is originated and delivered as against only twelve junction points where freight is interchanged. The fact that the interchange business involves less stational service than is involved in originating and delivering freight at stations is proved by undisputed evidence; the amount of this excess is shown only by opinion evidence. From this opinion evidence I find that the relative service on this interchange business does not exceed one-fourth of the service that is performed in originating or delivering freight at stations on the line of the road. The results of this division are as above shown." (Pp. 374-375.)

They further except that the failure to set off and separate from the other business the shorthaul ore business, and its stational service, entirely destroys the value of the Master's separation of costs between inter and intra state freight business, and that if such service were included the cost of interstate freight service on complainant's line, as compared with the cost of the intrastate freight service, would be several times as much per unit.

Exception No. 48.

General, Rates of Return and Property.

The defendants except to the said report and to its determinations and findings as a whole, as erroneous and contrary to the evidence, as:

(*a*) The net revenue shown therein to be earned by and attributed to, the intrastate passenger business for each of the several years embraced in the report, are less than under all the evidence they should have been found to be.

(*b*) The amounts of property and expenses attributed, assigned or allocated to the intrastate passenger business for each year comprehended in said report, are greater than under all the evidence, they should have been found to be.

356 In Conclusion.

The several heads or sub-divisions of each separate exception are intended to operate both cumulatively and separately, and each separate sub-division is made tantamount to a separate exception. The reference to pages in the exceptions are not intended to be exclusive, but the exception is intended to comprehend within its language full exception to all matters and things, including the computations to carry any finding into effect, stated in the report or exhibits bearing upon the identical subject, without regard to whether it is included within the pages stated in the exception or not.

Wherefore these defendants respectfully submit that the report of the Master should be overruled, set aside and held for naught, and a decree entered sustaining the validity of the rate statute and dismissing the bill.

Dated February 19, 1917.

ROGER I. WYKES,
Solicitor for Defendants.

In the United States District Court, Eastern District of Michigan, Southern Division.

THE DULUTH, SOUTH SHORE & ATLANTIC RAILWAY COMPANY, Complainant,

vs.

GRANT FELLOWS, CASSIUS L. GLASGOW, LAWTON T. HEMANS, Charles S. Cunningham, John R. Van Evera, Morgan W. Jopling and Fred S. Case, Defendants.

Complainant's Exceptions to Report of Special Master in Chancery Herein.

Comes now the Duluth, South Shore & Atlantic Railway Company, complainant herein, and excepts to the report of Herbert L. Baker, Special Master in Chancery herein, filed in this case on the first day of February, 1917, and for cause of exception, shows:

First. That said Special Master has in his report, in determining the value of complainant's property in the state of Michigan, used in its intra-state passenger business in Michigan, deducted from the real value of the complainant's real estate, shop buildings, shop tracks and shop machinery at Marquette, and complainant's round-house at Thomaston, and complainant's passenger station at Marquette, as found by him, the sum of $45,593.00, upon the theory that the proportion of the real value of the said property represented by said sum, was devoted by complainant, to railroad business in Wisconsin; whereas the Master should have found that all of the real value of said property as found by him, should be included in the
358 valuation of the property of complainant, utilized by it in its intrastate passenger business in Michigan. (Pp. 235-237 of Report.)

Second. That the Master in computing the value of complainant's property used in its intrastate passenger business in Michigan allowed for the item of taxes during construction, only the sum of $100,000; whereas the amount which should have been allowed by him for that item, is at least $150,000. (Pp. 213-218 of Report.)

Third. That the Master, in computing his modified train mileage ratio, used for the division of common property and for the division of certain common expenses between the passenger and freight business, included all of the time spent by freight trains at stations as time in which switching movement by such trains were being made; whereas, the facts are as shown by the evidence, that a large part of the time of trains at such stations, amounting to at least 15% thereof, is spent by train crews in unloading less than car-load freight, waiting for orders, or waiting for leaving time; and that during such 15% of the time, no switching operations are carried on. (Pp. 265 of Report.)

Fourth. That the Master, in considering the result of the operations of complainant's railroad in Michigan, failed and refused to consider and include with the operating expenses of said railroad, any charge for the annual depreciation of bridges, trestles, culverts and other structures; whereas, he should have included with the operating expenses, the annual depreciation of said structures as shown by the evidence introduced in the case. (Pp. 271-275 of Report.)

Fifth. That the Master, in computing the results of complainant's operations in Michigan in the year 1913, deducted from the operating expenses of such year, as shown by complainant's accounts, the sum of $102,148.00, all of which sum had been actually expended by complainant in said year in the state of Michigan, in the
359 maintenance and up-keep of its railroad property; whereas the said sum having been properly expended for said purpose should have been included in the operating expenses of complainant for said year. (Pp. 278-280 of Report.)

Sixth. The Master found that the minimum rate of return to which the plaintiff is entitled under the constitutional guaranty, is 6.5%; whereas, he should have found such rate of return to be at least 8%. (P. 389 of Report.)

Seventh. That the Master, in fixing the value of compplainant's property in Michigan used in its intrastate passenger business, allowed for the item of appreciation of road-bed, only the sum of $300,000; whereas, the evidence in the case showed that such appreciation amounted to at least $553,000. (Pp. 225-234 of Report.)

Eighth. That the Master, in finding the amount of taxes paid to the state of Michigan on the property of complainant located and used in its railroad operations in Michigan in the year 1913, deducte l therefrom the sum of $673.00, as representing the taxes on the Michigan property which was assigned by the Master to the business in Wisconsin, as shown in our first exception; whereas, he should have found the full amount of taxes paid by complainant on all its Michigan property without deductions. (Pp. 350 of Report.)

In the District Court of the United States for the Eastern District of Michigan, Southern Division. In Equity.

In Equity.

No. 4117.

DULUTH, SOUTH SHORE AND ATLANTIC RAILWAY COMPANY, Plaintiff,

vs.

CASSIUS L. GLASGOW et al., Defendants.

Opinion.

Prior to 1889, statutory rates of passenger fares in Michigan for railroads in plaintiff's class were three cents per mile in the Lower Peninsula and five cents per mile in the Upper Peninsula. 1 How. Stat. (1st Ed.) Section 3323. From 1889 to 1907, such rates of fares were respectively two and one-half cents and four cents per mile. 2 C. L. 1897, Section 6234. From 1907 to 1911, the rates were two and three cents per mile. Act No. 54 of Pub. Acts of 1907. In 1911, the State Legislature departed from what apparently had become the settled policy to permit a higher rate to be charged by railroads in the Northern Peninsula than in the Southern and

enacted the statute which is here attacked and which fixes a maximum passenger rate of two cents per mile for all roads of plaintiff's class in Michigan. Act No. 276 of Pub. Acts of 1911.

Probably the adoption and long continuance of the former policy of allowing higher rates of passenger fares in Northern Michigan was induced, in a large measure, by the greater difficulties of transportation which exist in that part of the state. These difficulties result from many different causes, such as prolonged and severe winter seasons and other unfavorable climatic conditions, entire absence of large cities, long distances between small cities and villages, sparsity of population and paucity of manufacturing plants and commercial enterprises other than those connected with the mining industry, all directly tending to reduce railroad traffic of all kinds to a minimum. While courts may not inquire into the motives which actuate legislative bodies in the enactment of laws, such a sudden and complete reversal of legislative policy as the reduction of rates of fare fifty per cent within a period of four years and the placing of railroads surrounded by such adverse conditions upon a parity with others much more favorably situated, increases the chances of unintentional and inadvertent transgression of constitutional limitations in specific instances and emphasizes the necessity for the most careful consideration of the merits of a case like the present one.

In July, 1911, after the enactment of the statute here under consideration but before it went into effect, this suit was commenced against the then Attorney General of the State of Michigan, the members of the State Railroad Commission and certain private patrons of the railroad, to restrain its enforcement upon the alleged ground that, as applied to this plaintiff, the law was in violation of several provisions of the Federal Constitution and hence invalid. Many of the claims and contentions, put forth and urged by both parties during the earlier stages of this inexcusably prolonged litigation, have been settled by the decisions of the Supreme
361 Court and are now abandoned. The large and important question which still remains to be determined is whether the so-called Michigan Two Cent Passenger Fare Law, as applied to plaintiff's railway, is confiscatory and, therefore, in violation of the "Due Process" clause of the Fourteenth Amendment.

When the bill was filed in this case, an application for an interlocutory injunction was made, and, pending the hearing upon such application, a restraining order was issued. For reasons which need not be stated, no complete hearing has been had and no decision has been made upon the application for a temporary injunction, but by consent, the original restraining order has been continued in force until the present time. Pursuant to stipulation and by order of court, the restraining order was conditioned that plaintiff should issue to each person buying Michigan intrastate passenger transportation a receipt or certificate by which it should bind itself to refund to the holder thereof the excess fare paid, if the validity of the statute finally should be sustained. The redemption of the rebate

receipts and the re-payment of excess fares were required to be secured, at first, by bond, and later, in addition to the bond, by the deposit of the moneys so received in designated banks subject to the order of the court. The fund so on deposit now amounts approximately to the sum of $750,000.00, the disposition of which depends upon the final outcome of this suit.

In May, 1912, the case was referred to a Special Master to take the proofs, to make the necessary computations, to find and state the facts and to report his findings and recommendations to the court. At intervals during a considerable period of time, very extensive proofs were taken, the testimony aside from many exhibits covering more than twelve thousand typewritten pages. The transactions and operations of plaintiff in the four fiscal years, 1910 to 1913, including its revenues, receipts, expenses and expenditures in each of those years, and also the condition and value of the property employed in each branch of its service, were inquired into and examined in minute detail. Elaborate schedules, tables and computations, based upon the theories and formulas of eminent engineers and expert accountants, were presented. Voluminous briefs were filed and lengthy oral arguments were had. Finally, on February 1, 1917, the Master filed a carefully prepared and well considered report covering more than 500 printed pages, and, in the main, sustaining the contentions of plaintiff. This report and the numerous objections and exceptions thereto are now a part of the present record.

Immediately upon the filing of the Master's report, this court, believing that a final decree directing the disposition of large sums of money, which have accrued since June 30, 1913, and vitally affecting the present and future operations of an extensive railroad system, ought not to be based upon proofs of conditions more than three and one-half years old, suggested and, in fact, insisted that the record should be brought down as nearly as possible to date by proofs taken in open Court and by a new hearing upon the proofs so taken. The suggested course of procedure met with the approval of counsel on both sides and was readily and willingly agreed to and adopted. New schedules, requiring the skilled labor of several experts and their assistants for several months, have been prepared, extensive tests have been made, and supplemental proofs have been taken in open court, covering plaintiff's railroad operations during the four fiscal years of 1914 to 1917 inclusive. The later testimony
362 and investigations have developed important changes, not only in the claims and theories advanced, but also in actual conditions shown to exist. The ultimate decision of the case must rest not alone upon the record made before the Master but also and, more especially, upon the evidence produced and taken at the present hearing.

This case presents all the difficult problems usually incident to rate cases as well as others of large importance not usually found in such cases. Each question, usual and unusual, which, in any way or degree, is controlling of, or has a material bearing upon, the final issue, must be separately considered and determined. To attempt

to do more than to state the conclusions reached and, as briefly as possible, to outline the reasons for such conclusions, would prolong this opinion beyond any reasonable limits.

1. Estoppel.

At the threshold of the investigation, we are met with the contention of defendants that plaintiff is estopped from denying or questioning the constitutionality and validity of the rate statute here under consideration. The somewhat shadowy basis of this contention is the fact that one or more of plaintiff's remote predecessors received from the United States and the State of Michigan grants of land in consideration for the original construction of some parts of the present line of railroad, and the claim that, in at least one instance, the grantee of such lands bound itself and its successors to abide by and to obey all laws of the state which thereafter might be enacted. A recital of the history of the origin and construction of the various parts and divisions of plaintiff's railroad and their consolidation into one system would be a long story. It is sufficient to say that a part of the northern division was built more than fifty years ago. Later, other parts were constructed at different times and by different companies. Plaintiff was incorporated in 1887 under the laws of this State authorizing a consolidation of railroad companies. Afterwards, plaintiff built connecting links and acquired by purchase other branches or divisions, thus forming and creating its present system. Some of the earlier corporations received land grants which, presumably, were fully earned. Of the lands granted, plaintiff has received, either directly or indirectly, only about 82,000 acres. The other lands were disposed of, lost through foreclosure, or retained by the companies receiving them. Except possibly in one instance, no conditions here material were attached to any of the grants. One corporation built about twenty miles of railroad from Marquette to Ishpeming and, in connection therewith, received a grant of lands. One of the provisions of the statute authorizing such grant, accepted by the grantee, was that, "All of said railroad companies shall, at all times and in all matters, be subject to the laws of this state, and to such rules and regulations as may from time to time, be enacted and provided by the Legislature of the State of Michigan, in regard to the management and disposition of the said lands not inconsistent with the provisions of this act, and the Act of Congress making said grant of land to this State." Defendants build their entire structure of estopped upon this patently ambiguous provision of the statute of 1857. Assuming, however, that the statute above quoted was intended to apply to the operations of the railroad and not solely to the disposition of lands, it was merely declaratory of the law as it would have existed in the absence of legislative enactment. It is a far cry from the little illy equipped railroad of half a century ago, through many changes of title and ownership, to the present
363 system nearly 500 miles in length, all of which, except twenty miles, has been acquired from other sources and free from any

uch conditions. This ancient statute forms no part of the law un-
er which plaintiff was organized and, therefore, is not in any sense
charter obligation. At this late day, it is impossible to read into
he statute an intention of the Legislature to bind not only the rail-
oad company then receiving the grant, but also all other companies
hich might, at any time, become associated or consolidated there-
ith, to observe and to obey every rate statute which thereafter might
e enacted even though the enforcement thereof would necessarily
esult in the confiscation of property. This contention cannot be
ustained.

2. Western Division and South Line.

The so-called Western Division (Nestoria to the State Line) of
laintiff's line was originally built as a connecting link and primarily
o create a through interstate road. This part of the railroad runs
hrough a sparsely settled region and the local traffic thereon is con-
iderably less than that upon other divisions of the system. Here
he interstate traffic exceeds the intrastate. However, the traffic of
oth kinds has continuously and substantially increased. Defend-
nts claim that the loss, if any, in plaintiff's passenger business has
ccurred upon this division and contend that the operations thereon
hould be segregated from the operations upon other divisions and
he loss charged mostly, if not wholly, to interstate business. They
urther claim that it was incumbent upon plaintiff to make such sepa-
ation and, not having done so, it has failed to establish with suffi-
ient certainty any right to relief.

The so-called South Line extends from Marquette to Negaunee
nd Ishpeming and was originally built by an independent
orporation as a competing road. In 1884, after it had been
perated for about one year, one of plaintiff's predecessors
urchased this line. Since then it has been used continuously for
oth interstate and intrastate passenger and freight traffic. Its use
n connection with the main line provides substantially a double
racked road between those cities. Defendants claim that the South
Line is unnecessary so far as intrastate traffic is concerned and con-
end that both the revenues derived therefrom and the expenses in-
urred thereon should be eliminated from the computations in this
ase.

These contentions are effectually answered by the rate statute itself,
hich provides "That in computing the passenger earnings per mile
f any company, the earnings and mileage of all branch roads owned,
eased, controlled or occupied, or that may hereafter be owned, leased,
ontrolled or occupied by such company, * * * shall be in-
luded in the computation, and the rate of fare shall be the same on
ll lines owned, leased, controlled or occupied by such company"
Plainly, no division or branch, used for intrastate traffic, can be seg-
egated from the other parts of the line or omitted from consideration
n determining whether a statutory rate is confiscatory or sufficiently
ompensatory. The Legislature, in fixing the rate of passenger fares,
has seen fit, at the same time and in the same statute, to require the

entire railroad line to be treated as a single unit. Under this statute, if the net income derived from plaintiff's intrastate passenger business as a whole is sufficient to yield a fair and reasonable return upon the value of the property employed in that service, it cannot recover, even though it may have suffered serious loss upon one or more divisions of its road. On the other hand, if the net income derived from its intrastate passenger business upon its whole road in Michi-
364 gan is insufficient to yield a fair and reasonable return upon the value of the property employed in that service, it is entitled to a decree, even though such business upon one or more of its divisions may have been profitable. Court decisions upon rate statutes containing no such provisions have little application and are not controlling here.

3. Mineral Range Railroad.

The Village of Houghton is the northern terminus of plaintiff's line of railroad. The Mineral Range Railroad Company owns, maintains and operates a line from Houghton to Calumet, a distance of fourteen miles. Calumet is the largest center of population in the Upper Peninsula of Michigan. The Mineral Range Company does not operate passenger trains between those places, but, under a contract between the two companies plaintiff runs its passenger trains to Calumet over the Mineral Range road and turns over to that company all the passenger fares earned upon its line. The distance from Marquette to Calumet is about 98 miles and, by apportioning to the Mineral Range Railroad 14/98ths of the train expenses from Marquette to Calumet, defendants reach the conclusion that about $20,000 per year is the cost to plaintiff of the operation of its passenger trains north of Houghton. In fact, the actual extra expense is considerably less than such estimated amount, because enginemen and trainmen would receive nearly the same wages if their run terminated at Houghton. The claim is that, in computing net income, this sum of about $20,000 should be deducted from plaintiff's operating expenses. This contention is untenable. Plaintiff's contract with the Mineral Range Railroad Company is in effect a lease of the right of way for passenger trains from Houghton to Calumet in consideration of the passenger fares collected upon that part of the line. Plaintiff's purpose in making the contract was to secure traffic upon its own rails. If plaintiff had leased the right of way for the sum of $20,000 and had collected and retained the passenger fares, no question could arise as to its right to include in its operating expenses the re-tal so paid.

Viewed from another standpoint, this expense is similar to that of advertising and of commissions to outside agents to obtain traffic. No question is raised as to the right to include such charges in operating expenses. Moreover, it appears from the record that plaintiff receives from the Chicago and Northwestern Railroad Company and the Chicago, Milwaukee and St. Paul Railway Company the sum of $14,000 per annum, in addition to passenger fares, for hauling the trains of those companies over plaintiff's line to Houghton and thence

to Calumet. The main consideration for the payment of this money is to enable those companies to reach Calumet. In computing plaintiff's net income this sum of $14,000 has been included in its earnings.

4. Rate of Return.

The two cent rate has not been put into effect on plaintiff's railroad and no tests have been made to determine whether the resulting reduction in fares would stimulate travel to such an extent as to offset the estimated loss. Under these circumstances, defendants insist that, before plaintiff can be entitled to a decree in its favor, it must have established conclusively not only that the statutory rate is not compensatory, but also, that its enforcement will make impossible any substantial return. This question seems to have been decided by the Supreme Court against the claim of defendants in the recent case of Rowland vs. Boyle, 244 U. S. 106-110.

365 To ascertain the loss in each year which would have resulted from the reduction of fares to two cents per mile, plaintiff has computed the amount of fares at two cents per mile for every mile of travel to which the rate could have applied and has subtracted that sum from the amount actually received under the three cent rate. It is certain that this method of computation is unfair to plaintiff, because, owing to competitive conditions, excursion rates, etc., if the two cent rate had been in force, plaintiff would not have received full two cents per mile for every passenger mile of travel. For example, in 1914, this railroad transported state troops about one million passenger miles at a statutory rate of one cent per mile. In its computations of loss, all of this travel has been included at two cents per mile. Again, in 1907, the State Legislature reduced the rate from four cents to three cents. Such reduction of rate did not stimulate travel to an appreciable extent. Hence, it is quite evident that industrial and commercial conditions, rather than rates, determine amount of travel. At all events, as said by the Supreme Court in the case above cited, "The direct effect of the reduction is plain—the remote one is at best a guess."

5. Sleeping, Dining and Chair Cars.

It is believed that, in this case, for the first time in the history of railroad rate litigation in this country, the surprising claim has been put forth that, in computing net income and rate of return, no part of the expense of hauling sleeping, dining and chair cars should be included in the passenger operating expenses of the railroad. This contention, which is urged with earnest insistence, involves the theoretical cutting of each passenger train into sections and charging to the sleeper and diner section a proportionate part, based upon weight, of all operating expenses, without crediting that section of the train with any part of the passenger fares collected. In their computations, defendants have charged to sleepers and diners a proportionate part of each operating expense account (except those in the "traffic" group) including such constant accounts

as superintendence, wages of trainmen and enginemen, maintenance of fences and crossings, and others of like character. The aggregate of these charges, averaging about $175,000 per year, has been deducted from the passenger operating expenses and set aside and disregarded in obtaining the net income from passenger service. In the last analysis, defendant's theory rests upon the assumption that the railroad company is not required by law to furnish sleeper and diner service and that there is, at all times, sufficient space in the day coaches for the accommodation of the traveling public. If this contention were sound, it is safe to say that no railroad of plaintiff's class in the State of Michigan could hope to win a rate case like the present one. But the contention is not sound. As early as 1875, railroads in Michigan were authorized by legislative enactment to use sleeping cars, parlor cars and chair cars for the transportation of passengers and to charge a reasonable compensation for such use in addition to the regular passenger fares allowed by law. 3 How. Stat. (2nd Ed.) Section 6696. That statute has been in force and acted upon for more than forty years. Every railroad of any considerable size in the state is furnishing such service. What formerly may have been a convenience has become a necessity. It is conceded that it would be poor business policy for any railroad to abandon the operation of these cars. In 1911, when the statute here under consideration was enacted, these conditions had long existed and it must be presumed that the Legislature had such conditions in mind and, in the absence of express declaration to that effect,
366 did not intend to limit, alter or overturn fixed and prevailing methods of railway travel and operation. Indeed, the statute itself empowers the railroad company "to regulate the time and manner in which passengers and property shall be transported" and thus, in express terms sanctions the use of all reasonable facilities for the transportation and convenience of the traveling public. No claim is made that the use of such cars is either unreasonable or unnecessary. It is also probably true that the State Railroad Commission, clothed as it is with broad powers, could compel this plaintiff to operate chair, sleeping and dining cars.

Referring once again to the statute here under consideration, we find that therein railroads are classified upon the bases of the gross earnings of passenger trains. No distinction is made between sleeping cars and day coaches. While this classification is not in any wise controlling of the exact question here presented, it is a recognition of the fact that the operation of these special cars is an integral part of the passenger service from which it cannot be divorced by fine spun theories unknown in actual experience and practice.

A subordinate claim of defendants is that, if the operation of sleeping, dining and chair cars cannot be wholly eliminated from consideration, at least the expense of hauling such cars should be divided between state and interstate business upon the basis of the interstate and intrastate passenger miles traveled therein instead of the interstate and intrastate passenger traffic upon the whole line. Elaborate schedules and tables have been prepared showing the number of interstate and intrastate passenger miles in sleeping cars upon

each division of the road. Upon one division the intrastate travel in such cars far exceeds the interstate, while the reverse is true upon the other divisions. This theory is equally untenable. The passenger train as a whole, with engine, baggage cars and all coaches, is a single unit provided for the transportation of interstate and intrastate passengers indiscriminately and alike. The train is run regardless of whether interstate or intrastate, or both interstate or intrastate, passengers are to be carried. Neither kind of traffic is incidental to or subordinate to the other.

6. Mail and Express.

Both parties have treated the carriage of mail and express as an independent branch of the passenger service. As in the case of diners and sleepers, defendants have divided each expense account upon the basis of the space occupied by and the weight of mail and express matter. Plaintiff has adopted a fixed percentage of the total operating expenses as the cost of such transportation. While the two methods are not directly related, the results reached are substantially the same. With the exception of one year, the mail and express business has been profitable and has been a benefit rather than a burden upon the passenger business. In the computations, the results of which are hereinafter stated, this profit has been included in the passenger revenues, while the one year's loss has been disregarded and not deducted from such revenues. Either method of treating mail and express is too unfavorable to plaintiff. This business is a mere incident to or by-product of the passenger service.

Neither mail nor express is handled by railroad employes. For the most part, they are carried in one end of the baggage car and add little or nothing to the general expenses. The extra wear upon the track and track structure is inconsequential and inappreciable. Constant expenses such as the wages of trainmen and enginemen and the cost of the upkeep of fences, crossings, signals, stations,
367 etc., are not at all affected. If these constant charges had been left in the passenger accounts as they should have been, the profit arising from the transportation of mail and express upon this railroad would have been increased more than $20,000.00 per year, and the net income from passenger traffic would have been correspondingly decreased, with a resultant substantial reduction in the final rate of return from intrastate passenger business. However, as before stated, this profit, whatever it may have been, has been credited, in this decision, to passenger revenue.

7. Values.

In view of the conclusions reached, the differences between the parties as to the value of plaintiff's railroad property become quite immaterial and need not be discussed except in a most general way. In ascertaining the values of both fixed property and equipment, plaintiff has adopted and used the theory of cost of reproduction

new, less depreciation. This method has received the approval of many courts and, perhaps, is the best yet devised for measuring the values of railroad property and industrial plants which are not bought and sold in open market and which may be said to have no market value in the sense in which that term is usually employed. Yet the adoption of this method to the exclusion of all other factors is both unsatisfactory and unsafe. One railroad property may be much more valuable than another, even though the cost of the reproduction of each may be the same. Some railroads are worth much more and others much less than the actual cost of replacing them. For example, it may well be doubted that, if plaintiff's railroad were now being constructed new, two lines would be built paralleling each other from Marquette to Ishpeming, or that the Western Division would be placed in its exact present location. Industrial activities and density of population and traffic are important elements which cannot be ignored in reckoning values of railroad property.

Some of plaintiff's claims as to values must be wholly rejected. In any plan for the actual construction of a railroad and in the preliminary estimates of its cost, an allowance for unforeseen contingencies may be proper, but, in determining whether a given rate is confiscatory, indulgence in speculation as to what may or may not happen cannot be permitted. The claim for application of roadbed is quite uncertain and speculative. Undoubtedly, a well maintained roadbed increases in efficiency and value with age. The older it becomes the less is the cost of its repairs and upkeep. But, in a case of this kind, an allowance for such appreciation must be supported by positive proofs which measure the value thereof in terms of money. The reproduction cost theory also includes a theoretical charge for "Engineering on Equipment." In this day and age, locomotives, cars, both passenger and freight, and all equipment are standardized and the prices thereof can be readily ascertained without the assistance of engineers. In any event, this engineering cost, if any, is included in the price paid and, in this case, is fully represented in the estimates of both parties.

On the other hand, whether values be measured by constantly increasing unit prices, prevailing from year to year, or "normal" unit prices of several years ago, the estimates and appraisals prepared and presented by defendants are in many respects much too low:

Lands.—A great volume of testimony by many witnesses has been taken on the question of the value of the right of way and station grounds of this railroad. In the main, defendants have adopted the lowest values placed thereon by any of the wit-
368 nesses. The Master, who saw and heard the witnesses, fixed the value of these lands, in 1913, at the sum of $1,780,222.00. Defendants contend that the actual value is upwards of $600,000.00 less than that sum. Without going into details and disregarding all claimed extra values arising from unused shore rights, rights of way in streets, rights of surface support through mineral lands, locations peculiarly adapted to and suitable for railroad purposes,

and added increments for platting into lots and streets, it is certain that defendants' estimate is at least $400,000.00 too small.

Grading and Track Laying and Surfacing.—These items have also been the subjects of much discussion and controversy. Defendants claim values nearly $600,000 less than those found by the Master. In respect to grading, the difference consists largely in the different unit prices adopted, and, in respect to track laying and surfacing, in the diverse claims as to what is included therein and as to what methods should be employed. A careful examination of the evidence leads to the conclusion that the Master's findings are fully and fairly sustained. Defendants' estimates should be increased to the sum stated in his report.

Ties.—Defendants' valuation of ties is less than the price actually paid by plaintiff during the last four years. Their estimate upon this item should be substantially increased.

Working Capital.—Defendants have not allowed anything for working capital although the record shows that plaintiff has had on hand upwards of $100,000 for use in its current business. Working capital is necessary to the successful operation of any railroad and, when actually possessed, should be included in the appraised value of its property.

Defendants' estimates upon other items of both fixed property and equipment should be increased. If it were necessary, in the decision of this case, to determine accurately the value of plaintiff's property used in its railroad business, defendants' claimed values would have to be increased more than one million dollars.

8. Factors, Ratios and Divisions.

This case is not an exception to the general rule in rate cases that the greatest difficulties are encountered in attempted divisions of common property and expenses, not capable of direct allocation, between passenger and freight business. In the main, but with some exceptions, both parties agree that the final division of common passenger property and expenses between state and interstate business shall be upon the basis of the number of passenger miles of transportation in each class of traffic. Plaintiff rightly contends that the cost per mile of intrastate passenger transportation is more than that of interstate, but concedes the practical impossibility of proving definitely and accurately the amount of such extra cost.

In the division of common property and expense, (particularly the right of way, station buildings and grounds and track structure schedules and expense accounts in the "maintenance of way and structures" group) three radically different factors or ratios have been applied and used, and a fourth has been suggested for possible application by the court, if the others shall be rejected. Plaintiff has adopted and advocates the so-called Modified Revenue Train Mile method of division. By this method, unallocated property and expenses are divided between passenger and freight service upon the basis of the number of revenue train miles (including, or modi-

fied by, switching movements upon common tracks) made
369 in each service. Here the revenue train is the common unit for all purposes of comparison. Differences in character of service performed and results accomplished are not recognized. Weight of the train and its load and varying degrees of perfection and efficiency of equipment are wholly disregarded. To the comparatively short and light passenger train is attributed the same use and the same upkeep cost of the track structure as to the long and heavy freight train. It is urged with much insistence that these differences are leveled by the greater perfection and efficiency of equipment and roadbed and track structure required for the higher speed of the passenger train and for the protection, comfort and safety of passengers. There is much to be said in favor of the employment of this basis of division, and, upon the whole record, as against those advanced by defendants, its use is supported and sustained by the greater weight of the evidence. But a careful review of the whole situation, including the number of trains moved, the number, size and character of the engines, cars and other equipment employed, the number of employes, the wages paid and the volume of traffic in each service, leads at least to serious doubt whether the employment of the Modified Revenue Train Mile method does not accord and assign somewhat too great a proportion of the common property and common expense to the passenger business.

Defendants have proposed two methods or bases of division of unallocated common property and expense, the preferred and primary one being what is termed the Gross Ton Mile ratio. Here one ton one mile is the common unit for all purposes of comparison. Weight and distances are the sole elements considered. All others are disregarded. Assuming, as defendants contend, that wear and strain upon the track structures are not increased by the higher speed of passenger trains, and, further, that plaintiff's roadbed and superstructure are not maintained at a higher degree of perfection and efficiency than is required for the freight traffic thereon, still two vital defects in the Gross Ton Mile theory are plainly evident. The first is that, in measuring use and expense, the carriage of a ton of human beings is treated exactly like the carriage of a ton of coal or iron ore. The second is the fallacy that, the more defective and ineffcient the tools and equipment, the greater the use of the property to and upon which they are applied. Passengers are not transported by weight and the more perfect and efficient the tools and equipment the larger their use and the use of that to which they are applied. In the transportation of passengers and freight, no comparable common ton unit exists. Wear is not always a true measure of use. The greater wear and strain caused by the flat wheels of a box car do not indicate a larger use of the steel rails of the track, but the exact reverse. As regards the division of common expense accounts, this method ignores all causes of cost of upkeep other than wear and strain. In fact, the larger proportion of the expense of the maintenance of way and structures is caused by weather or action of the elements. Ties, ballast, grading, ditches, bridges and even rails, deteriorate and must be repaired and replaced whether they are used or not used for

train operations. The life of a tie is not much longer when in use than when not in use. Any theory which wholly disregards such important elements of expense must be rejected.

The other and secondary method of division proposed by defendants is called the Time Ratio. This factor has been used in dividing property values of right of way, track structures, telegraph
370 and telephone lines and station buildings and fixtures, and also in dividing a few expense accounts, such as maintenance of bridges, trestles and culverts, grade crossings, fences, cattle guards and signs and removal of snow and ice. Here time of train movement is the unit used for all purposes of comparison. Distance, weight and kind are entirely ignored. Of this method it is sufficient to say that neither passengers nor freight are transported upon the basis of the time consumed in their travel. A passenger pays a fixed amount per mile of travel regardless of the time required for his journey. Likewise a ton or a carload of freight. In a strict and accurate sense, the entire railroad property is at all times jointly used and employed in both freight and passenger service. Hence the time of movement of a particular train, or of all trains, bears no relation, direct or indirect, to the use of the property as a whole.

The basis of division suggested by plaintiff, in case the ratio proposed by itself, for any reason, should be rejected, is the one adopted, after careful consideration of many others, by the Interstate Commerce Commission in the Western Passenger Fares Case, 37 I. C. C. Rep. 1-22-23, where it was said: "The fuel consumed by road locomotives drawing trains over the road; the lubricants, water, and other supplies for these locomotives; the train supplies; the wages of trainmen and enginemen, are all separated between passenger and freight, and each by itself or the aggregate of all will constitute an index of the utilization of the tracks by these two branches of the service." In the Arkansas Rate Case (Rowland vs. Boyle, 244 U. S. 106), this method of division was referred to, if not with approval, certainly without criticism, by the Supreme Court. It gives to freight a considerably larger and to passenger a correspondingly smaller percentage of property and expense than is done by plaintiff's assignment, and thereby dissolves and removes whatever doubt may have existed as to the correctness of the ultimate results reached by the application of the Revenue Train Mile ratio.

The percentages by this method of assignment to passenger service, compared with the percentages used by the Master for the years 1912 and 1913, and by plaintiff, for the four year period from 1914 to 1917 inclusive, are as follows:

Year.	I. C. C. ratio.	Modified revenue train-mile ratio.
1912	36.24%	42.36%
1913	34.80%	41.91%
1914	37.62%	45.09%
1915	41.21%	48.65%
1916	37.36%	44.63%
1917	33.93%	42.21%

At the request and under the direction and supervision of the Court, expert accountants, (one from each side by agreement) have made careful, accurate and detailed computations in which the lesser percentages above stated have been applied, first, to defendants' lowest common property values, wherever time or gross weight percentages have been employed, and, second, to the common operating expense accounts, wherever the modified revenue train mile percentage had been employed, and also to the unallocated portions of the transportation expense accounts: Dispatching Trains, Station Employes and Station Supplies. The necessary changes have been made in all overhead accounts. Defendants' estimates of the values of the railroad property have been accepted. There is no dispute con-
371 cerning the revenue or the totals of operating expenses. The difference between the parties in the divisions of the expense accounts, not separated, according to the new and substituted percentages, are too small materially to affect the results and, hence, plaintiff's divisions of these remaining accounts have been accepted. Taxes have been apportioned to passenger and freight upon the basis of the total value of property in each service. The profits derived from mail and express business have been included in the passenger revenues, while the loss incurred in one year has been excluded. The total passenger property has been divided between interstate and intrastate business upon the basis of the passenger miles of transportation in each service. The estimated loss which would have resulted from the application of the two cent rate to plaintiff's passenger business, computed in the manner hereinbefore stated, has been deducted from the net income under the three cent rate. The final net results of these computations for the six years, 1912 to 1917 inclusive, are as follows:

1912.	Total.	Intra.	Inter.
Value of Passenger Property.....	$2,882,375	$1,834,055	$1,048,320
Net Income under Two-cent Rate.....	100,875	78,609	22,266
Rate of Return.....	3.500%	4.286%	2.124%
1913.	**Total.**	**Intra.**	**Inter.**

Net Income under Two-cent Rate.....	72,892	55,339	17,553
Rate of Return.....	2.61%	3.02%	1.83%
1914.	**Total.**	**Intra.**	**Inter.**
Value of Passenger Property.....	$3,081,623	$1,993,453	$1,088,095
Net Income under Two-cent Rate.....	91,191	61,808	29,383
Rate of Return.....	2.96%	3.10%	2.70%
1915.	**Total.**	**Intra.**	**Inter.**
Value of Passenger Property.....	$3,327,343	$2,338,789	$988,554
Net Income under Two-cent Rate.....	Loss 8,007	Loss 5,527	Loss 2,480
Rate of Return.....	0.0%	0.0%	0.0%

1916.	Total.	Intra.	Inter.
Value of Passenger Property.....	$3,073,670	$2,176,466	$897,204
Net Income under Two-cent Rate.....	42,219	25,832	16,387
Rate of Return.....	1.37%	1.19%	1.83%

1917.	Total.	Intra.	Inter.
Value of Passenger Property.....	$2,889,648	$2,042,114	$847,534
Net Income under Two-cent Rate.....	37,957	20,023	17,934
Rate of Return.....	1.31%	.98%	2.12%

372 Averages for Six Years, 1912 to 1917.

	Total.	Intra.	Inter.
Value of Passenger Property.....	$3,009,685	$2,037,812	$971,873
Net Income under Two-cent Rate.....	56,188	39,347	16,841
Rate of Return.....	1.87%	1.93%	1.73%

Averages for Four Years, 1914 to 1917.

	Total.	Intra.	Inter.
Value of Passenger Property.....	$3,003,052	$2,137,705	$955,347
Net Income under Two-cent Rate.....	40,840	25,534	15,306
Rate of Return.....	1.32%	1.20%	1.60%

It is apparent that, if, in the foregoing computations, actual and fair values of property, instead of defendants' lowest estimates, had been used, and mail and express transportation had been treated as a by-product and credited with its own profits, (as strict accuracy required) the results would have shown a rate of return in intrastate passenger business of no more than 2 per cent during the first three years and a loss in each of the last three years.

For the purpose of further comparison and demonstration, but with some patent inconsistency, another ratio has been obtained by adding to the road accounts used by the Interstate Commerce Commission the corresponding yard expense accounts of the fuel consumed by yard Locomotives: the lubricants, water and other supplies for these locomotives; the yard supplies; and the wages of yard conductors, brakemen and enginemen. These yard accounts are nearly all freight expense and consequently their addition to the road accounts further reduce the percentages of passenger property and expense assignment. The percentages so obtained are 31.17% for 1912; 30.42% for 1913; 33.00% for 1914; 36.17% for 1915; 31.95% for 1916; and 29.35% for 1917. The substitution of these reduced percentages and their application, in the manner above stated, yield the following results:

1912.	Total.	Intra.	Inter.
Value of Passenger Property.....	$2,569,461	$1,634,948	$934,513
Net Income under Two-cent Rate.....	131,893	99,152	32,741
Rate of Return.....	5.133%	6.065%	3.504%

1913.	Total.	Intra.	Inter.
Value of Passenger Property.....	$2,523,159	$1,654,688	$868,471
Net Income under Two-cent Rate.....	105,107	77,204	27,903
Rate of Return.....	4.17%	4.67%	3.21%

1914.	Total.	Intra.	Inter.
Value of Passenger Property.....	$2,788,674	$1,803,993	$984,681
Net Income under Two-cent Rate.....	128,435	86,685	41,750
Rate of Return.....	4.61%	4.81%	4.24%

373

1915.	Total.	Intra.	Inter.
Value of Passenger Property.....	$3,006,345	$2,113,160	$893,185

Net Income under Two-cent Rate.....	62,672	38,243	24,429
Rate of Return.....	2.42%	2.10%	3.22%

Averages for Six Years, 1912 to 1917.

	Total.	Intra.	Inter.
Value of Passenger Property.....	$2,700,697	$1,827,968	$872,729
Net Income under Two-cent Rate.....	88,052	61,601	26,451
Rate of Return.....	3.26%	3.37%	3.20%

Averages for Four Years, 1914 to 1917.

	Total.	Intra.	Inter.
Value of Passenger Property.....	$2,777,890	$1,919,543	$858,347
Net Income under Two-cent Rate.....	72,828	48,312	24,516
Rate of Return.....	2.62%	2.52%	2.86%

These figures demonstrate conclusively that, upon any reasonable hypothesis, during the last six years, and particularly during the more important period of the last four years, plaintiff would not

have received, under a two cent rate, an adequate return from its intrastate passenger business. This conclusion accords with and is confirmed by many known facts. The passenger travel upon this railroad is comparatively light and very much less than that upon roads of the same class traversing sparsely settled portions of the Lower Peninsula of Michigan. Climatic conditions are extremely unfavorable. No large cities are served, either along the line of road or at terminals. Distances between even small centers of population are great. Agricultural development is small. The situation and conditions shown by this record are quite similar to those of the Minneapolis and St. Louis Railroad Company, described in the Minnesota Rate Cases, where the Supreme Court, notwithstanding erroneous methods of computation and apportionment, declared the statutory rate to be confiscatory. In the Arkansas Rate Case, where the rate of return was little, if any, larger than here, the same Court sustained the contentions of the railroad company. It is settled by experience and by authority that the cost per mile of the transportation of the intrastate passenger is more than that of the inter-
374–5 state, and yet, in the Western Passenger Fares Case, the Interstate Commerce Commission granted to this plaintiff, and to other railroads much more favorably situated, the right to charge two and four tenths cents per mile for interstate transportation. Plaintiff has never paid a dividend upon its stock and, from its income, has never been able to pay more than a small portion of the interest upon its bonded indebtedness. There is no charge of mismanagement in recent years. Operating expenses have steadily increased and are likely to continue to increase for some time to come.

Plaintiff is entitled to a decree in its favor. The precise form thereof will be settled after hearing counsel for both parties. At the time of the settlement of the decree, the effect of the recent action of the Government in taking over the control and operation of the railroads of the country, including this one, upon the extent and scope of the relief by injunction which should be granted, will be considered and determined.

DULUTH, SOUTH SHORE & ATLANTIC RAILWAY COMPANY, Plaintiff,

vs.

CASSIUS L. GLASGOW, CHARLES S. CUNNINGHAM, ADDISON A. KEISER, Alex. J. Groesbeck, Morgan W. Jopling, John R. Van Evera, and Fred S. Case, Defendants.

Final Decree.

It appearing to the Court that the report of Herbert L. Baker, Esq., Special Master heretofore appointed herein, which was filed on February 1st, 1917, was based upon testimony which related to the valuation of plaintiff's property used in its passenger business in the State of Michigan, and the results of the operations of the Plaintiff Company's business solely for the fiscal years 1910, 1911, 1912, and 1913, ending June 30th of each year, the Court held the same insufficient as a basis for an adjudication of all the issues involved in this case, for the reason that to properly adjudicate the issues herein, it was necessary that testimony covering the valuation of said property and the operations of the plaintiff company during the fiscal years which had intervened between 1913 and the final hearing, should be presented and considered by the Court.

The Court thereupon directed the parties to prepare and present testimony covering the valuation of said property and the operations of the plaintiff company during such intervening fiscal years,
377 and directed that the same should be presented in open Court.

Thereafter, in accordance with such direction, testimony of respective parties covering the valuation of said property and the results of the operations of the company during said intervening fiscal years, to-wit: 1914, 1915, 1916, 1917, was presented to the Court. And the case was submitted to the Court upon the testimony introduced before the Master, and by him returned to the Court, together with the testimony introduced in open Court as aforesaid, and the arguments of Counsel. And the Court having considered the same,

It is thereupon ordered, adjudged and decreed as follows:

1. That the Act of the Legislature of the State of Michigan complained of in this suit, being Act Number 276 of the Public Acts of the State of Michigan for the year 1911, was, at the time when it was enacted and approved, and became effective so far as the same affected the plaintiff company, repugnant to, and violative of the Constitution of the United States, forasmuch as by the provisions thereof, the plaintiff railway company could not exact for the transportation of passengers from one point to another within the State of Michigan, charges which would yield to said company reasonable compensation for such services. That ever since the said act became effective, the said act has been and now is, so far as it relates to the plaintiff company, repugnant to, and violative of the Constitution of the United States, forasmuch as by the provisions of said act, the said plaintiff

railway company could not exact for the transportation of pas-
378 sengers from one point to another within the State of Michigan, charges which would yield to said company reasonable compensation for such services; and the said act so far as it relates to the plaintiff company, was, at the time it became effective and ever since has been and now is void and of no force.

2. That the said Cassius L. Glasgow, Charles S. Cunninghom, and Addison A. Keiser, constituting the Railroad Commission of the State of Michigan and their successors in office, be and each of them is hereby permanently enjoined and restrained from taking any steps or instituting any proceedings for the enforcement of the said act against said plaintiff company or its officers or representatives, and from entertaining, hearing or determining any complaint against the plaintiff company for or on account of any act or thing by it, its officers, servants, agents, or employees done, suffered or omitted, which may be forbidden or commanded by said legislative act; and from instituting or prosecuting or causing to be instituted or prosecuted any action or proceeding, civil or criminal against the plaintiff company or its officers or representatives, for any act or thing done, suffered or omitted, which may be forbidden or commanded by said act; and said defendant Alex. J. Groesbeck, Attorney General of the State of Michigan be and he hereby is in like manner enjoined from bringing or causing to be brought or prosecuted, any proceeding by way of injunction, mandamus, civil action or indictment against said company or its officers, on account of any action or omission on the part of the plaintiff company commanded or forbidden by the said legislative act.

379 3. That the said defendants Morgan W. Jopling, John R. Van Evera and Fred S. Case, and all other persons making use of plaintiff's line of railway, be and they are and each of them hereby is permanently enjoined and restrained from instituting or causing to be instituted any action or proceeding to collect from plaintiff company, damages or penalties for any violation by the plaintiff company of the said act.

4. That neither party recover costs herein.

5. It is further ordered that the order of this court, dated the 26th day of September, 1911, requiring the plaintiff, during the pendency of this suit, to issue to all persons travelling intrastate on its road, refund coupons agreeing to refund to the holder of the same an amount equal to the difference between the rate of fare charged such passenger for transportation and the rate prescribed in the act complained of, is hereby set aside and annulled and said coupons are adjudged to be of no validity or value, and the bond provided to be given and given by said plaintiff for the redemption of said coupons is hereby discharged; and the order heretofore entered on the 22nd day of October, 1915, directing the plaintiff to set aside a special bank deposit for the redemption of said coupons is also set aside and annulled, and the banks in which deposits of funds have been made by the plaintiff in accordance with said order are hereby ordered to pay over to the plaintiff at its request all sums of money deposited by the plaintiff in said banks, or the securities representing the same, if any of the said

moneys have been invested under the orders of this court, and all said moneys and the securities representing the same, if invested,
380 are hereby freed from any trust imposed upon them by said order.

Provided, however, in order that the rights of all parties may be protected and the status quo preserved during a review of this cause upon appeal, if such appeal is desired, the operation of this section (section 5) of this decree is hereby suspended for a period of twenty days from the date of entry hereof to permit an appeal by the defendants, and if such appeal is within said time duly allowed, such operation of said section is further suspended for and during the pendency of such appeal until the final determination thereof, during which time said orders shall continue in full force, except as herein modified. And it is decreed that if defendants appeal herein as hereinabove mentioned, then pending the determination of this case upon such appeal the plaintiff shall comply with said order to the extent of issuing and delivering coupons as therein provided; but from the date hereof plaintiff will not be required to make any special or other deposit for the redemption of said coupons. But the bond heretofore given under said order and the special deposits heretofore made under said order shall stand as security as well for the redemption of the coupons heretofore issued under said order, as the coupons which may hereafter be issued as hereinabove provided.

6. It is further ordered, adjudged and decreed that the defendants herein, members of the Railroad Commission of the State of Michigan, or the Attorney General may hereafter, when the circumstances have changed so that the rates fixed in the said act shall yield to the said plaintiff company reasonable compensation for the serv-
381 ices aforesaid, apply to this Court by supplemental bill or otherwise, as they may be advised, for a further order in that behalf.

7. Provided further, that nothing herein contained shall in any manner be construed as in any manner affecting or as a limitation upon or interference with the control, regulation, or fixing of rates for said railroad by the Federal Government or any agency thereof.

Dated this 13th day of February, 1918.

382 DULUTH, SOUTH SHORE & ATLANTIC RAILWAY COMPANY, Plaintiff,

vs.

CASSIUS L. GLASGOW, CHARLES S. CUNNINGHAM, ADDISON A. KEISER, Alex. J. Groesbeck, Morgan W. Jopling, John R. Van Evera, and Fred S. Case, Defendants.

The matter of application for allowance of Master's compensation in the above entitled matter having come on to be heard, the Court

hereby fixes such compensation at $14,000; one-half of any balance yet remaining unpaid to be paid by each party respectively. And that the defendants pay in addition $25.40 expenses incurred by the Master in traveling to take testimony of witnesses produced by the defendants at Chicago.

383 DULUTH, SOUTH SHORE & ATLANTIC RAILWAY COMPANY, Plaintiff,

vs.

CASSIUS L. GLASGOW, CHARLES S. CUNNINGHAM, ADDISON A. KEISER, Alex. J. Groesbeck, Morgan W. Jopling, John R. Van Evera, and Fred S. Case, Defendants.

It appearing to the Court that Lawton T. Hemans one of the defendants and member of the Michigan Railroad Commission is deceased and that Addison A. Keiser of Ludington, Michigan has succeeded said Hemans as a member of said Railroad Commission; and it also appearing that the defendant Grant Fellows has been succeeded in the office of Attorney General for the State of Michigan by Alex J. Groesbeck of Detroit, Michigan; now, therefore, by agreement of the parties had in open Court it is ordered that the said Addison A. Keiser as a member of said Michigan Railroad Commission and Alex J. Groesbeck as Attorney General of the State of Michigan, be and they are hereby substituted as defendants in the above cause in place of said Lawton T. Hemans, deceased, and Grant Fellows as attorney general; and the said substituted defendants having entered their respective appearances in this cause as defendants, through their solicitor Alex J. Groesbeck, Attorney General of the State of Michigan, it is further ordered, by consent of the parties, that the pleadings heretofore filed in the above entitled cause for and on be-
384 half of the defendants, stand as the pleadings for the said substituted defendants.

Petition for and Allowance of Appeal and Assignment of Errors.

United States District Court, Eastern District of Michigan, Southern Division. In Equity.

Former C. C. Case 4117.

DULUTH, SOUTH SHORE & ATLANTIC RAILWAY COMPANY, Plaintiff and Appellee,

v.

ALEX. J. GROESBECK, CASSIUS L. GLASGOW, CHARLES S. CUNNINGHAM, Addison A. Keiser, Morgan W. Jopling, John R. Van Evera, and Fred S. Case, Defendants and Appellants.

On this 5th day of March, 1918, at 11 o'clock A. M. the above named defendants, Alex J. Groesbeck, Cassius L. Glasgow, Charles S. Cunningham and Addison A. Keiser, presented to the Court in open session a petition asking for the allowance of an appeal to the Supreme Court of the United States from the final judgment and decree entered in said action in this Court on the 13th day of February, 1918, and a severance of the other defendants and permission to appeal without joining such other defendants.

It was made to appear that notices of the presentation of this application, at this time and place, had been duly served upon all the other defendants, namely, Morgan W. Jopling, John R. Van Evera and Fred S. Case. Roger I. Wykes appeared as counsel for the petitioning defendants, and none of the other parties plaintiff or defendant appeared.

Upon reading and filing the said petition for appeal, it is ordered that said appeal be, and the same is hereby permitted to the parties requesting the same, without the other defendants joining, and the said appeal is hereby allowed to the said defendants Groesbeck, Glasgow, Cunningham and Keiser as prayed in said petition, without the giving of bond, the giving of a bond having been waived by plaintiff in open court.

C. W. SESSIONS,
District Judge, Sitting by Designation.

DULUTH, SOUTH SHORE & ATLANTIC RAILWAY COMPANY, Plaintiff and Appellee,

vs.

ALEX. J. GROESBECK, CASSIUS L. GLASGOW, CHARLES S. CUNNINGHAM, Addison A. Keiser, Morgan W. Jopling, John R. Van Evera, and Fred S. Case, Defendants and Appellants.

Now come the above-named defendants, Alex. J. Groesbeck, Cassius L. Glasgow, Charles S. Cunningham and Addison A. Keiser, who feeling aggrieved by the decree rendered and entered in the above entitled cause on the 13th day of February, 1918, desire to appeal therefrom.

These defendants show that they heretofore demanded of the other defendants (Mr. Morgan W. Jolping, John Van Evera, and Fred S. Case) named in said cause, that they join in this appeal, and duly notified each of said other defendants of the time and place where this petition would be presented, as more fully appears from the original notice and proof of service thereof, which are hereto attached and herewith presented to and filed in this Court.

Therefore, these defendants hereby appeal from the said decree to the Supreme Court of the United States for the reasons set forth in the Assignment of Errors, filed herewith, and they pray (*a*) that this appeal by them, separately from and without other defendants joining therein, be allowed, (*b*) that citation be issued as provided by law, (*c*) and that a transcript of the records, proceedings and documents upon which said decree is based, duly authenticated, be sent to the Supreme Court of the United States, sitting at
387 Washington, D. C., under and in accordance with the statutes and the rules of such Court in such case made and provided.

vs.

ALEX. J. GROESBECK, CASSIUS L. GLASGOW, CHARLES S. CUNNINGHAM, Addison A. Keiser, Morgan W. Jopling, John R. Van Evera, and Fred S. Case, Defendants and Appellants.

To Morgan W. Jopling, John R. Van Evera, and Fred S. Case:

You, and each of you, being named as defendants in the above entitled cause, are hereby notified that we, Alex. J. Groesbeck, Cassius L. Glasgow, Charles S. Cunningham and Addison A. Keiser, who are also defendants therein, propose to appeal to the Supreme Court of the United States from the judgment and decree of the above-named District Court entered therein on February 13, 1918, and that we will, on the 5th day of March, 1918, at 11 o'clock A. M., present to the Hon. Clarence W. Sessions, District Judge, at the District Court room in the Federal Building in the City of Grand Rapids, Michigan, our petition to have said appeal allowed.

And the above-named Alex. J. Groesbeck, Cassius L. Glasgow, Charles S. Cunningham and Addison A. Keiser, hereby request and demand that you, and each of you, join with them in the taking of said appeal to the Supreme Court.

Very respectfully,

ALEX. J. GROESBECK,
CASSIUS L. GLASGOW,

Former C. C. Case 4117.

DULUTH, SOUTH SHORE & ATLANTIC RAILWAY COMPANY, Plaintiff and Appellee,

vs.

CASSIUS L. GLASGOW, CHARLES S. CUNNINGHAM, ADDISON A. KEISER, Alex. J. Groesbeck, Morgan W. Jopling, John R. Van Evera, and Fred S. Case, Defendants and Appellants.

Now come the said defendants in the above entitled cause, and make and file this, their Assignment of Errors, upon which they will rely upon their prosecution of their appeal from the decree rendered therein by the said Court on February 13, 1918.

(1) That the said Court erred, in refusing to dismiss the Bill of Complaint in said cause, for the reason that the passenger rates therein complained of and fixed in Act 276 of the Public Acts of

Michigan of 1911 were and are, as applied to the said plaintiff, reasonable, sufficient and compensatory.

(2) That the said Court erred, in decreeing said Act 276 of the Public Acts of Michigan of 1911, and the passenger rates therein fixed, to be unreasonable, insufficient and uncompensatory, and in, therefore, restraining the enforcement and operation of said statute and rates as applied to the said plaintiff.

(3) That the said Court erred, in refusing to determine that the plaintiff had not made out a case entitling it to relief by
395 injunction and had not overcome the presumptions which exist in favor of the validity of a rate-fixing statute, and to dismiss the bill accordingly.

(4) That the said Court erred, in not making more specific findings and determinations as to the values of the property of the plaintiff in the aggregate, and in not finding and determining the value of the property engaged in each of the several services performed by the plaintiff.

(5) That the said Court erred, in not limiting the value of the property of the plaintiff used in its business, and required to be supported by the rates fixed by law, to the amount of the original investment therein.

(6) That the said Court erred, in using a value for the property of the plaintiff arrived at upon a so-called cost-of-reproduction theory or method, and not representing its fair present value for any of the years in controversy.

(7) That the said Court erred, in its determination, that the value of the plaintiff's property, and of the individual items thereof, was, for the years 1912 to 1917 inclusive, or for any of such years, greater than the value claimed by the defendants for the said property or for its individual items.

(8) It is claimed that the values of the several items or schedules constituting the inventory and value of the plaintiff's property were not greater than the amounts claimed as the value by the defendants, and that the Court erred wherever it selected, included or used a greater value and amount for the item or schedule than that claimed by the defendants.

396 (9) That the said Court erred, in determining and using excessive amounts and values for the property of the plaintiff used in its intrastate passenger business in Michigan for each of the years, 1912 to 1917 inclusive.

(10) That the said Court erred, in the use of an arbitrary and incorrect basis for the separation of the property of the plaintiff commonly used in its passenger and freight businesses between such businesses, and that too great an amount or value of such property was, due to the erroneous methods used, attributed to, and required to be supported by, the intrastate passenger business, and rates fixed by he statute complained of, in Michigan.

(11) That the said Court erred, in not limiting the property of the plaintiff required to be supported by its intrastate passenger business in Michigan to the proper proportion of the property actually used in that business, and in refusing to set off and to deduct a proper

proportion of the property of the plaintiff, as used in auxiliary services, such as sleeper, diner and mail and express services.

(12) That the said Court erred, in that it found and determined that the net income of the plaintiff from its intrastate passenger business was less than it in fact is or was during the years in controversy, or any of them, and less than it would have been with the statutory rates complained of in operation.

(13) That the said Court erred, in the methods used, and in the results reached, in determining the expenses arising upon, incident to, caused by, and properly attributable to, the passenger business of the plaintiff in Michigan, and particularly upon, by and to the intrastate passenger business.

397 (14) That the said Court erred, in not requiring the division of expenses between the respective services upon the plaintiff's line for the years in controversy, and each of them, to be based upon accounts and records kept by the plaintiff for the purpose of showing the cost of, and expenses properly chargeable to, each class of the service.

(15) That the said Court erred, in dividing the plaintiff's operating expenses between services, as between the freight and passenger services and between the intrastate and interstate passenger services, upon arbitrary and hypothetical formulæ or ratios, which depended solely upon opinion, which did not represent the facts, and the propriety for which was unsupported by any facts, circumstances or proofs in the cause.

(16) That the said Court erred, in attributing too great an amount of the expenses of operation to the plaintiff's passenger business in Michigan and an insufficient amount of the expenses to its freight business.

(17) That the said Court erred, in refusing and neglecting to set off to the freight service, and to thus deduct from the common expenses, a part of which were attributed to the intrastate passenger service, expenses properly attributable to the maintenance of exclusive freight trackage, thus unduly burdening the plaintiff's intrastate passenger expenses.

(18) That the said Court erred, in its methods and results, in dividing the Michigan expenses common to the plaintiff's passenger and freight businesses between such services, with the effect that a larger proportion of such common expenses was attributed to the intrastate passenger business of the plaintiff in Michigan than was properly attributable thereto or than actually arose thereon, or than was in fact caused thereby.

398 (19) That the said Court erred, in determining that the so-called "direct train cost" ratio, as ascertained and used by him, for the division of common expenses of the line of the plaintiff between its passenger and freight services, fairly or properly divided such common expenses between such services, or fairly represented the causes of such expenses, or the effects of use, or the expenses in or by the respective services.

(20) That the said Court erred, in refusing to determine that the gross ton mile ratio would more properly divide expenses of the plain-

tiff common to its freight and passenger services between those services than the ratio for such division which he used, namely, the directly-charged train costs in the respective services.

(21) That the said Court erred, in burdening the intrastate passenger operations and business of the plaintiff with the expenses and operations of other businesses, such as sleeper, diner, etc., and in not requiring each business to stand upon its own bottom and to bear its own expenses and costs, thus attributing too great an amount and proportion of expense to the intrastate passenger business of the plaintiff in Michigan.

(22) That the said Court erred, in including in the intrastate passenger business, and requiring that business and the rates therefrom to support, operations and services not a part thereof, and expenses and outlays not properly attributable thereto, by reason of not setting out and excluding expenses arising in the operations over the Mineral Range Railroad, in the operation of sleeper and diner services, in the operation of the mail and express service, and in the operation of the Mackinaw Transportation Company.

(23) That the said Court erred, in attributing too great an amount of the plaintiff's passenger expenses to its intrastate passenger
399 business in Michigan and too small an amount to its interstate passenger business.

(24) That the said Court erred, in its division of expenses between the intrastate and interstate passenger businesses, in refusing to divide that portion of the passenger expenses attributable to the business carried, or to passengers riding, in sleepers on the basis of the respective actual operations therein, as indicated by the number of passengers traveling interstate and intrastate therein, or upon some other equally proper basis.

(25) That the said Court erred, in refusing to recognize that the interstate passenger business and operations upon the plaintiff's line are largely responsible for the sleeper business and the losses therein, and that a larger part, therefore, of the sleeper business should have been assigned to the interstate passenger service.

(26) That the said Court erred, in failing and refusing to separate the operations of the plaintiff over its Western Division from the operations of the remainder of its line, thereby permitting the operations of that division to have the effect of indicating a lesser return from the intrastate passenger operations of the plaintiff than actually existed thereon.

(27) That the said Court erred, in holding that the loss or deficiency of earnings on plaintiff's line in Michigan, if any would exist with the statutory rate in operation, would be due, in whole or in part, to the intrastate passenger business, whereas such deficiency or loss, if it existed, would in fact be due to the interstate business and operations of the plaintiff, and not to the intrastate passenger business.

400 (28) That the said Court erred, in refusing, in lieu of restraining the operation of said Act 276 of the Public Acts of Michigan of 1911 and the rates therein fixed, to require the plaintiff to put such rates into effect, for the purpose of determining the actual

result of operations under the rates, and whether the claimed loss in revenue due to the decreased rates would in fact result.

(29) That the said Court erred, in assuming and deducting a mathematically-computed loss equal to the difference between the rates in force and the rates fixed upon a two-cent basis as required by law, and in allowing any loss in the absence of proof thereof and in the absence of an experimental operation of the reduced rate to determine whether its effect in operation would be to increase traffic.

(30) That the said Court erred, in refusing to hold the said plaintiff estopped to question the validity of said Act 276 of the Public Acts of Michigan of 1911, and of the rates therein fixed, by reason of the acceptances, by itself and its predecessors, of land grants with conditions attached thereto as indicated by the statutes of the State of Michigan and the Record in this cause.

(31) That each of the several assignments of error hereinbefore made and set forth is intended to apply equally to each and all of the years from 1912 to 1917, both inclusive.

Wherefore, the defendants and appellants pray that said decree be reversed, and that the said District Court for the Eastern District of Michigan be ordered to enter a decree reversing the decision of the lower court in said cause.

UNITED STATES OF AMERICA, *ss:*

To the Duluth, South Shore & Atlantic Railway Company, Greeting:

You are hereby cited and admonished to be and appear at the Supreme Court of the United States to be held at the City of Washing-

ton, in the District of Columbia, on the 3rd day of April, A. D. 1918, Pursuant to an order allowing an appeal filed and entered in the Clerk's office of the District Court of the United States for the Eastern District of Michigan, from a final decree, signed, filed and entered on the 13th day of February, 1918, in that certain suit, being Former Circuit Court Case No. 4117, in equity, wherein Alex. J. Groesbeck, Cassius L. Glasgow, Charles S. Cunningham, & Addison A. Keiser, are defendants and appellants and you are plaintiff and appellee, to show cause, if any there be, why the decree rendered against
402 the said defendants and appellants, as in said order allowing appeal mentioned, should not be corrected, and why justice should not be done to the parties in that behalf.

Witness the Honorable Clarence W. Sessions, United States District Judge for the Western District of Michigan, this 5th day of March, 1918.

C. W. SESSIONS,
U. S. District Judge, Sitting by Designation for the Eastern District of Michigan.

On behalf of the plaintiff and appellee, I hereby admit due, proper and timely service, by copy, of the within citation.

A. B. ELDREDGE,
Attorneys for Plaintiff and Appellee.

STATE OF MICHIGAN,
County of Kent, ss:

Roger I. Wykes, being first duly sworn, deposes and says that the annexed citation was served upon the plaintiff and appellee by enclosing and sealing the same in an envelope, properly addressed to the plaintiff's attorney, A. B. Eldredge, at Marquette, Michigan, and depositing the same in the United States mails at Grand Rapids, Michigan with postage fully prepaid thereon, and that the signature of plaintiff's attorney and the signature to acceptance of service on the copy of the original citation is the true, proper and correct signature of said A. B. Eldredge, known by deponent to be such.

(Signed) ROGER I. WYKES.

Subscribed and sworn to before me this 14th day of March, 1918.

ALEX. J. GROESBECK, CASSIUS L. GLASGOW, CHARLES S. CUNNINGHAM, ADDISON A. KEISER, et al., Defendants and Appellants.

STATE OF MICHIGAN,
County of Kent, ss:

Roger I. Wykes, being first duly sworn, deposes and says that he is one of the attorneys for the defendants and appellants in the above entitled cause; that the record in said cause is long and complicated,

there being upwards of ten thousand pages of testimony and several hundred exhibits; that the proper making up of a record for the United States Supreme Court involves examination of all the testimony and exhibits, and the abstracting, condensing and elimination of much testimony and many exhibits; that counsel for the respective parties have been considering the subject of the stipulation concerning the record on appeal; that the time which has elapsed since the appeal was claimed has been altogether too short to permit of the completion and docketing of such record; that, as deponent is informed and believes, not less than three months add-tional time should be granted for the docketing of this cause and the filing of the record therein with the Clerk of the United States Supreme Court.

ROGER I. WYKES,
Attorney for Defendants and Appellants.

Sworn and subscribed to before me this 2nd day of April, 1918.

Motion and Order of September 13, 1918, Extending Time for Docketing Appeal and Returning Record.

United States District Court, Eastern District of Michigan, Southern Division. In Equity.

Former C. C. Case 4117.

DULUTH, SOUTH SHORE & ATLANTIC RAILWAY COMPANY, Plaintiff and Appellee,

vs.

ALEX. J. GROESBECK, CASSIUS L. GLASGOW, CHARLES S. CUNNINGHAM, Addison A. Keiser, et al., Defendants and Appellants.

This matter coming on to be heard upon the motion of counsel for the plaintiff asking that the time allowed said counsel for plaintiff within which to present amendments to the proposed transcript of record on appeal in said cause may be extended to thirty days from September 15, 1918, the plaintiff consenting as a condition to said order that the time within which the defendants may return the record and docket the appeal may be extended for a period of sixty days from September 30, 1918, said motion being based upon the affidavit of John E. Tracy, of counsel for the plaintiff, and upon the telegraphic stipulation of Roger I. Wykes, of counsel for the defendants filed herein:

On motion of John E. Tracy, of counsel for the plaintiff, it is ordered, that the time within which plaintiff may present its amendments to the proposed record on appeal be extended to thirty days from September 15, 1918, and that the time within which the defendants may return the record and docket the appeal in said cause be extended until sixty days from September 30, 1918.

Stipulation re Exhibits, Dated Sept. 16, 1918.

United States District Court, Eastern District of Michigan, Southern Division. In Equity.

Former C. C. Case 4117.

DULUTH, SOUTH SHORE & ATLANTIC RAILWAY COMPANY, Plaintiff and Appellee,

vs.

ALEX. J. GROESBECK, CASSIUS L. GLASGOW, CHARLES S. CUNNINGHAM, Addison A. Keiser, et al., Defendants and Appellants.

In this cause, it is stipulated by the respective parties, through and by their respective counsel, as follows:

(1) As there are two of the plaintiff's exhibits marked with the number 214, it is agreed that the second of those exhibits, being "I. C. C. Classification of Operating Revenues and Operating Expenses," may be re-marked by the Clerk as Exhibit 214*a*.

(2) As two of plaintiff's exhibits were marked with the number 219, it is agreed that the second exhibit so marked, being "I. C. C. Classification of Income, Profit and Loss," may be re-marked by the Clerk as Exhibit 219*a*.

(3) The 21 sheets of assessed values and of figures appearing on the informal roll for Marquette City, found between pages 5164 and 5165 of the record, may be marked by the Clerk as Defendants' Exhibit 27*a* and filed and returned as an exhibit in this cause.

(4) Duplicates of Defendants' Exhibits 23, 24 and 25, as appearing on pages 5106, 5111 and 5117 of the record, may be filed with the Clerk, marked by him with the proper exhibit numbers, and filed and returned with the other exhibits in this cause.

(5) The Appendix to Defendants' Exhibit 72 may be filed with the Clerk, marked by him as Defendants' Exhibit 72*a*, and filed and returned as an exhibit in this cause.

414 (6) It is agreed that the printed compilations and comparison of Complainant's Exhibits 1, 1*a* and 50, and Defendants' Exhibit 15 with modifications, was prepared by the parties jointly, is what it purports to be and includes what it purports to include, and will be filed with the Clerk as a detail of the enumerated exhibits, and returned by him with the record, as an exhibit. Additional copies of this document, sufficient in number to comply with the rule, are now printed and will be furnished.

(7) The Master's report having been printed, a printed copy thereof may be filed with the Clerk, and when so filed will be returned as one of the proceedings in the cause.

(8) That Complainant's Exhibits 31, 32, 33, 34, 35, 35A, 36, 36A, 37, 38, 41, 42, 43, 44, 45, 45A, 46, 47, 47A, 48, 48A, 52, 53, 54, 55, 67, 68, 69, 70, 71, 72, 73, 74, 75, 76, 77, 78, 79, 80, 81, 82, 83, 84, 85, 86, and 87, having been printed, it is agreed that a bound volume of such exhibits, as printed, may be substituted for the originals, and that such bound volume may be returned with the original exhibits.

JOHN E. TRACY,
Of Counsel for Plaintiff.
ROGER I. WYKES,
Attorney for Defendants.

vs.

ALEX. J. GROESBECK, CASSIUS L. GLASGOW, CHARLES S. CUNNINGHAM, Addison A. Keiser, et al., Defendants and Appellants.

To A. B. Eldredge, solicitor for plaintiff:

In conformity with United States Supreme Court Rule No. 8, there is sent you, by American Express, a copy of a præcipe to be filed with the Clerk of said Court indicating the portions of the record to be incorporated into the transcript of record on the appeal of said cause.

The formal præcipe is preceded by a statement of the questions intended to be raised and insisted upon under the assignment of errors by the defendants, together with, stated in narrative form, so much of the testimony as the defendants desire incorporated into the transcript of record on appeal.

This præcipe, statement and testimony are sent you for the purposes:

(1) Of complying with said rule 8, and permitting you to designate such additional portions of the record as you desire incorporated into the transcript of record to be filed in the Supreme Court.

(2) As a basis of stipulation, if you desire to consider entering into such stipulation.

Yours, etc.,

A. J. GROESBECK,
Attorney General.

Dated October 29, 1918.

ROGER I. WYKES,
Attorney for Defendants & Appellants.
JOHN E. TRACY,
Attorney for Plaintiff & Appellee.

432 You are requested to return the bound volume of map exhibits, which contains Plaintiff's exhibits 2 to 10 inclusive, 3*a*, 4*a*, 6*a*, 10*a*, 10*b*, 15 to 17 inclusive, 15*a*, 16*a*, 19 to 24 inclusive, 66 and 93; also Defendants' exhibits 17 to 22 inclusive, 39, 42, 52 and 73.

Plaintiff's exhibits 201 to 210 inclusive are included in a single printed volume.

The printed report of the Master may be substituted for the typewritten report for use in the Celrk's transcript.

The Railroad Map of the State of Michigan, marked Exhibit A-1 for the use of the Court on the trial, should be returned with the other exhibits.

433 The parties defendant are the present (October 29, 1918) Attorney General and members of the Michigan Railroad Commission, and the various incumbents of such offices, from the in-

stitution of the proceeding to the present time, have been from time to time substituted by proper stipulations and orders.

It is hereby agreed that the pleadings above listed will be included in the transcript of record on appeal, and that the originals of the exhibits above listed (or copies thereof which have been duly substituted as originals) will be returned to the Supreme Court as the record on appeal, and we consent to an order directing the return of such exhibits as originals, subject, however, to the right to have further exhibits returned as provided by the rules in case it shall later be found that anything is inadvertently omitted.

Dated October 29, 1918.

ROGER I. WYKES,
Attorney for Defendants and Appellants.
JOHN E. TRACY,
Attorney for Plaintiff and Appellee.

It is hereby ordered that the exhibits listed above be transmitted to the Clerk of the United States Supreme Court for inspection by said Court and be considered as a part of the record on appeal and be returned to this Court upon the determination of such appeal or at such other time as may be directed by proper order.

Dated October 30", 1918.

C. W. SESSIONS,
District Judge.

1 United States District Court, Eastern District of Michigan, Southern Division. In Equity.

Former C. C. Case 4117.

DULUTH, SOUTH SHORE & ATLANTIC RAILWAY COMPANY, Plaintiff and Appellee,

vs.

ALEX. J. GROESBECK, CASSIUS L. GLASGOW, CHARLES S. CUNNINGHAM, Addison A. Keiser, et al., Defendants and Appellants.

RECORD ON APPEAL.

Statement by Defendants for the Purpose of Limiting the Record on Appeal.

(1) No question will be raised by defendants of the cost of reproduction of the property and depreciated value of that cost, as found by the Master as of June 30, 1913, in the amount of $13,945,846, except as to the items following:

(*a*) Item 1, Right of Way & Station Grounds. The Master found a cost of reproduction of $1,780,239, as against defendants' claim of $1,145,413. Defendants will contest the values for land as found by the Master for lands located in St. Ignace, Sault Ste. Marie,

2 Marquette City and Marquette County; also the values included for mineral, water and riparian rights at St. Ignace, Marquette City and County and Houghton, and the values claimed for trackage rights at Marquette and Negaunee.

(*b*) Item 3, Grading. Defendants will not contest the quantities of grading as found by the Master, but will insist that the proper price therefor was 25 cents per cubic yard.

(*c*) Item 6, Ties. Defendants will contend that for this item the price allowed by the Master was too high, and the percentage of depreciation insufficient to represent actual condition.

(*d*) Items 10, Ballast, and 11, Track Laying and Surfacing. Defendants will contend that these items should have been reduced by the Master to their depreciated condition, and that their actual condition is less than their replacement cost.

(*e*) Items 29, Engineering on Roadway and Structures, and 35, Engineering on Equipment. Defendants will insist that the item of $255,000, allowed by the Master for Engineering on Roadway and Structures is sufficient to cover the entire cost of engineering, and that the item of Engineering on Equipment is improper for

3 that reason, and for the reasons that it does not represent actual expenditure or cost to the plaintiff out of capital funds, and that the amount allowed therefor is an estimate only.

(*f*) Items 37, Contingencies; 38, Legal Expenses during Construction; 39, Organization and Administration; 40, Interest during Construction; 40, Taxes during Construction; and the item Appreciation, will be contested as improper and excessive as included in the cost of reproduction by the Master.

(*g*) Items 42, Stores and Supplies, and 43, Working Capital, will be claimed to be excessive in that the amount of $272,811 allowed by the Master for Stores and Supplies is sufficient to cover both the items, and that there is, for that and other reasons, no propriety in the allowance made for Working Capital.

(*h*) Item 34, Ferries and Steamships, will be claimed to be improperly included in plaintiff's cost of reproduction for the purposes of this case, unless the net earnings from passengers thereover are also included.

(*i*) The additions to property made after June 30, 1913, will be claimed to be as set forth in plaintiff's reports to the State

4 Railroad Commission, and as included and added in defendants' exhibits.

(*j*) This specification is not intended to admit the propriety of the cost-of-reproduction method of ascertaining the value of the property, but defendants will claim that the property is worth less, and that the plaintiff can only claim a return upon an amount less than the cost of reproduction affected by depreciation.

(*k*) So far as property has been created out of, or charged to, operating expenses, and not to capital account, the plaintiff should have shown the fact and defendants will object to the propriety of its inclusion in fixing value for rate-testing purposes.

(*l*) The south line, Marquette to Winthrop Jct., will be claimed

to have been improperly included in the cost of reproduction of the property used in the passenger business, on the theory that that line is required only because of the ore business, was purchased to retire competition, would not have been constructed for the purposes of the passenger business, and is not necessary for the proper conduct thereof.

(2) Defendants will not question the allocations of property to services, freight, passenger and common, but will claim that the methods pursued by the Master and by the District Court for dividing the common property between services—freight and passenger, and interstate and intrastate passenger—has not been established by the evidence and are improper.

5 (3) Defendants will claim that the passenger revenues over the Mackinaw Transportation Company property must be included as passenger revenues in this proceeding.

(4) Defendants will make no objection to the witness Delf's and the Master's allocations of expenses to (*a*) exclusive freight, (*b*) exclusive passenger, and (*c*) common to freight and passenger services, except that they will claim:

(*a*) That the setting off of expenses of the maintenance of exclusive freight trackage, as done by the Master and by the witness, Delf, do not constitute allocations and are improper in that insufficient amounts are set off to represent the actual cost of maintenance of such exclusive freight trackage.

(*b*) That the items of expense, Station Employees and Station Supplies and Expenses, as divided between freight, passenger and common, do not constitute allocations, and that the divisions are made on improper bases.

6 (5) All questions as to the division of common property and common expenses between freight and passenger services, and of common passenger property and expenses between interstate and intrastate passenger business, and of the common passenger expenses between passengers and baggage on the one hand and sleepers, diners, mail and express on the other hand, are reserved, and the methods of the witness, Delf, the Master and the District Court, are claimed to be unsupported by the evidence, arbitrary, general, conjectural, insufficient and improper.

(6) The losses or deficiencies in net earnings, if any, are and will be claimed to be the result of the freight, the ore, the interstate passenger, and the sleeper, diner, mail and express business, collectively or separately, and not the result of the intrastate passenger business in whole or in part.

(7) The loss or deficiency in net earnings, if any, will be claimed to result on, or to be materially contributed to by, the Western Division (Nestoria to the State Line), which, upon a proper analysis and separation of accounts, may show losses due to comparatively high maintenance costs and sparseness of traffic, and it will be claimed that, as that line was created for, and is principally engaged in, interstate service, the proofs should have been made so as to permit a separation of the income and expenses on that division, in

7 order to permit a determination of whether the loss or deficiency in net earnings, if any, was not in fact entirely due to the interstate traffic carried on over that division.

(8) The claim will be made that plaintiff has not overcome the presumptions in favor of the validity of a rate-fixing statute, and that its proofs are insufficient to establish or to furnish a basis for proper divisions of property or expenses between services, and insufficient to permit a conclusion with reasonable certainty of the cost and net return upon the intrastate passenger business carried at the statutory rates; that such proofs do not meet the requirements of the Minnesota and associated rate cases, and that too much is left to conjecture, opinion and inference, and the general judgment of witnesses, without the keeping of accounts which might and should have been kept to show with reasonable approximation the exact conditions.

(9) All questions relating to following subjects are reserved:

(*a*) Income due to unearned increment or value increases.

(*b*) Amounts included in the operating expenses of particular years, which represented expenditures for additions and betterments or to make good past depreciation or for deferred maintenance.

8 (*c*) The application and propriety of the claimed increased prices of labor, materials and construction, and equipment items, of 1917.

(*d*) The presumptions applicable to, and the certainty required by the proofs of the plaintiff in, a rate case, and the sufficiency of the proofs made.

(*e*) Whether the rates should be or should have been, given an experimental test before restrained.

(*f*) The propriety of deducting an assumed loss claimed to be due to the decreased rate, without experimental test and without proof.

(*g*) The propriety of the revenue train mile basis or any modification thereof, the gross ton mile basis, the time and ton mile basis, the direct costs basis, or any other basis, for the division of common expenses between services.

(*h*) The comparative cost of carrying passengers in interstate and intrastate services, and the comparative cost of carrying passengers in sleepers and in ordinary coaches.

(*i*) The inclusion of costs of lands for minerals, special adaptation and water and trackage rights.

(*j*) The effect of land grants and of the contributions of a portion of the property by the public.

(*k*) Original cost of investment, or commercial value, as opposed to cost of reproduction, less depreciation.

9 (*l*) The rate of return which a utility is entitled to earn.

(*m*) The exclusion of operations over, and operating expenses upon account of, the Mineral Range.

(*n*) The separation to states of property located in one state, but serving the business of the entire line, as well as the expenses incident thereto.

(10) All questions not expressly waived are intended to be reserved.

10 *Testimony Before the Special Master.*

11 On July 8, 1912.

HENRY EARLE RIGGS, a witness called by plaintiff.

Direct examination.

By Mr. Butler:

I live in Ann Arbor, Michigan. I am a Civil Engineer. I was graduated from the University of Kansas in 1886 with the degree of Bachelor of Arts, and have received the degree of Civil Engineer from the University of Michigan. In 1886, I entered the service of the Burlington & Missouri River Railway in Nebraska, on construction. In 1887, I went into the service of the Atchison, Topeka & Santa Fe Railway, on construction, and in 1888 was transferred to maintenance of way. In 1890, I was appointed Chief Engineer of the Toledo, Ann Arbor & North Michigan, now the Ann Arbor Railway, and remained in that capacity until 1896, when I formed a partnership with Mr. W. J. Sherman, Chief Engineer of the Wheeling & Lake Erie Railway, for the private practice of engineering, which partnership continued until this year, when I became Professor of Civil Engineering at the University of Michigan.

I have given special attention to the subject of the appraisal or valuation of railroads and other public service properties. In 1900, I was appointed by Prof. M. E. Cooley, appraiser of railways for the Michigan State Tax Commission, to take charge of the civil engineering section of that work, and was a principal assistant from start to finish, and on the subsequent work of Prof. Cooley in 1903, and also in 1906, for the State, I had the same position.

I have been employed in appraisal work by Spitzer & Company, bankers and bond dealers, since 1904, and have done all the work of that firm, making a number of appraisals, among which were the Consolidated Power Company of Vermont, the Jackson &

12 Battle Creek Electric Railway and Water Works plants, at San Antonio, Texas, San Angelo, Texas, Canyon City, Colorado, and a number of other water-works, gas and electric companies.

In 1910, I was employed by the Edison Sault Electric Company to make an appraisal of its physical properties at Sault Ste. Marie, in connection with the condemnation suit by the United States Government.

In 1909, I was employed by the Manhattan Trust Co. of New York, in connection with the Central of Georgia Railroad Co. income bond suits, and made a valuation of that property in the states of Georgia and Alabama.

In 1910, I was employed to make an examination of the property and the construction accounts of the Buffalo, Rochester & Pittsburgh Railway, and spent some months on that work.

I have made valuations of the street railway properties at Savan-

nah, Georgia, for the City of Savannah, in connection with a rate case, and at Atlanta, Georgia, for the Georgia Railroad Commission.

I have been employed with Prof. Henry C. Adams, on valuations of electric power properties in Michigan for the Railroad Commission, and by the Railway Commission of Georgia on the same class of property in Georgia.

For the last six years, my practice has been almost exclusively in connection with valuation work, and I have given but little attention to construction or design.

I had charge, in 1900, and in all subsequent valuations under Prof. Cooley, of the civil engineering work, the roadways, structures,
13 right of way, and all of the property and structures of the railroads, except the motive power, rolling stock, shop machinery and tools, telegraph and telephone, and I had charge of the office organization, the preparation of the reports and compilation of final figures.

The appraisal of 1900 included the property of the Duluth, South Shore and Atlantic Railway Co., and all other railways in the State. My personal connection with the 1900 work was supervisory in the main; I saw part of the mileage in the Lower Peninsula, and during that work was not personally on the lines of the Plaintiff.

The property was inspected under my direction, by experienced railway engineers, being divided, as I now recollect, into several inspection divisions, the work being done by two or three different men.

The work of 1903, under Prof. Cooley, was revision of the 1900 appraisal, in which no complete inspection of any of the properties, and no personal inspection of the Upper Peninsula property, was made. The appraisal of 1900 was taken as a basis. Certain changes in unit prices were made, to take care of the difference in cost of material and labor between 1900 and 1903, and the additions and betterments to the property as reported to the Railroad Commission were added to the former appraisal, and a considerable investigation in regard to right of way values was made in the Lower Peninsula, especially on the Michigan Central Railroad, and, based upon those investigations, quite considerable changes in real estate and right of way valuations were made as applied to the Lower Peninsula roads. No such investigations were made in the Upper Peninsula.

I have now made appraisal of the D. S. S. & A. property as of June 30, 1911, commencing with force of men about Aug. 15, 1911; procured complete inventories and inspected property, going
14 over all the lines once and parts of the line 2 or 3 times, spending 2 or 3 weeks at Marquette. There, from early Sept. until late Dec., I was engaged in necessary correspondence, checking and securing additional information to get complete data on which to base figures. Actual computations were completed before Jan. 1, 1912, and reports made to counsel, about Jan. 15, of the completed appraisal.

Book, marked Complt.'s Ex. 1, Riggs, is my appraisal of South Shore property. Sheet 1 is summary embracing value of the property of the system, except Minnesota. This shows 43 classes of items; I have followed this classification throughout. Pages 2 and 3 are a summary by items of the valuation of the property in Michigan; the

details follow to page 301. Page 4 is a mileage summary, main and bra-ch lines. Have varied Cooley schedules, introducing item 16, side tracks, which includes all items of material and labor for side tracks.

Sheet 4 gives in detail the tracks included in various schedules other than 16, showing (*a*) main track, (*b*) second track, and (*c*) branches. Page 5 shows map of D., S. S. & A., being same as first page of condensed profile. (Condensed profile marked Complt.'s Ex. 2, Riggs.)

In making appraisal, I had Complt.'s Ex. 2, Riggs, which indicated ballast and rail record. In making calculation, I used original records, checking them against the profiles. On Complt.'s Ex. 2, the track and rail record showing ballast and rails is brought to January 1, 1912. Complt.'s Ex. 2 gives maps and profiles of main line and principal branches, but not of minor branches, as branches to mining properties, short lines like Bessemer Branch, and other 1 and 2 mile lines or side tracks or minor spurs. All lines given on page 4, Complt.'s Ex. 1, as main track, but none of track listed as branches, appear on Complt.'s Ex. 2.

15 Page 6 of Complt.'s Ex. 1 is a general map of the Soo. All of the property shown here is, in effect, jointly owned by South Shore and Soo lines, each having one-half interest in the whole, through a 99 year lease. I have considered the properties at Soo, treated in appraisal as joint, irrespective of title.

Page 7, Complt.'s Ex. 1, and following pages, show detail of estimate of cost of reproduction of right of way, including expense of purchase and condemnation, abstracts, fees and commissions, a total of $2,221,923, excluding Soo Bridge right of way.

(The following is a comparison of Riggs, 1911, and Hansel, 1912, figures on schedule 1, Right of Way and Station Grounds: Hansel, value new $1,370,883; present condition 100%; present value $1,370,883; under Riggs, $851,040. Riggs value new $2,221,923; present condition 100%; present value $2,221,923.)

(Subject to correction, stipulated, Soo Union Depot Co. is a corporation, one-half its stock being owned by Soo Line (M., St. P. & S. S. M.) and one-half by plaintiff.) Each of these companies has title to certain of the terminal property at Sault Ste. Marie, and each has given to the other a 99-year lease of an undivided half of its respective property.

The first description of 13 plus acres of Soo Union Depot Co., has upon it the depot and terminal structures, and is devoted to railway terminal use.

The term "real estate" in the schedule means the bare land.

Seven or eight months previous to this appraisal, I made an appraisal of property of Electric Company, taken over by Gov-
16 ernment, at Soo. In that connection, I spent nearly three weeks at Soo, going over entire railroad line in city limits a dozen or 15 times, becoming very familiar with company property there.

I arrived at the figures in Soo, as well as for most of the property of company outside of Marquette, by placing on the different pieces of

property my own estimate of value, based on general knowledge of values at the Soo secured in connection with previous valuation and recent inspection, and affected to a considerable extent by inquiries made by me while on inspection trip as to general and specific values; with examination of the maps, taking all these things into account, I placed these values as representing my best judgment of the value of the property for railroad purposes, taking into account all of the elements of cost of acquiring, the value of the land, and the damages on account of severance. That general statement would apply to all the right of way values at Marquette, where I used a somewhat different method.

(Witness separated by descriptions and reference to page 6, Complt.'s Ex. 1, land owned by the two companies, South Shore land being 80.42 acres and Soo line land being 84.31 acres.) All riparian rights and all the property fronting on the harbor are owned by South Shore.

(Complt.'s Ex. 3, Riggs' map of Soo yard, scale 150 feet to inch.) On this Exhibit, green boundary lines show union depot property, red boundary lines show South Shore property and yellow boundary lines show Soo Company property; all are jointly used. Of Union Depot Co. property one-half was assigned to complainant. Assuming that property not now devoted to railroad use, but privately owned, I don't believe it would be possible to acquire it for less than
17 $100,000. Under some circumstances, I don't believe the property under item 2 (*a* and *b*) could be acquired today for less than $350,000 to $400,000.

Page 8, Complt.'s Ex. 1, right of way and station grounds, Sault Ste. Marie to Soo Junction, or county line, including all in Chippewa County outside Soo.

General width of right of way is 100 feet; in a few places it is 66 or 80 feet, and in a few it is 50 extra feet at small stations; in most of the counties it is 100 feet. In right of way 100 feet wide, there is approximately 12 acres to a mile.

Sault Ste. Marie to the county line, right of way uniformly 100 feet, except 1.5 miles, 150 feet, and 5 miles, 75 feet; acreage indicated, page 8, computed from right of way maps.

I am able to form an opinion as to the relation of cost of acquisition of rural or county right of way of South Shore, with acreage or land value by forties, or other convenient agricultural tracts through which it runs, assuming the railroad right of way not now used for that purpose, but to be acquired by purchase or condemnation proceedings for a railroad. I could express a relation as to the average of all country lands, outside of the territory in Marquette county affected by mineral rights, known or prospective.

I should say that in acquiring a right of way for a new railroad through these lands, assuming the present railroad to be obliterated, it would be necessary to pay as a consideration to the owners of the lands from two and one half to three times the market value of the land considered in tracts of such size as are usually sold, say 40
18 acres, which consideration would include the lands and the severance damages, and in addition to such figures it would be

necessary to add the cost of acquiring the property and looking up the title, the services and expenses of right of way agents, attorneys, abstractors, and other expenses necessarily incurred in the acquisition of the lands. In answer, I excluded Marquette county; the relation, 2.5 to 3 times, is the average relation.

In Chippewa County, the railroad line does not in any instance follow section lines, but runs angling across the sections or parallel with section lines at some distance away. On, perhaps, not over 10 or 12 miles in Michigan is the road on section or quarter section lines.

I assumed the railroad not in existence at its present place, but that the country along right of way was developed in other respects, as now. The timber has been cleared off the right of way, and it is generally grubbed; in better condition than almost any line in Upper, or upper part of Lower, Peninsulas, through similar country. I assumed 85% of main line mileage now timbered, in some form or other. The general practice in the Upper Peninsula is to place a price on land, plus estimated timber value. Land prices range, on uncleared lands, $7 or $8 per acre plus timber value, from a minimum of $10 or $12 to a maximum of $50 or $60 per acre. In making calculations, I assumed the land to be acquired as right of way in the same condition as the abutting land.

I include in appraisal the acreage price for clearing, grubbing, etc., assuming land covered with same kind of timber as adjacent land, and that it would be necessary in buying the land to pay for the timber, and also to clear and grub to construct the railroad.

19 If timber was on abutting land, I assumed it to be on right of way, also, and that it would have to be paid for. I did not take into account value of timber to railroad company for sale or use in building, as it would have no practical value; the cost of cutting, saving the timber and putting in shape for use would be too great. I know a few instances where that was attempted, but none where it was continued, because of increased expense of railroad construction. It would not be practical to make ties from tie timber on right of way.

The figure per acre set down by me is, I believe, conservative and a reasonable figure for cost of acquiring the land, taking into account all the elements and assuming it to be in the condition of abutting lands through which the line runs. I do not believe it would be possible to make a contract to purchase the right of way for the figure I have named; I think my figures are pretty low, generally.

I am familiar with appraisal of lands in 1900 state appraisal; Soo Union Depot Co. Terminal was constructed, and land for it acquired, since 1900. I appraised at Soo, to both companies, 164.31 acres at $304,042; one-half assigned to South Shore. Cooley appraised to South Shore there 84.88 acres at $118,832. My appraisal included Union Depot Co. property, and value placed was 28% more than Cooley's, which excluded that property.

(Map. Complt.'s Ex. 3, Riggs, and page 7, Ex. 1, show correction of statement of ownership, as between Soo Line and South Shore, on certain description.) This would not affect my figures, as I assigned one-half of all to each. I did not assume severance damages on terminal lands, at Soo or elsewhere, in any considerable amount; there

would be practically none at Soo, as most of the lands have been acquired by tracts, and where entire tract not acquired, remainder is left in such shape that there would be no damage.

20 The severance damages, expressed by percentage, would be generally less in cities and terminals, by reason of the smaller tracts, although in a majority of instances the entire lot or string of lots is acquired.

Mackinaw County and St. Ignace: (to extent that testimony is a duplication of Complt.'s Ex. 1, Riggs, it is not attempted to be repeated.) The right of way through town, valued at $5 per foot,—$21,000,—is made up of narrow widths, some town lots in whole or part, some narrow right of way and some wider tracts. The line runs immediately adjacent to the business houses on Main St., and in close proximity to a number of residences. I placed those values without consultation. Have been in St. Ignace 3 or 4 times since, and am satisfied that the figures are too low, and that the property would not be acquired for that figure.

I do not think $50,000, excluding gravel pit, as placed in St. Ignace, is far out of the way for a value, exclusive of severance damages, which, by reason of the way town is built along railroad, would be very high. From observation since appraisal, I am satisfied my figures are low, 50 to 100%, and that they ought to be increased.

(Complt.'s Ex. 4, Riggs, map of St. Ignace, scale 200 feet to inch.)

Page 13, Complt.'s Ex. 1, Riggs, country land, Marquette county, to mile post 150. It is practically all timbered land. Item right of way, mile post 150 to 152, less than 100 feet in width, 15.5 acres, at $50 per acre. That is right of way of varying widths; some of it is quite narrow, in quite a narrow strip or shelf of land between the bluff and the lake. The price I placed, I am satisfied, is far too low. Assuming the removal of the railroad and restoration of the land to original tracts, it would be extremely difficult to secure a right of way in this narrow strip of level land, that is

21 specially fitted for railroad purposes, and good land under cultivation; there are a number of dwelling houses all the way through it, and I am satisfied it would be extremely difficult to reproduce that few miles. From mile post 150 to where the track enters Lake St., Marquette, the right of way is located in a narrow strip varying from 200 to 400 feet wide, between the lake and hills, which is substantially level; there is no other outlet to the east of Marquette, for a railroad.

The strip gets narrower as the line goes west to the point where the strip runs out in the water front of Marquette. The M. & S. E. is also in that pass, being the only other road going east from Marquette. It is not practical for the city to be entered from the east, as by a railroad built with such grades as could be operated to take any other route except at a tremendous increase cost, over any other route.

(Complt.'s Ex. 5, Riggs, map of Marquette and vicinity, scale 2000 feet to inch.)

The three items, Complt.'s Ex. 1, page 13, Marquette county line to point where track enters Lake St., I don't believe could be reproduced under those conditions for less than $20,000 to $25,000.

(Complt.'s Ex. 6, Riggs, map of Marquette, 300 feet to inch.)

Item, water front, Burt & Ely's Add., 1,100 feet, at $35, $38,500. This strip is 50 to 80 feet wide, from water front back, lying between Lake St. and the lake.

Item, water front, inside Marquette harbor, 2,200 feet, at $75, $165,000; that is water front from opposite the end of Jackson St. to opposite the end of Washington St., on which is located ore, merchandise and coal docks of company.

22 I don't believe that, assuming the two properties not now used for railroad purposes, but vacant and unimproved, they could be acquired for less than $200,000 to $210,000. I placed my estimate at a uniform price per foot, and did not undertake to separate into small tracts; probably some of the property in the first description might be acquired for less than the sum named. I am of the opinion that part of the main water front is much more valuable, and I don't believe that the two tracts of water front taken as a whole, can be acquired for less than the figure named in my appraisal. I consider that to be the fair present value.

Item, water front, outside harbor, south of south line of Ely lot, 850 feet, at $30 per foot, $25,500.

Item 4, frontage west side of Lake St., north line of Ely lot to Jackson St., 1,000 feet, at $60 per foot, $60,000.

In my opinion, that property is worth $50 a front foot on Lake St., on account of its depth and location.

Item 5, page 13, frontage, west side of Lake St., north line of Ely lot to Baraga Ave., 1,110 feet, at $30 per foot, $33,300.

A lower valuation was placed by reason of shallower depth. The last two items were valued in Cooley appraisal at $71,740, being $34 a foot, while my aggregate is $93,300. I don't believe it could be acquired for less than I have named, but it might be worth more.

Item 6, page 13, frontage, west side of Lake St., Jackson to Mesnard, 565 feet, at $20 per foot, $11,300. The fair and reasonable value of that property, excluding improvements, is not less than $20 a front foot on the lake.

23 Item 8, page 13, 46 50-foot lots between Mesnard & Hampton streets, at $100 per lot, $4,600. I don't believe it would be possible to acquire those lots for less than $100 to $150 each, and believe their fair value not less than that.

Item 9, page 13, 12 50-foot lots west of Division, at Hampton, at $200 per lot, $2,400. Worth not less than $2400.

Item 10, page 13, 12½ 50-foot lots, Jackson to Mesnard at $400 per lot, $5000. Worth not less than $5000.

Item 11, page 13, 336 feet frontage on Lake St., Baraga Ave. to Washington St., at $50 per foot, $16,800. Worth not less than $50 per foot.

Item 12, page 13, 343 feet frontage on Front St., Baraga Ave. to

Washington St., at $450 per foot, $154,350. This covers end of Depot yard, two under crossing, and one over crossing. It is in the most valuable part of the principal business street of Marquette. I doubt whether it could be acquired for $450 per foot, if privately owned and not devoted to public use.

Item 13, page 13, 184 feet frontage on Front St., south of Baraga Ave., at $200 per foot, $36,800. Worth not less than the figure named.

Item 14, page 13, 445 feet frontage on Main St., Front to Third St. at $60 per foot, $26,700. Worth not less than the figure named.

Item 15, page 13, 14,608 square feet on Front St., 3rd. St. to
24 Washington and Main, at $2 per square foot, $29,216. Worth not less than $2 per square foot, and if privately owned I don't think it could be acquired for that sum.

Item 15*a*, page 15, 100 feet frontage on Baraga Ave., at $50 per foot, $5,000. I don't believe that it could be reproduced for that, and the actual cost to the company was far in excess of that sum.

Item 16, page 15, 150 feet frontage on Spring St., at $50 per foot, $7,500. That is an item on which there is a very large measure of severance damages; it extends diagonally across lots 15, 16 and 17 of Block 3, and takes the front off 3 lots on opposite side of street. I don't believe it could be reproduced for less than $7,500 to $10,000, and believe that its value is no less.

Item 17, page 15, 21 lots, Third St. to Fifth St., at $500 per lot, $10,500. Value not less than $10,500; probably would cost more to purchase for railroad purposes.

Item 18, page 15, 60 lots and shop grounds, Fifth St. to Park Ave., at $500 per lot, $30,000. In my opinion, worth not less than $30,000 for platting for other than railroad purposes; if railroad not there, do not believe it could be acquired for less than $40,000 to $50,000.

Item 19, page 15, unplatted lands south of Nester's Add. and west of the shops, 34 acres; estimate based on 6 lots per acre, at $150 per lot or $900 per acre, $30,000.

Item 20, page 15, south of Nester's Add. and west of the last above described tract, 36 acres, at $1,000 per acre, $36,000. Both these tracts are immediately adjacent to, and south of, a good resi-
dence part of the city; were the railroad not there, it is de-
25 sirable for platting. I placed a value of $150 per lot on 34 acres, though I am satisfied it would be worth more than that for other than railroad purposes. Its being strategically in a valley, and its proximity to shops and other property of the railroad, make it especially desirable for railroad property, and I would consider it worth more than I have placed upon it for railroad purposes.

36 acre tract is generally the same kind of land; it is higher, lays better for platting, though more remote from center of city. I stated $1,000 per acre on the basis of value for platting.

Taking both parcels in 70 acre tract, if privately owned, vacant and unimproved, taking into account its situation and considerations of strategy referred to, I don't believe it could be acquired for less than $1,200 to $1,500 an acre in the tract.

Item 21, page 15, industrial sites at end of Dead River Railroad, in North Marquette, between L. S. & I. ore docks and iron works, 151.35 acres, at $200 per acre, $30,270. The next description is the right of way leading to this.

Item 22, page 15, Dead River railroad right of way, 30 acres outside of platted part of city, at $200 per acre, $6,000. Fair value not less than $200 per acre.

Item 23, page 15, right of way, north line to city limits, 6.8 acres, at $200 per acre, $1,360. Worth not less than $200 per acre. The north line could not conveniently be placed on other land because of extremely heavy grades. If not now devoted to railroad uses, I don't believe it could be acquired for less; it might cost more.

26 Item 24, page 15, right of way, south line, Hampton St. to mile post 1, 16 acres, at $200, $3,200. This right of way runs diagonally with respect to section lines. Worth not less than $200 per acre, and I question whether it could be reproduced for that.

Item 25, page 15, right of way, north line, city limits of Marquette to limits of Negaunee, 79 acres, at $150, $11,850. Worth not less than $150 per acre; the absolute title, such as plaintiff has, I don't think could, particularly in westerly end, be acquired at any price, because affected by mineral rights. At present, all the sales reserve the right to occupy the land and right to mine. The mining results in caving down the surface, and necessitates the removal of the railway tracks and structures. If possible to support the surface, it would entail such expense that no mining company would undertake it. As ore is removed, the surface of the ground caves. In 1910, Negaunee Mining Co., desiring to remove ore under right of way of South Shore, acquired a new right of way in fee, and built 2.1 miles of new railroad for plaintiff. That was a matter of bargain, as old South Shore right of way was perpetual. This was so mining company could cave in old route.

Item 26, page 15, right of way, south line, limits of Marquette to limits of Negaunee, 96 acres, at $100 per acre, $9,600. It is in mining district, but major part not so much protected by mineral rights. The value not less than $100 per acre, and very doubtful in my opinion if it could be reproduced for that.

Item 3, page 13, water front, outside harbor, south of the south line of Ely lot, 850 feet, at $30 per foot, $25,500. Present value not less than $30 per foot, measured along streets, parallel.

27 Items 1 to 26 inclusive, within Marquette, total appraisal, $773,296. Cooley 1900 appraisal did not include all the right of way or the 151 plus acres at North Marquette as in Marquette city. His total value in Marquette was $597,777. Upon the same lands, my valuation is $732,466, exceeding his by $134,698, or approximately 22.5%.

In my opinion, land of plaintiff in Marquette city is worth not less than $800,000 to $850,000. If such land were not already devoted to railroad uses, but was vacant, privately-owned and unimproved, it could not be acquired by purchase or condemnation for less than $800,000 or $850,000.

Item 27, page 15, city of Negaunee, north line, mile post 163 to mile post 164 plus, 2,800 feet new line, 2.6 miles, near Negaunee Mine, south line, mile post 9 to mile post 12. Total acreage, 86 acres, at $2,500 per acre, $215,000. My estimate of value was based on the assumption that company had perpetual right to maintain the tracks. Fair present value not less than $215,000, or $2,500 per acre. Practically the whole of this item is in mining district, underlaid with ore mines and immediately adjacent to improved mining property. If not now in railroad use, but vacant, unoccupied and unimproved, I don't believe the land could be secured at any price. I don't believe a perpetual right of way (without the fee) could be secured at a much greater cost than the $2,500 per acre estimated.

I have made special inquiry as to amount paid for lands in vicinity of Ishpeming and Negaunee, and conditions surrounding the railroad lands there. I have been given access to information and actual cost of land acquired for railroad purposes there; have been over the territory several times, and have seen conditions that existed there on D. S. S. & A. and other railroad properties.

28 Item 28, page 15, in Negaunee City, to mile post 167 on main line, total acreage, 29 acres, at $3,500 per acre, $101,500. Fair value of this description, without mineral, not less than $3,500 per acre. If the land vacant, unoccupied and unimproved, in my opinion it would be impossible to acquire such rights as are now possessed by plaintiff for less than $110,000 to $150,000. This is all main line right of way.

Item 29, page 15, track rights in Negaunee, main line, 8,700 feet, at $5 per foot, $43,500.

Item 30, page 15, branch, 7,300 feet, at $1.50 per foot, $10,950.

Item 36, page 15, Winthrop Branch, 23 acres, at average of $300 per acre, $6,900. The acreage given is that owned on the entire branch. Most of the sidings and spurs are on lines of mining company, but most right of way on the branch itself is owned. I do not include right of way for branches, sidetracks or spurs upon the lands of others which are not owned. In sidetrack item, I have made no allowance for land upon which sidetrack is located, nor in item right of way do I include land in any case, where the track is located upon the lands of others.

(Complt.'s Ex. 8, Riggs, map of mining district, including Ishpeming and Negaunee.) This shows the location of the principal mines and railroads of other companies.

Item 37, page 15, Mary Charlotte Branch, 3.2 acres, at $100 per acre, $320. My opinion is that it is worth at least price given.

Item 38, page 15, Palmer Branch, 34.4 acres, at $100, $3,140. Worth not less than price given. If vacant and unimproved, it would be impossible, at figure I have named, to acquire rights

29 for permanent main line railroad. To acquire such rights as usual for mining spurs would cost not less than amounts named for last three items, namely, Winthrop, Mary Charlotte and Palmer branches. By rights used for mining spurs I mean the right to lay a track subject to right of mining company to order removal

on short notice. That is not the condition of these lands; most of them are ownership of right of way. There are some grants su' ject to right of owners to have tracks removed, but not many.

Item 39, page 15, Ishpeming limits to mile post 173, 168 acres, at $250 per acre, $4,200. Company has fee simple title. Value not less than $250 per acre; it would cost not less than that to acquire at present time if not used for railroad purposes and unimproved.

Item 40, page 15, mile post 173 to east end of Humboldt yard, 100.8 acres, at $75 per acre, $7,560. Worth not less than $75 to $100 per acre. That right of way would exceed in cost to purchase, if vacant, unoccupied and privately owned, $100 per acre average, on account of mineral rights, character of soil and availability for agricultural purposes. As respects section lines, the line here is irregular, paralleling section line one-eighth to one-fourth mile distant and angling across one section.

Item 41, page 15, Humboldt, 18 acres, at $500 per acre, $9,000. I estimated 18 acres in use for railroad purposes, or so affected by location of railroad as to be useless for any other purpose and necessarily a part of right of way. $500 an acre is my judgment of reasonable value, taking into account immediate proximity of mines and its use as a railway junction.

(Complt.'s Ex. 9, Riggs, map of Champion.)

30 Item 42, page 16, Humboldt to Champion, 36 acres, at $40 per acre, $1,440. The country is more or less affected by possible mineral deposits, with timber on much of it. I believe estimate of $40 per acre radically low, and that it would be impossible to reproduce this right of way for any such figure, or less than $50 to $75 per acre, which is my opinion of its value.

Item 43, page 16, Champion (including branch), 18 acres, at $350 per acre, $6,300. Value of this 18 acres affected by fact that it is immedately adjacent to mining village and that all land through there is affected by known mineral rights. This right of way is perpetual, and fair present value is not less than $350 per acre; impossible to reproduce through Champion for any such sum, but would cost considerably in excess.

Item 44, page 16, Champion to Michigamme, and Michigamme to county line, 84 acres, at $25 per acre, $2,100. Main line from mile post 186 to 193.66, except strip between mile post 192 and 193, through village of Michigamme. For a distance of 2 or 3 miles east of Michigamme, the feasible railroad routes are limited to a strip of country 600 or 800 feet wide. I am convinced the $25 per acre is too low, and that the property could not be reproduced for less than $75 to $100, on the average; that item ought to be increased to extent indicated.

Item 45, page 16, Michigamme, 8 acres, at $350 per acre, $2,800 between mile posts 192 and 193. My appraisal influenced by the fact that Michigamme is on both sides of road, which at that point is along shore of one of the most beautiful lakes in Upper Peninsula, and by mining developments at Michigamme. Because right of

way is near lake shore, it is of greater value than otherwise.
31 Worth not less than $350 per acre, and if railroad were not there, and it were vacant and unimproved, that would be fair purchase or condemnation price.

Item 46, page 16, Republic Branch, county land, 94 acres, at $25, $2,350. I am of opinion it could not be purchased at $25 per acre fixed, but do not know of extent to which lands, Humboldt to Republic, are affected by mineral values. There are mines at both ends of branch.

Item 47, page 16, in Republic village, 8 acres, at $1000 per acre, $8,000. The value is not less than $8,000, and if vacant unoccupied and unimproved, it could not be acquired by purchase or condemnation for less.

When getting the land values of country lands through the state, the severance damage varies, making the cost to the railroad of right of way lands from two to four, or more times the sales value of the land for other purposes. That was recognized in the Cooley appraisal for taxation.

In the Cooley appraisal, the multiple used was two or three times the market value for other purposes, as a basis, and to this figure was added a fixed charge of so much per acre to cover cost of acquisition and investigation of title. In my opinion, from two to four and a half times should be added. In my profession, it is a recognized practice to use such a multiplier. The general practice in valuation has been to use a multiplier varying from two to three and a half, and in Wisconsin and Minnesota these multipliers have been from two and a half to three and a half intending the figures to be approximate. The practice was first used by Professor Cooley, in 1900 valuation.

Item 55, page 15, Houghton Terminal, 12 acres, 1,550 feet, of water front, with riparian rights, ranging in depth from 150
32 to 350 feet; 1,500 feet, at $35 per foot, $52,500. The land, with the exception of a strip along the line furthest away from the water's edge, is level. There is a bench between the foot of the bluff and the lake. The question of strategy was not especially taken into account. It is the only possible entrance for a railroad line into Houghton from south. I don't know about going into Houghton from the west, along Portage Lake. The fair value, in my judgment, is not less than $35 per foot, and possible much more for any commercial purpose.

Item 56, page 16, first mile out of Houghton yard, along shore of Portage Lake, at foot of bluff, below State School of Mines, and residence district, 12.8 acres, at $2,500 per acre, $32,000. All of the land on this mile available for right of way purposes is confined to a narrow strip of which this is a part, at some places not to exceed 150 feet wide, and in no place over 250. Fair present value based on reproduction, not less than $2,500 per acre. Assuming that the land were privately owned, it could not be acquired for less than $50,000. This item and the last preceding could not be reproduced for $85,000 and possibly exceeding $110,000.

Item 29, page 15, track rights in Negaunee, main line, 8,700 feet,

at $5 per foot, $43,500. Corrected to 8,710 feet. I reached valuation of $5 a foot on theory that it would be impossible to secure a lease or grant to maintain a single track through the same territory for less. I regard track right as equivalent of independent ownership of the right to build and maintain one track.

Item 30, page 15, 7,300 feet, Teal Lake Branch, at $1.50 per foot, $10,950.

33 Item 31, page 15, track right to Milwaukee Mine, 9,120 feet, between Negaunee and Ishpeming, at $1.50 a foot, $13,680.

Item 35*a*, page 16, 1,000 feet main line, title by prescription omitted, 1.52 acres, at $3,500 per acre, $5,320. (Added in Ex. 50, Riggs.)

Item 32, page 16, south line, 12.77 acres, at $1,000 per acre, $12,770.

Item 33, page 16, city of Ishpeming, south line, in city, 38.2 acres, at $2,500 per acre, $95,500.

Item 34, page 16, north line eastern part of city, 9.6 acres, at $3,000 per acre, $28,800; western part of city, 7.7 acres, at $3,500, $26,950.

Item 35, page 16, through central part of city, narrow right of way. Track right and extra lots 5,000 lineal feet of track, estimated at $30 per track foot, $150,000.

If items 29 to 35 were privately owned, vacant and unimproved, it would be impossible to acquire rights to get such tracks and lands as the company has through that territory for less than $150,000, and possibly very much in excess of that.

(Witness produced copy of Cooley 1900 appraisal, and makes the following comparisons of land values:)

34–35

County.	Riggs.	Cooley.
Alger	$18,838	$2,539
Baraga	131,062	27,495
Chippewa	211,082	120,421
Gogebic	34,300	1,766
Houghton	133,600	46,067
Luce	24,173	6,695
Mackinaw	64,551	13,034
Marquette	1,541,927	677,848
Ontonagon	53,880	2,184
Schoolcraft	8,510	1,799
Total		$899,848

The Cooley appraisal showed 274.17 acres of farm land for plaintiff, at average of $26.16 per acre, and 4,623.2 acres barren land at $2.50 per acre, and 268 acres in cities and villages at average of $182.29 per acre. In Ishpeming and Negaunee, Cooley's value was $71,067, as against mine of over $667,000.

(Abstract from Cooley appraisal marked Complt.'s Ex. 11, Riggs.)

Schedule 3, Grading, Complt.'s Ex. 1, Riggs, page 2. The details are found on pages 33-36 of Ex. 1. This item includes clearing, grubbing, grading channels, shrinkage, overhaul, corduroy, construction, retaining walls, rip rap and sea walls, $2,879,484.

36–42 Nothing included for grading, clearing or grubbing sidetracks, which is included in item of sidetracks. Have followed I. C. C. classification of construction accounts in general, except that I have introduced new schedule, "Sidetracks," in which is included all cost of sidetracks at a price per running foot.

In computing 1911 earthwork yardage, I used as my basis the 1900 appraisal figures, checking against profiles in several instances and making full notes on inspection trip for classification of earth and other materials. The 1900 earthwork yardage arrived at by engineers inspecting the road, profiles, maps and records; this done under my direction. Computations were made, 1900, of earth yardage as taken from profiles. I have found these computations substantially correct. In 1900, there were no allowances in addition to bare profile quantities. Since 1900, there have been changes in mileage.

An increase of yardage is made due to bridges, trestles and open cattle guards filled and small work widening fills. In Cooley appraisal the Republic Branch was omitted from grading. Cooley appraisal makes no allowance for solid rock excavation, Michigamme to state line, and not sufficient allowance for rock, Michigamme to Marquette.

43 Page 4 of Complt.'s Ex. 1 shows the mileage taken into account in grading, on pages 33-36. I accepted the total yardage of Cooley appraisal as starting point; there, there was no allowances made in addition to profile quantities for shrinkage, for which it is customary to add 10% to care for settlement of fills. I added 10% for shrinkage, to take care of settlement and error due to the absence of actual cross-section notes and use of profile measurements.

There are only two classifications in Cooley appraisal, solid rock and earth. I have divided loose rock and hard pan ,and re-divided Cooley quantities among the four. Shrinkage added is 10% of all yardage; that is, yardage of pay earth, and not combined yardage of all cuts and fills. Overhaul added; the free haul distance adopted by me was 600 feet; the customary distance varies from 500 to 700 feet.

Cooley appraisal allowed nothing in grading for overhaul, shrinkage, grading crossings and station grounds, etc., probably because of short time for work of appraisal; they were included for some roads. Considering the fact that Cooley appraisal was done in three months, it was a wonderful piece of work, but in many instances it contains omissions. I arrived at figures for overhaul, grading crossings, etc., by the use of a percentage, varying from 6 to 9, of the earth yardage, fixed by inspection and judgment.

In Cooley apraisal, I do find four items of loose rock; the Cooley appraisal included the jointly-owned mine tracks in Republic yards.

The yardage totals are given as follows:

14

District.	Yards.	Average per mile.
Soo to Marquette	2,063,010	13,410
Soo Junction to St. Ignace	449,722	10,466
Marquette to Houghton	2,732,596	21,640
Nestoria to state line	1,880,218	18,130
	7,125,546	16,690

The average of 16,690 yards would be equivalent to a 16 foot roadbed, 1.5 to 1 slope, level cross-section, 4 feet high. The yardage for embankment of various heights would be, 4 feet, 17,160 yards, 6 feet, 29,300 yards, and 8 feet, 44,000 yards, per mile. Generally, the embankments are full width; in many cases, especially in marshy or low ground, the banks are wider than standard, 16 feet. Cuts are also wider than standard, due to the fact that they have assumed the angle of repose and have been cleaned out, as the material sloughed down. Generally, the fills have been replenished and brought up to full standard width and have assumed, in the main, the angle of repose and become covered with a growth of grass.

From my observation, I have been able to form an opinion as to whether or not on the average the yardage in the road is as much as stated. This is independent of computations. My opinion is that a re-measurement and re-cross-section of the road would show actual yardage per mile to be:

Soo to Marquette	14,000 to 15,000 yards.
Soo Junction to St. Ignace	12,000 yards.
Marquette to Houghton	25,000 yards.
Nestoria to state line	20,000 yards.

On an old road like this, it is not possible by inspection of the ground to ascertain the number of yards moved and put into the banks; at a number of points, there are soft ground and sink
45 holes, or swamps, where the earth would settle and would not be discernable or capable of measurement. Approximately 25 to 28 miles east of Marquette show evidence of having been corduroyed, which would naturally and normally settle. The records of plaintiff would not show what has been done by way of fills since road was built. The records are very incomplete as to work done between original construction and 1895, in putting on earth, raising fills or widening banks. The original construction records are on the profiles, which would not show the amounts of yardage paid for.

The unit price for grading was, in my judgment, fair and reasonable, and it would fairly and reasonably cost that amount to do the work at the present time, or last year. Cooley prices in 1900 were, 25¢ per cubic yard for earth grading, 60¢ for loose rock, and $1.25 for solid rock. Wisconsin appraisal of 1908 uses the same figures as Cooley appraisal. Prices from other appraisals are as follows:

Appraisal.	Earth.	Loose rock.	Solid rock.	Hard pan.
Minnesota Appraisal, by Morgan.....	27c.	50c.	$1.20	
Cooley Appraisal, 1900	25c.	60c.	1.25	
State of Washington Railway Appraisal, by Gillette	25c.	50c.	1.10	42c.
Wisconsin Appraisal, 1908.....	25c.	60c.		
Northern Pacific Appraisal, Minesota, by Darling	28c.	50c.	1.10	42c.
Great Northern, by Hogeland.....	27.75c. to 31.5c.	55c.	1.25	45c.
D. S. S. & A. Construction, Branch and Sidetrack (1910)	22c. & 40c.	75c.	1.35	50c.

The contract prices would be very materially affected by the local conditions surrounding the work, the ease with which a company could secure teams and men, whether the contractor who had
46 taken the work would have to ship his equipment a long way from settlements and board them himself. In Wisconsin, Michigan and Minnesota the prices would be about the same. In Wisconsin and Iowa, it would be easier to secure men; the element of shipment of the entire force a long distance to do the work does not come into the computation in Iowa, as in Michigan or Wisconsin, along South Shore. The local labor supply ought not to be a great factor in these states, except in team work; the local supply of teams would affect the conditions of railroad construction.

There has been a general increase in labor prices of about 15% between 1900 and 1911, and an increase in materials ranging from 5% to 100% on timber of various kinds; 1911 and 1912 prices are somewhat lower than 1909 and 1910, but the general tendency is upward. When prices went down in 1909 and 1910, they did not go as low as they had been in previous years. The inventory of schedule 3 is, according to my best opinion and judgment, true, correct, and as complete as I can make it, and the cost of reproduction as of June 30, 1911, or 1912, would be not less than $2,879,484.

Failure to depreciate earthwork and grading is due to the fact that the work is worth as much as cost to produce, new, a like structure. The cuts and fills on this road are in a condition today of absolute stability due to settlement, due to the fact that all of the erosion by water, and various other forms of sloughing and settlement that will take place, have taken place, and that many, or I may say most, of the embankments and slopes of cuts have become sodded over. The roadbed of plaintiff is in very much better condition today than a new, green, unseasoned roadbed would be. There will be no settlement, and the expense of maintenance is very materially less on an old, well seasoned roadbed that has become thoroughly
47 adapted to conditions of drainage that are formed or created by the construction of roadbed. In my judgment, the cost of track maintenance would be increased, on an average, by the addition of two or more men per section for the first six or seven years, to take care of the work of cleaning out of cuts and of replacing earth around embankments that had sunk down or been washed away.

I used the prices and information I secured in the offices here as

an aid in arriving at fair unit prices to apply to a general reproduction estimate. In many instances, prices paid for small quantities of material were considerably in excess of my unit prices; this is true, also, in the matter of labor contracts for grading, rock and loose rock.

Schedule 6, Ties, Complt.'s Ex. 1, Riggs, pages 144 to 146. The average life of ties in this territory is: Cedar, 10 to 12 or 13 years, tamarack, 9 to 10 years, hemlock, 8 to 9 years, and oak, 8 to 10 years. Some years, the conditions of work will be such on the road that renewals that can be left are allowed to run for a year, and renewals the following year will be heavy. Sometimes this deferred maintenance will run two or three years, with only necessary renewals, and then larger renewals will be made. Generally speaking, tie renewals are above normal from year to year, and from one-eighth to one-tenth of the main line ties will be renewed each year, depending on the kind of ties, and the local conditions.

I found that the company had made tie purchases for 11 years ending June 30, 1911, as follows: 279,316 cedar, 921,160 hemlock, 341,649 tamarack, 111 oak, 582, pine, 1,688 ash and 70,846 culls.

48 I have applied a present condition of 60%, throughout, as being representative of the present condition of the ties, as compared with new ties.

Ballast, including cost of material, loading, transportation, unloading and placing in track of ballast for main line, $646,898; present physical value, the same amount.

Q. While we are on the subject, does ballast depreciate in condition?

A. If a road is ballasted and no further work of ballasting is done upon it for many years, I would answer your question yes, but if, as is the usual railroad practice, the ballast is renewed from time to time, additional ballast being placed upon it, the amount of ballast under the track becomes very largely increased, the drainage improves from year to year, and the ballast, as far as the condition is concerned, remains at substantially 100% condition, and in my opinion this item should not be depreciated in the case of a road which is keeping up with the renewals of ballast and the addition to the quantity of ballast.

The fact is that the road is a well ballasted road; between Marquette and the Soo and St. Ignace, Marquette and Houghton, and from Nestoria to the state line, there is a large amount of ballast and considerable recent work has been done, but a year ago there was a considerable mileage between Nestoria and the state line that was in need of additional ballast.

I should call the road a well ballasted road wherever gravel and sand has been applied; at other points, I have used the price of sand ballast.

48*a* In my opinion, the ballast that is now on the road in Michigan could not be reproduced for less than $646,898, and that it is worth today that sum of money.

I do not believe it would be possible to reproduce the ballast that is on the road today, as it has been placed piece-meal, with most of the material loaded by hand and not by steam shovel, for anything like the figure that I have estimated.

The item of track laying and surfacing has not been depreciated at all. I regarded the same as a labor item. I have treated this item and the ballast item in the matter of depreciation exactly upon the basis of Mr. Cooley in 1900, in that no depreciation was made, upon the ground that they were a cause of creating property, and as long as the property was in use and as long as large sums of money were annually spent for the maintaining of those elements—in the highest condition of efficiency, was the word I was hunting for—that it is not proper to figure a depreciation.

The Mackinaw Transportation Co., listed under schedule 34, Ferries and Steamships, is a corporation engaged in running a car ferry line between St. Ignace and Mackinaw City. One-third of the stock of this corporation is owned by the plaintiff and the other two-thirds by the Michigan Central and the Grand Rapids & Indiana. The company is not operated for profit, and each company pays an equal proportion of all the expenses connected with its operation. Its property consists of certain ferry boats, which are listed in the schedule, and one-third of their value is assigned to plaintiff.

48*b* Engineering on roadway and structures, including salaries, expenses, supplies and transportation of engineers, inspectors and architects, and fees for inspection of material and machinery, fixed at 4% of items 1 to 28 inclusive; 4% on $12,187,742 equals $487,510. Fair present reproduction value and the present physical value are the same.

There has been no allowance elsewhere covering cost of making plans, inspection or superintendence on any of the foregoing schedules. This work includes preliminary surveys, location of line, engineering on construction, and incidental inspection, plans, superintendence of construction, and inspection of bridges and other structures. This is item 1 in I. C. C. classification.

49 It is customary, and has been for many years, to include in all estimates of cost for new construction a percentage allowance to cover the item of engineering, and it has been customary and usual in appraisal practice to make an allowance for engineering based upon a percentage of the roadway and structures items substantially in every appraisal, the same items that I have included in this group, in arriving at this percentage.

In Cooley appraisal, the same percentage, applied to the same items, was used, except item 27, Electric Plants, new since Cooley appraisal. The 4% is an average; it might be very little on some items, and higher than 4% on others. The average was arrived at by making a careful study of the actual engineering percentages of work done under me and by me for the last 12 and 15 years, and comparing my own experience with the experience of other engineers, and by the use of a figure which I believe to be a fairly conservative one, to represent this expenditure.

I believe this is as accurate a way of getting at proper charge for engineering as to take each item separately at its own proper percentage, as it would be almost impossible to keep separate accounts of, or to compute a proper allowance for, engineering. For certain items—for example, in the roadbed item—there is a large amount of engineering that is not directly assignable to any one of the elements that go to make up that item; there is no way to accurately ascertain the engineering charge on any particular item, 1 to 28.

You must find out what the engineering of a railroad would amount to, and that includes not only the design and superintendence of your buildings and your bridges, but it also includes very large expenditures for preliminary surveys and for location surveys, and for soundings and borings and other work to determine the area of water ways and the character of foundations to be used; that cannot be definitely assigned to any of the items making up the cost of the road. Ordinary engineering accounts are kept as engineer-
50 ing, and all of the elements on engineering expense are kept in one general account, and not assigned to any specific structure.

The 4% is an estimate based upon the comparison of actual engineering percentages in a large number of cases. It represents my opinion; that figure represents the concensus of opinion of the engineering profession of the percentage as to the fair and reasonable allowance. The manner of the application of it is in accordance with engineering practice. The amount of the percentage varies considerably in construction estimates based upon the character of the construction that is about to be undertaken.

There is a decided concensus of opinion as to the propriety of using 4% on properties of this kind in valuation work, applied to the items to which I have applied this. The percentages used in construction estimates on railroad work vary from 4% to 7.5%, averaging 5%.

Engineering on equipment, including all engineering salaries and expenses connected with the purchase or construction of equipment, fixed at two per cent of items 30 to 34 inclusive; 2% of $2,946,193 equals a fair reproduction value of $58,924; present physical value the same.

The item did not appear in any of the Cooley appraisal in Michigan. It was added because it represents an expense to the railroad in connection with the inspection, breaking in and testing of equipment. The 2% was placed after conference with Messrs. Saddler and Anderson and based upon their experience, and information
51 secured by Mr. Anderson and myself as to the value and cost of such work in connection with other railroads. In work in New York, last year, we were able to determine the exact cost of that item, as far as locomotives were concerned.

There, the cost of preliminary engineering, specifications, inspection and cost of breaking in ran over 2%—almost 3%. My own experience permits me to state with positiveness only in the matter of steam shovel and other construction equipment, where I have known the cost to run from 1.5% to 3.5%. In such equipment, it is neces-

sary to pay for the time and expense of a man sent by the manufacturing company to assemble, test, put the machine in order and give it a trial run, which is additional to price paid by purchaser.

Locomotives are not fully assembled, and considerable work, in the way of assembling the various fittings, must be done; it is the practice on railroads to break in locomotives, taking, sometimes, several weeks. On freight cars, it would be less than on items of machinery. On passenger equipment, it would be in part due to minor equipment purchased for cars. On work equipment, my percentage is fair to represent bona fide expense, and would necessarily be expended in reproduction.

The item of contingencies is one that is added in all cases of valuation, to cover those elements of cost of construction that are not disclosed by the inventory of the property, and those elements that are due to weather, strike and other causes that go to increase
52 the cost of construction or add to the unit prices that have been used in making up the appraisal estimate.

My percentage averages 7.9%. This item is, and has been for many years, customary in construction work, in the engineering profession. On ordinary construction work, involving all classes of road equipment and bridge work, percentages vary from 5% to 15%, and more, averaging fully 10% on all items. Engineering practices vary as to exactly how this should be added; some prefer to add a percentage to each item, varying from 5% to 20%, and some prefer to add an average percentage to the entire estimate.

Where percentage is applied to each item, there should be a general smaller percentage applied to undertaking as a whole, to cover elements of cost not covered in specific items. Contingency item is to cover unforeseen things or errors in inventory, and includes casualties, personal injuries, and loss by fire, flood and cyclone. In a property in existence for a number of years, it is difficult to procure accurate inventories, especially of masonry and concrete, yardage of grading, and other elements that go to make the completed property. The percentage is added, on the assumption that the estimate is always under. In practically every estimate of this sort, the serious errors have been errors of omission.

It might be possible to over-estimate, but in an estimate based upon profile quantities, as this is, the almost absolute certainty is that the error is of under-valuation, rather than an over-estimate. The profile fails to show swamp land, where settlement has taken place and additional earth has been hauled in, or earth for filling sink holes or swamps, or earth hauled in to widen embankments, or where cuts have been taken out by steam shovel work and material used
53 elsewhere. My contingency percentage is lower than in all Cooley appraisals, where 10% was applied to all items, including the overhead charges.

In every appraisal of railroad properties, a percentage has been included for contingencies, the amount of which has not been uniform. I have had frequent opportunity to observe the propriety of the percentage by comparison with actual results of work for which I made estimates. It has been my practice to allow 10% for contin-

gencies in all estimates for new work. I have never been employed on work where the element of contingency in some form did not enter into and affect the cost to such an extent as to wholly or largely justify the percentage used by me, of 10%.

In general, the problem of estimating reproduction cost is more difficult than estimating the cost of new construction of a standard property, as the estimate for the new property is based upon complete surveys and specifications, etc., and the contingencies should be limited to elements of unseen construction, such as clay soil, rock, hard pan, quick sand, swamps, sink holes and weather contingencies, and not upon the omission of things to be done, while in the case of an old property all these things enter in; the property has been built so many years that perfect history of construction cannot be secured, and many things are not found that were encountered in building the property.

In my opinion, a contingency allowance is proper and necessary; the amounts added are reasonable, and I believe that, if it were possible to determine the exact history of this property, it would be found that all, or substantially all, of the amounts named for reproduction cost of contingencies have actually been incurred in the way
54 of contingent expense. Without attempting to make a complete check of the property, I have noted the following items emitted from my appraisal:

(*a*) Riprapping along shore of Marquette harbor, which cost the company thousands of dollars.

(*b*) Riprapping along shore of Lake Michigan. (Hansel made a careful survey of riprap, and found a total on the line of $4,110.)

(*c*) Bridge crossing warnings or ticklers entirely overlooked, which would run into several hundred dollars.

(*d*) In some bridge estimates, masonry was based on pedestals shown upon plans; by photographs of the bridge received since the computation was finished, it is shown that there are a couple of hundred feet of masonry retaining wall connecting these pedestals, built as shore protection, and in other instances items disclosed by the photographs have been overlooked.

I believe a careful checking of all these schedules would disclose hundreds of items that might, or should, have been included in inventory.

Legal expenses during construction fixed at one-half of one per cent of items 1 to 37 inclusive; one-half of one per cent of items 1 to 37 equals $85,122, for the fair present reproduction value and present physical value.

On construction work I have been connected with, the element of legal expenses incurred throughout. Services of an attorney
55 are required pretty constantly during construction of roadbed across lands acquired; controversies with contractors are frequent, as are claims for damages to property of adjacent owners, by setting back of water, building new embankments, and fire, and on account of injuries to persons during construction. I have never seen extensive operations carried on where services of an attorney

were not almost as constantly in demand as engineers, though not in so large a force.

Engineers rarely include this item in detailed estimates, as it is an overhead charge, placed by general officers. It is a custom in valuation work. Legal expenses are rarely under direction of engineer. It has been customary, in all of the state appraisals and appraisals for railroad companies, to allow for legal services by a separate item, or to include a percentage for legal services with engineering. The item is usually expressed in a percentage of other items, as I have done, and a percentage of .5% has been most generally adopted in valuation work during the past 10 years; this was the percentage allowed by Michigan appraisal of 1900, applied, I think, though I am not certain, to substantially the same items—1 to 37 inclusive.

Organization, administration and general expenses during construction fixed at 2% of items 1 to 37 inclusive, $340,490.

This item is inserted to cover those expenses of construction which must necessarily be incurred in connection with the incorporation, organization, preliminary financing, and the administration of the property during construction period, and the general expense
56 covering clerical help, accounting forces, and other official and clerical organization, office rental, supplies and expenses incurred during the construction period and not otherwise provided for.

Nothing is included for discount, bonus or commissions, etc., but I have included a figure which I believe to be reasonable, to cover expenses that would necessarily and properly be incurred in the construction of this railroad. I don't know of a single instance where items of legal expense and organization, administration and general expense have not been incurred in large amount, and I do not know of instances where these items exceed the percentages named by me, very materially.

In Cooley appraisal of 1900, 2% was allowed for organization, administration and general expenses. Percentage for this item is customary in appraisal of railroad properties, and every such appraisal made by state or railroad authorities has included this item, and used from 1.5% to 3.5%, usually 2% or 2.5%.

Item 37 is a physical allowance. Items 38 to 40 are overhead charges, to which are sometimes added discount, commissions, general contractors' profit, etc., all of which I have excluded as not being proper in an appraisal of this kind.

Interest during construction fixed at 7.5% of items 1 to 39 inclusive, $1,308,757 set down in both the reproduction column and the present physical value column.

57 This is an allowance to cover needed expenditures for interest on capital invested in railroad during construction period and to the time operation of the property commences. To get at the amount, we must determine the time required to construct the property, and the rate of interest to be paid. I assume a rate of 5%, and that it would require not less than three years from commencement of operations to completion of the property, which would be 15%. I assumed interest on the whole amount for one-half the time, on the

idea that one-half of it would be idle for three years, the investment being made through that period.

I do not believe that it would be possible to build any portion of this particular property and put it in operation in advance of the whole property, assuming the reproduction of the entire property new, or that it would be profitable, or that it would in any way materially reduce the interest item. The cost of operation before completion would not only consume the revenue, but would seriously interfere with the construction. The bulk of the equipment would come on to the property in the last few months, while the major part of permanent way would be built in early part of the period. It is fair to assume that, on the average, money would be in use 1.5 years before the road is in operation.

In order to build the line in three years, it would be necessary to start simultaneously at a number of points and carry on the grading and bridging on substantially the whole line. My three years' estimate applies to the Michigan property alone. The South Shore line from Nestoria to Iron River took two years and eleven months to complete, and it took a year to extend the line from there to the west
end. Three years is as short a time as possible in which to
58 build South Shore in Michigan, with structures, ore docks
and terminals; construction of ore docks would take a year, or more.

In Cooley appraisal of 1900, 3% was allowed for interest during construction, with regard to mileage of road or character of construction; the same percentage was used in his subsequent appraisal, and in Wisconsin. The 3% was on the assumption that all the roads in Michigan would be built in short sections, requiring one year for construction and completion, at a 6% rate.

I am familiar with conditions governing the financing of railroad properties. In my judgment, it would be practically impossible for a new company, or any company not thoroughly established, and with the highest credit, to secure money for new construction at 5%. I believe it would be impossible for South Shore to secure the money for less than 6%, and then only upon selling at 20% discount. In recent years, most railroad engineers have included a percentage for interest, though previous to last few years it was not considered within engineers' province. The general practice of taking the full interest rate for half the period is the general method as practiced by myself, and, so far as I have seen it, in estimates of other engineers.

Stores and supplies, $277,904, to be apportioned, 82.5% to Michigan and 17.5% to Wisconsin.

This is the total of inventory on Auditor's books, June 30, 1911.
The totals for this item, as appearing on June 30. for the years
59 named, are: 1900, $253,052.46, 1901, $195,708.69, 1902,
$198,013.48, 1903, $225,196.83, 1904, $241,355.18, 1905, $247,443.24, 1906, $356,804.85, 1907, $285,921.00, 1908, $371,045.54, 1909, $270,812.32, 1910 $285,043.39, and 1911, $277,904.01. The apportionment between states is on a track mileage basis, being 82.5% Michigan and 17.5% Wisconsin.

Working capital:

This includes money and bills receivable. I accepted Mr. Delf's statement, that $240,000 was a fair average, and less than the average for the year. In my opinion, the amount is reasonable, being a little below what I would expect to find and less than I have found in roads of similar mileage in other localities.

In my opinion, the fair present reproduction value of the property of the D. S. S. & A. in Michigan, including the car ferry, Chief Wawatam, and including stores and supplies and working capital, is not less than $19,199,105, and the present physical value is $16,-132,083.

In placing land values, I have assumed that the company would reproduce the title now owned by it; with but few exceptions, it owns the land in fee simple. I think I pointed out the cases, except in case of right of way, where there is considerable right of way occupied, fenced and cleared, to which I can find no title by deed; this is between 300 and 400 acres, out of a total of 6,000. I make no difference in estimating the value of these and other lands. My
60 valuation rests almost entirely upon the idea that the estate of the company is in fee simple, or its equivalent, with the exception of the few cases noted, mainly in Marquette County.

In mineral districts, I attributed nothing as an element of value to the fact that mineral was in the land, except that the cost of securing lands in some parts of the territory would be made more difficult and expensive. I have not included any value under the land, or any possibility of value, by reason of use or sale of mineral rights. The fee simple title which I value is the perpetual right to maintain the track and right of way, and use the land for railroad purposes.

It was the perpetual right to use, with the reversionary clause in case of abandonment of use, that I valued. In mining districts, where right of company is less than perpetual, and terminable upon conditions, I think that, in all such cases where I have placed a value, I have taken those facts into consideration, and they are reflected in the value placed upon the land. In certain instances, in Marquette County, I valued simply the right to maintain a single track.

(Complt.'s Ex. 12, Riggs, a comparative summary, showing total, by schedules, of Michigan appraisals of 1900 and 1905 and Riggs' appraisal of 1911.) There is a slightly different definition of some of the items, especially the trackage item, from which I separated 16, side tracks; the aggregates are the same. (Stipulation that figures of former appraisals may be used, subject to correction from original source.)

(Complt.'s Exhibits 1 to 13 inclusive offered in evidence, subject to objection detailed.)

61 (Complt.'s Ex. 14, Riggs, blue print pages, being index to rail and ballast record of tracks, and a sample page of rail and ballast record, Ex. 10, all introduced in evidence.)

(Complt.'s Ex. 15, Riggs, a blue print map of tracks and property of company from Negaunee east limits to Ishpeming west limits, scale 400 feet to inch.) This map heretofore referred to in my testimony.

My appraisal includes only physical properties with percentages added to cover overhead charges on elements of cost not capable of inventory, the expense of which is a part of creating the physical property. No allowance is made for good will or going concern value. No general contractor's profit, discount, cost financing, commissions beyond 2% for organization, administration and general expense, are included.

I did not attempt, in fixing the depreciation, to express any relation by that depreciation figure between the operating efficiency of the property as it is now and the operating efficiency of a new property. The figure rather represents the physical depreciation or loss of life, which should be in every case represented by a reserve created to take care of the renewals of the property, or to replace various units of the property when they come to the end of their life and have to be replaced by new units. Much of the property that appears with heavy depreciation in these figures is as efficient and capable of doing the same service, and is doing the same service, that new property would do.

I considered the property, taking into account its character, the service which it renders, its construction, and the country operated through, as a highly efficient and well maintained property of its class. It is well suited to render the service demanded of a railroad in its locality. While certain of the elements are depreciated,
62 such as ties, at 60%, they are as valuable to the public as though in 100% condition. What was said as to ties applies to other elements of the property which depreciate.

In my opinion, the property, as it exists today, as a unit, is more valuable as an operating tool than it would be if it were wholly new, by reason of the fact that on a new property the roadbed would be green, would settle, that the other elements of physical property all have to be tested out and large expenditures made upon them to remedy defects and bring them to a condition of operating perfection or safety, and all of the machinery and equipment would have to be broken in and would have to have considerable sums expended upon it before it would be in the condition of operating efficiency that the property is in today.

The operating expenses, exclusive of the elements of renewal, as they apply to the maintenance account, would be more in the case of a new property than in the case of this old one. This property is renewing the various elements that enter into it from year to year, and is expending new, each year, considerable sums of money in such renewals that would not take place in the case of a brand new property until after the end of the third or fourth or fifth year.

I would term a property as new during the first three or four years of its life, though the adjustment of buildings and breaking in of the equipment would probably come in less time, while solidification and settlement of embankments and fills, adjustments of drainage, and proper size of waterway openings, would take a longer
63 time.

I have made no allowance for appreciation of roadbed, embankments, bridges or structures, and have not included any-

thing for solidification or adaptation. Except as appreciation is reflected in unit prices of today, applied to structures built when work cost less, there is no element of appreciation in the appraisal.

Q. That leads us to the question of just what conceptions were the basis of your estimate of the reproduction new cost of this property?

A. I have conceived the elimination of this property and its reproduction new as of the past year, when applied to prices, assuming all other lines of communication now existing and all surrounding conditions remaining as they are at the present time. In other words, I have not taken into account hauling of materials through the woods for a distance of many miles, nor have I taken into account the extra cost, for instance, of pile driving by reason of the use of team drivers, horse drivers, but I have conceived that all other means of rail transportation and existing means of water transportation remained.

I include in my right of way estimate 15% for attorneys' fees and incidentals. I have never been able to estimate right of way high enough, except once, when I made a straight estimate of $5,000 an acre, at Negaunee; there, I was a little high. I have had some right of way work where I had no attorney's fees, and others where they were 50%.

On August 20, 1912.

RIGGS.

Direct examination resumed.

By Mr. Butler:

Since giving direct testimony, I have examined the transcript and been over the line of the road, accompanying engineers of the State on their inspection trip. I have made examinations of maps of one or two towns, and believe my testimony and exhibits should be corrected.

64 Complt.'s Ex. 1, Riggs, page 16, L'Anse, acreage previously stated, 45.2, at $1,500 per acre, value $67,800; this should be reduced to 32.1 acres, with value of $48,150.

Complt.'s Ex. 1, Riggs, page 17, Thomaston station grounds, previously included 60 acres, at $200 per acre, being the acreage of Cooley appraisal; on further inspection, I find actual acreage 20.5 acres, which would reduce value from $12,000 to $4,100.

Complt.'s Ex. 1, Riggs, page 208, wooden turntable at Republic, 50 foot, built in 1900, cost of reproduction, $2,750, and present value, $2,062; due to fact that this is an obsolete and inexpensive type of turntable, reproduction cost *now* reduced to $400, and present value to $200.

Complt.'s Ex. 1, Riggs, page 286, International Bridge, cost of reproduction, $314,864, and present value, $291,427; one-third interest was assigned to South Shore, when it should have been one-quarter interest, and South Shore proportion should be reduced: Cost of reproduction, from $104,954 to $97,142; present value, from

$78,716 to $72,857. Portage Ave. bridge, at Soo, I have assigned to Terminal Co., though bridge record of South Shore shows it as South Shore bridge. (Mr. Eldredge states this bridge to be South Shore ownership and covered by lease of one-half interest to Soo Line, stating one-half, instead of one-third, to go to South Shore.) In my appraisal, I attributed one-third of Portage Ave. bridge to South Shore; if owned by Terminal Company, one-fourth should be so distributed; if owned by South Shore, one-half should be attributed to it.

By going over the road, checking the valuation, item by item, it would be possible to find a considerable number of items that might be increased by placing a higher percentage of condition,
65 and perhaps an equal number decreased for the same reason; but, generally speaking, I have made no glaring errors, except those I have called attention to, and see no reason for making further corrections. I have recently made a trip over the entire mileage of the road.

At Sidnaw, it is possible my judgment has been somewhat affected by general character and upkeep of plaintiff's property and buildings, and that I have placed too high a value; I have no objection to cutting the value down to $750 per acre, though I question whether the property could be reproduced for that.

On real estate, I have based my valuation almost wholly on my personal judgment, based upon experience in purchases of railway lands, after having secured all available information and investigation of cost of other railway purchases in this and other states, in connection with valuation work. The information acquired consists, to small extent, of investigation of records and, to considerable extent, of sales for other purposes and the actual consideration paid by other railways for lands in the general vicinity, but the right of way values represent my opinion of probably cost of reproduction of these lands for railroad purposes, assuming South Shore did not exist.

The Master: In making up that judgment, you first determine what the land would be worth for other purposes, and then add what it would cost to acquire it for railroad purposes, is that correct?

A. Not altogether, for the reason that in many instances, particularly in the cities, the element of damages, the element of the cost of acquisition, I have aimed to include in this figure a figure
66 that would cover not only the increased value of the land over other land by reason of its railroad use, but to cover whatever there was in the way of severance damages, and of the cost of acquisition, which in ordinary country lands is a very considerable percentage of the total cost.

The Master: By cost of acquisition, you mean what is added to the value of the land for other purposes?

A. No, by cost of acquisition, I mean the cost to the railway company of acquiring the land, including the making of the abstract (it is usual and customary for railroad companies to have an abstract of the properties made, for their own use, before starting negotiations) and, in addition, the amounts paid to right of way men,

real estate men, employees of the company, or others, who negotiate and actually purchase the land. There should be a separation into the consideration paid for the land and the second element cost of acquisition. In the first element, the consideration paid for the land will range from two and a half to three, or even as high as five or six times the value of the land for other purposes.

RIGGS:

Cross-examination.

By Mr. Wykes:

In fixing land values, I have taken into account the fact that there is invariably an excess cost of lands purchased for railroad purposes over lands purchased in ordinary commercial tracts for farming or other general purposes.

Q. And that excess runs from two and a half to six; that was present in your mind when you fixed your land values, was it not?

A. Yes, sir, it was present in my mind, and I aimed to take account of it in fixing these prices to an extent that would be
67 conservative and reasonable. I did not in any case use a factor of six; in fact, I did not use that general method.

Q. You did not use any factor to get right down and state a percentage, did you?

A. No, but I did use my own personal judgment, keeping in mind the fact that there was such a factor.

Q. In other words, you consider there were three elements; there are more, but we will divide it into three classes, the cost of the land for ordinary purposes, then whatever would be included by way of severance damages, and then what should be added by way of cost for purchase?

A. Yes sir.

Q. Did you fix any definite relation between the cost for ordinary purposes and the cost which it would be for railroad purposes?

A. No, I did not. In the matter of country lands, I had generally in mind a factor of two and a half to three, and used figures throughout that are based generally upon three times the ordinary value of country lands, plus cost of acquisition.

The cost of purchase of country land is always a considerable item. I have found no railroad purchases in Michigan where the consideration paid the owner was less than $20 an acre, and $25 an acre is a minimum average paid owner, where purchased by agreement for railroad purposes; where purchased by condemnation, it is considerably in excess. The difficulty in arriving at a figure representing fair cost to acquire land is due to the fact that very few railroads have separated the consideration paid from the cost of abstracts, salaries and expenses of right of way men, cost of
68 condemnation, etc. In one case, where separation was kept for a five-year period, the cost of purchase per acre ranged from 75¢ to $25, while the cost per owner dealt with, or per transfer, ranged from $98 to 140 plus.

The cost of acquiring a long strip of right of way from a single individual might probably be less than the expense of acquiring a small description from another person. Ordinarily, in dealing with a farmer or small individual land owner, it is necessary to make three to ten trips to see him, before a price can be agreed upon and deal consum-ated. . I know instances where cost of acquiring was in excess of total amount paid for land. The available information as to actual cost of purchase is not such as to enable one to definitely fix an average price per acre.

I did not fix an average price. In country lands, I have used a minimum of $25 an acre, in which I have included cost of acquisition. I should say that would range from $5 to $15 an acre, through territory such as this, assuming separate ownership. I have not added any specific amount, but have fixed what I believe fair figures, including the cost of acquiring. In South Shore territory, that cost would range from $5 to $15 per acre.

I fixed figures that in my judgment would fairly represent the money a man would have to have if he went out to acquire that property for railroad purposes. I am not able to divide the cost of land so as to give the figure added for cost of purchase. I did not analyze my land values so as to show market values, added increment by reason of railroad purpose, and added cost of acquisition. I am fully convinced that the figures I have named for country lands are so conservative that my total amount would be exceeded, if we were going to buy the land now, in the element of considera-
69 tion paid to owners, only. I do not believe my figures are high enough to cover any considerable cost of acquisition.

I am not able to point out the different elements that go to make up my prices. The results are a matter of my best judgment, and that might vary from that of some other man, up or down. My judgment was made up, based on inquiry, first, as to cost to railroads—the consideration paid to owners; second, upon inquiry and finding out that lands were valued in certain districts at so much per acre for the land, plus an estimate of the value of the timber standing on the lands, in the case of timber lands; and third, that cleared, improved lands in certain territories were selling at prices ranging from $40 to $75 per acre, and taking into account all the elements, I have used figures that I believe represent a fair average figure, although I think that in counties such as Ontonagon and Gogebic, for instance, lands that I have averaged at $60 an acre, actual purchases, actual considerations to the owner might range from $25 or $30 up to as high as $150 or $175, depending on whether it was cultivated farm land or whether it was covered with good timber.

I have since been over the line twice, on special trains, and from Marquette to St. Ignace four or five times, by daylight. I have been around Marquette yard and property more than any other part of the system. While I have made no attempt to make a complete list of items not included in my appraisal, I have noted a couple of classes of items: (*a*) riprapping in Marquette yard, and along Lakes Michigamme and Gogebic, (*b*) ticklers at overhead bridges and

numerous minor structures, and (c) the photographs disclose, and I have noted by various inspections, more masonry in the way of retaining and parapet walls built between piers and bridges, and at the end of culverts.

70 I think all of the points I have noted are of those general classes; e. g., either more masonry than we have estimated upon, or minor structures of which there is no record in the engineer's office. All were visible items of work, like riprap, which would be put in by the roadmaster, probably in no case part of original construction, but built subsequent to the building of the road, and a class of work of which no record would be kept in the chief engineer's office. The riprap omitted here in Marquette is 700 or 800 feet of bank that has been protected by the unloading of large stone.

I made no estimates of this at Lakes Michigamme and Gogebic; there is riprap at three or four places at each lake, in lineal feet more than at Marquette, but the embankment is not as high and does not call for so much stone, and the location would not call for as heavy protection as on south shore of Lake Superior. The additional wall I have noticed was at one point, in one of the steel bridges; I am not sure whether it is an iron bridge, or the other steel bridge west of Nestoria, but it is one of the two. Also one of the arched culverts between here and the Soo. It has 75 or 80 feet of protection wall, an extension of one of the wing walls.

The total amount of masonry on the road in connection with bridges is a very small item; only a few bridges have masonry in connection with them. The witness made notes of the omitted things.

In my opinion, reproduction new value may represent value for railroad purposes more accurately than the lower figures; while it is not true in every case, I believe that, where conditions are such that if the property were eliminated it would be reconstructed, the property is worth what it would cost.

71 In my judgment, if South Shore were obliterated, it would be reconstructed, as it is the only link of direct connection between Upper and Lower Peninsulas, and the only direct connection from Copper and Iron Country of Upper Peninsula with Duluth and the northwest. I don't believe it would be possible to reproduce the property as it stands today under $19,199,105. It might be possible to go 10 to 20 miles from Marquette and establish a new terminal. I mean it might be possible to get away from some of the more expensive terminals and build facilities for handling certain classes of business at a less cost, but it would be impossible to serve the same location on any other route. In many cases, it would be impossible to materially change the route; e. g., any line serving Marquette, Ishpeming and Negaunee extending east of Marquette would have to occupy about the same location as this road from Negaunee to a point six miles east of Marquette.

I think the road would be put back at a greater cost than its commercial value. If the road were out of here today, other men would be found who would come in and speculate on the proposition of a

road connecting the copper and iron country with the Lower Peninsula, and I think that the same considerations that caused investment originally would cause the reinvestment of enough money to produce the property. The belief that it was a good thing caused the original investment. I don't know what the original investment was, and made no endeavor to ascertain that, as many of the old records of the company were destroyed by fire, and so far as I know there is nothing in existence relating to original cost of M. H. & O., M. & W. or other extensions prior to the eighties.

Undoubtedly, many items of original cost of a property built many years ago would be less than reproducing the same
72 items today; that would be true of timber construction and hauls, and also items affected by labor, so far as original work was done at a period of low labor prices.

On other items, where the existing property is a replacement of the original structures, that would have cost more on first construction that it would cost to reproduce the property at the present time; that applies to all forms of steel construction, cast iron pipe, masonry and other construction work. I think it is true that, on the whole, a road built in the period of 1858 to 1888 probably did not cost as much as to produce the property today, new, on items of timber construction, such as bridges, buildings, etc. On real estate, the cost would be materially less.

To some extent, the road was built over land grant areas, and to a large extent through timbered areas, where it was to the interest of the owner of the land to have the road, to bring his timber to market; that would affect the price. I know nothing about the local conditions at that time, but that was the fact on a considerable mileage of similar territory in Lower Peninsula. I think an analysis of most of the gift right of way would show that conditions were attached to it that would really make a material consideration in many cases.

In stating, in my article before the American Society of Civil Engineers, that there should be but one value, whether for reorganization, sale, taxation or rate making, I endeavored to make clear that the engineer should report facts as he finds them, and give his best judgment of cost and depreciation, and that it is no part of his duty to decide what should be included or excluded for any specific purpose. The physical reproduction value should be the same, whether used for taxes or rate making purposes. My value of $16,132,083 for Michigan is my judgment of reproduction
73 value affected by depreciation. It may be too high or too low for any other specific purpose. I have not included or deducted anything on account of earning ability, going concern value or intangible value. In real estate, I have included a value due to the value of land used for railroad purposes, the severance damages, the continuity and all other elements that go to make a value for railroad, different from a value for other general, purposes.

Q. Is not the excess value that this continuous right of way has for railroad purposes due to the ability to make earnings from that continuous right of way?

A. The higher value given to railroad lands is in large measure due to the higher use to which the land is put, and to the greater earning power of the land under that new use, and that higher use and higher value is clearly a part of the reproduction cost, although not necessarily to as large a degree a part of the original cost, but it is clearly a proper element for reproduction.

Q. The only thing that justified it is the fact that increased earnings over the ordinary use of this property may be produced upon it; isn't that true?

A. That is one element. The fact that the land is available for railway use and desirable for railway use, and the fact that when put to railway use it is capable of earning more than other land not put to such use, go to give the land a higher value.

Q. Then there is a value in that sense due to earning ability, increased earning ability?

A. To an extent, yes sir, as far as that increased earning ability may be said to be part of the higher use, if I may use that term, of
the land, than if it was devoted to raising corn or celery, or
74 alfalfa. The reproduction cost would be the same, whether
the investment be profitable or not, and whether the rate for passengers be two cents or five cents a mile. I have not undertaken to carry out my analysis of land values to such an extent. It is practically impossible to go through a county and say that the average is so many dollars per acre for the land and so many dollars per acre for the severance damages to continuity, and so many dollars per acre for the cost of acquisition, because one piece may be acquired at one figure and another, nearby or immediately adjacent, at a considerably higher or considerably lower figure, and practically no purchase of land has ever been made where the owner of the court has fixed all of these elements; courts have undertaken to say that the land is worth so much and that the damages are worth so much.

Q. In other words, we cannot give that?

A. You cannot; I have never seen it separated or never known of anyone attempting to separate it.

I have not added anything to the value for strategic position. The location from here east, where I have used a higher figure, the figure was made wholly on account of the nearness to the city of Marquette, and the fact that it was desirable, especially desirable land for other than railroad purposes, and that the price of the land would be materially higher than the price of a similar number of acres located over near Sand River or near the west county line, but there are a few locations on the line of the road where the road occupies a narrow bench, or a narrow valley, that has a distinct strategic value, and if it were necessary to locate the railroad elsewhere it would be impossible to build the physical property of the road anything like as cheap as the present property has been built for.
75 I have not taken into account any assumed saving by
reason of such location. Take, for instance, this line going east; if it were not possible to locate on that bench between the foot of the bluff and the lake shore, it would be necessary to go back into

the hills, introduce very heavy grades, and introduce many thousands of yards per mile of earth excavation and embankment in excess of the present excavation and embankment, and there are a number of locations where a similar condition prevails, and the fact that the road is located in that immediate locality is worth a great deal of money to the road, and if the road were being reproduced they could afford to pay a good many hundred dollars an acre for that right of way, rather than to accept a free right of way elsewhere.

My value included any increase in increment along South Shore, in the belief that the railroad is entitled to include in its value whatever may come from the increase in land values, just as the owner of a farm is entitled to include the increase of his land, as property. There has unquestionably been a large increment of land value along the South Shore. In particular instances, the figures I have named as fair cost of reproduction is less than actual cost to the company of acquiring the land. There has been a decided increase in country land values in several sections of the state and along the line of the railroad, and in some of the terminals, in the last few years.

The purpose of the 1900 appraisal was to furnish information to the state authorities on which to enable them to base legislation for equitable taxation of railway and other public service property.

Q. It has been thought, previous to that time, that the railroads were not paying taxes enough.

Mr. Butler: By whom?

76 Mr. Wykes: By the public and the Governor and the people who promoted this valuation. That seemed to be the sentiment in Michigan that led to this valuation, was it not?

A. Yes sir, I think so.

Q. And the purpose was to increase railroad taxation, was it not?

A. Well, the purpose that Mr. Cooley had in mind and expressed throughout was that the purpose of the engineering work was to furnish information as to the true physical value of the property of the company, to enable the Governor and the Legislature to prepare proper legislation.

Q. And to increase railroad taxes?

A. I won't say anything as to the motives of the Governor, but the effort througout the valuation was to eliminate from the minds of the men on the work the purpose of the valuation, and that for the reason that every man engaged in a prominent capacity on that work was a railway official, not at the moment in railway service.

The purpose of the 1900 appraisal, followed throughout, was to make a fair value of the property of the railroads, and the work was done by competent men, the force being as thoroughly experienced a lot of engineers as has ever been gathered on any public work. Considering the shortness of the time, the fact that the work was done in winter, and that railroad records were not kept or were inadequate, it is one of the most wonderful pieces of valuation work done in the country, and, as a whole, it stands up as a fine piece of work.

The Cooley valuation of railroads, including the South Shore, is the nearest approach that has ever been made to a correct
77 valuation of any of the railroads of the state, and, while not at the time claimed to be absolutely correct, it was claimed by Mr. Cooley to be, in his judgment, the best that could have been done, considering the lack of hearty co-operation of the railroads and the limited time for the work.

While I give both cost of reproduction and present physical value, it appears to me that a company of individuals is entitled to a return upon the entire investment in a property, provided it is maintained at substantially 100% efficiency. That is my judgment and opinion of what is right and wrong. I do not assume to state, as my opinion, any conclusions I may have drawn from reading the different cases.

The depreciation of a property of this sort begins as soon as the structure is built, and, to a greater or less extent, goes on increasing from year to year. The depreciation from year to year is partially offset by maintenance, renewal and running repairs, but, in addition, a depreciation takes place that must be represented by the difference between cost of reproduction and present value, in that every unit of the property will, sooner or later, come to the end of its life. If the company does not lay aside from earnings a fund during the lifetime of a unit, to replace it when the end of the life comes, the company must stand the loss. This difference between cost of reproduction and present value represents the accumulated wear, tear and loss of life of the various elements of the property.

I think that whether one or the other figure is to be taken as the basis of rates depends upon whether the owners of the property received the benefit of that difference in dividends, or whether it has been used up in service and they have received no benefit. A property where excessive returns are taken out in dividends should
78 be differently treated from one which barely exists without caring for depreciation. If, as the property wears out, a sinking fund were created to represent depreciation each year, the investment would be intact, and on that theory there would be no question that there would be the investment there that should receive a return. If no sinking fund is created, the life of the property that is there to serve the public is being exhausted.

The I. C. C. rules require setting up a sinking fund, to take care of buildings, tracks, bridges and other structures. Prior to July, 1907, it was almost the universal practice of railroads to disregard depreciation. In my judgment, a fund should be created covering, not only equipment, but all forms of perishable property, and each year enough should be put into that fund to replace the wear of that year; each year should take care of its own depreciation.

Theorectically, every year should bear its own depreciation, but, practically, you cannot apply that rule, on account of widely varying accounting practice of the different roads in the past and the varying practice now regarding the setting up of depreciation reserves in the case of tracks, buildings, bridges and other structures, other than equipment. It is not obligatory upon the roads to set up

depreciation reserves for other parts of the property than equipment, though some roads have done so.

In determining a value upon which to base a fair return, there are many things which must be taken into account other than the mere cost of reproduction or depreciated value. In choosing between the two, you must consider all elements of the past history of the investment, its returns and depreciation. There are roads in Michigan
79 clearly not worth, for any purpose, what they cost, or what they would cost to reproduce, being examples of ill-advised expenditure of money, and the roads, if eliminated, would not be reproduced today, there being no necessity for their existence. This road, in my opinion, is not in that class, and, if wiped out today, it would be necessary for the state to have it reproduced. I think that if it were not here today, all other conditions existing as they are, it would appeal to investors as a good proposition and would be reproduced; that is, that money would be found for it.

Any appraisal is a reflection of the judgment of the man or men who make it. The Cooley appraisal was the first of its kind, and was made by men without previous experience in appraisal work. The opinions held by these men 12 years ago are not necessarily held by them today; many of them have materially changed their views on account of their subsequent work and investigation and more full knowledge. Since Cooley appraisal, the accounting system of the railroads has changed, and information not then accessible is now, and has been for many years accessible, and, instead of expressing opinions based on recollection, as was then the case, opinions can now frequently be based on facts capable of being drawn from actual accounts. I believe I now know more about valuation work than ten years ago, and I have changed some of my views radically.

Cooley appraisal of 1900 was regarded as sufficiently accurate to make it the basis of the 1902-1905 valuation, which was, in effect, the bringing of the Cooley appraisal of 1900 down to date, by part of the same men as were employed in the 1900 appraisal. They were among the best men. The time for the 1902 valuation was limited; there was no field work for Upper Peninsula. The purpose of the
80 1902 valuation was to prove that railroad assessments were not excessive. The effect was to show that the complainant railroads, of which D., S. S. & A. was one, were under-assessed to the same extent as the general property. The purpose was to sustain the 1900 valuation, which was in excess of the assessments.

In 1902, Cooley's instructions were the same as in 1900; it was his desire, and that of his men, to get a correct figure, as nearly as possible, irrespective of results. In 1900, the men were instructed to disregard the purpose of the valuation; in 1902, the men all knew the purpose of the valuation, but I do not believe that caused any improper additions to the valuation.

I think it is unquestionably true that an engineer engaged upon appraisal work is influenced; he is surrounded by men who are seeking to establish certain things, and his work is essentially affected to some extent by the object of the appraisal, and that is the reason why all of the Cooley appraisals have been done by the organization of a

staff of experienced men, and not be depending upon one or two men with a lot of subordinate clerks.

Q. That was what led you to devote two or three pages, in your article that you read before the American Society of Civil Engineers, tending to the placing of safeguards against this bias that was sure to come in any work of appraisal?

A. Yes, I believe thoroughly that where one man goes in to make an appraisal, and surrounds himself by a lot of young, inexperienced subordinates, who carry out his will absolutely, or who carry out the will of the men who are having the appraisal made, that appraisal is bound to be affected, more or less, by the purpose for which it was made, and that it is far better to have such an organization as we had in 1900, consisting of 25 or 30 men with years of experience, and men of standing, to offset that tendency.

81 Q. But even after that experience that you had in 1900, with that select type of men, and your experience of 1905 and 1903, when you wrote your article, you said in it that it was impossible to get this bias out of your results, did you not?

A. Yes, absolutely, for the reason that we had railroad men; we had to have an organization made up of railroad men, and every one of those men had inbred in him the old railroad employee's idea of the tax gatherer, and, if we had permitted the idea of taxation to prevail, the tendency on the part of every one of those men would have been to under-value for purposes of taxation.

Q. And so from that we draw the conclusion that it is impossible in an appraisal to be without some unconscious bias by the purpose of the appraisal?

A. I think it is safe to say that practically all of the large appraisals, the state appraisals, have been as free as possible from that. I believe that it is impossible to make an appraisal that is not somewhat, in some of the items, affected by that prejudice.

Q. And that might account, to a great extent, for the difference between a witness on one side of a case and a witness on the other side, might it not?

A. That might account for the differences in some instances.

The 1902-1903 appraisal brought that of 1900 down to date, and made material corrections in real estate values. On roads in lower part of Lower Peninsula, corrections were made in unit prices of labor and material and new property added since 1900. Prices of labor and material were increased; there was a general stepping up of prices between 1900 and 1902, each year. In 1905 or 1906 appraisal, the Cooley 1900 appraisal was the basis.

82 Professor Cooley was later employed to report to the Attorney General the then value of the railroads, in connection with the 1905 assessment; the time was limited to five or six weeks, and no attempt was made to go further than to bring unit prices to date, and use additions and betterments as reported by the railroads. The Cooley 1900 appraisal was used as the basis, with my approval; the unit prices were adjusted, and I think there was quite an appreciable increase in valuation. On South Shore, there was increase

in physical valuation of about $1,400,000, cost of reproduction, and $1,100,000, present value, between 1900 and 1905.

A non-physical value was added by Professor Adams in both the 1900 and 1903 appraisals; the increase in physical value was due primarily to additions and betterments; increased prices between 1903 and 1905 did not affect the value to a very large extent, though there was some increase; some small items were deceased.

My 1911 appraisal was hurried, on account of necessity of reaching a tentative figure for the purpose of the first affidavit. My field inspection was made before the making of the affidavit, and the determination of right of way figures was in substantially its final form at that time—about September 1, 1911.

I regarded Cooley appraisal of 1900 as the most complete information available on such items as grading, clearing and grubbing; it formed practically the only basis for a quick determination. The only correct way of arriving at schedule items would be to make a complete re-survey of the property, which would take several months and cost considerable. I believe a complete re-survey of the road would show an increase of 10% to 20% over the
83 earth yardage I have given. I applied new unit prices throughout, basing them upon recent prices of South Shore, or other roads in the locality.

In some items, they are materially higher and in some lower; on the whole, there is an increase over Cooley 1900 figures, but I think in matters of unit prices they are not greatly in excess of Cooley 1905 appraisal. The tendency of prices of labor, lumber, and such material, has been upward from year to year; prices on certain classes of construction, I think, lumber, ties, and materials of that sort, will continue to rise. The tendency of prices has been to steadily increase, except in the matter of rail; steel prices have remained absolutely stationary from 1900, and iron prices are more nearly stationary than other prices.

The cost to purchase runs through all my real estate values. This is made up of services, abstracting, recording deeds, and like features. I have considered the land price named sufficient to cover all those items prescribed by I. C. C. classification of construction accounts as assignable to the item of right of way. I included in my acreage, in every instance, lands acquired by adverse possession, but have made no deduction in those values for the absence of services in acquiring, for abstracts, or for recording deeds.

All of the mine branches have very heavy movement of freight over them, heavy cars and heavy locomotives, and the same is true of these main stems, and the ties are in decidedly better condition on these main stems than they are on some of the sidetracks, especially in such places as yards, some of the yard tracks, where an examination, track by track, of ties would show a very poor condition on some of the tracks were, apparently, no renewal has been made for years.

84 Q. I think you made the remark that these branch lines were maintained in just a sufficient ratio of condition to be safe to operate?

A. Well, that is true, but they are lines that must be maintained in such condition that locomotives can pass over the entire length of them, and that heavy freight cars on the mine branches, the heaviest equipment the company has, can be taken over them safely, and their position and location is such that a derailment on any of them is a serious matter.

Q. But the logging and other branches, and industrial tracks, wouldn't be maintained to the same point that these mining spurs are?

A. They have to be maintained in a safe condition. They are not as high grade tracks as the mining tracks, but they are tracks that locomotives are going in and out of, and they must be maintained in a safe condition to operate without accident or derailment.

The percentage of 60% for ties is the ratio applied to express the condition of entire line, and inspection would not necessarily show that to be the exact condition on a specific branch. I think that, in general, the ties on the branches are not maintained in quite as good condition as on the main line, but annual renewals are made on these branches, and the ties on some of them, like some of the lumber tracks, are in considerable better than 60% condition, by reason of the fact that the tracks are comparatively new. There has been, within the last four or five years, quite an increase, a large increase, in this class of mileage. There is 39 and a fraction miles of net increase in track mileage, by far the major portion of which is sidetrack and branch. The acreage of right of way has increased comparatively little in the ten years since the Cooley appraisal.

85 In fixing prices for 36 acres at Humboldt and 18 at Champion, I had no sales for railroad or other purposes. At those places, I took into account the ways lands were cut, vicinity of buildings, mining properties, etc., with considerable land at Humboldt included between the two lines, and that the severance damages in the vicinity of Humboldt would be very serious in case of reproduction. At Champion, the old line to Champion mine runs right through the village, and the new line runs adjacent to and north of the village.

Land values in the vicinity of Champion and Humboldt are affected by known or prospective mineral values, but I have not placed any value that reflects mineral rights. If it is taken into consideration, the prices would be very much in excess of those I placed, of $350 to $500 per acre. If reproducing South Shore, it would be essential to have 18 acres, for the use of this company, at Humboldt, though, by changing the connection between the two lines, and shortening up the wye, the amount of land could be materially reduced—say one-half.

My property values are:

Service.	C. O. R.	P. P. V.
Exclusive Passenger	$507,665	$377,133
Exclusive Freight	5,557,099	4,184,647
Common Passenger and Freight	13,134,341	11,570,303

Apportioning the common property between passenger and freight services on the revenue train mile basis for 1911, of 48.28% passenger and 51.72% freight, assigns:

86

Service.	C. O. R.	P. P. V.
Passenger	$6,341,260	$5,586,142
Freight	6,793,081	5,984,161

Adding the passenger and freight proportions of the common to the exclusive passenger and freight gives:

Service.	C. O. R.	P. P. V.
Total Passenger	$6,848,925	$5,963,275
Total Freight	12,350,180	10,168,808

I have worked out no other basis for the division of the common property; on some bases, it would possibly be widely divergent from the apportionment I made, and on others it would closely approximade it. These figures are the allocation of my values for the property between passenger and freight. It is impossible to separate the common property, except through some outside basis of apportionment. I believe the revenue train mileage basis for division to be fair.

At the Soo, plaintiff acquired 84 acres for right of way, yards and terminals. In my opinion, this is all absolutely proper, and is no more than such a railroad as this should have in such a city. So far as actual present use of 84 acres of Soo property is concerned, only a very small portion is presently used for railroad purposes. Plaintiff has parted with a half interest in its own land through lease for joint use, acquiring a half interest in the 84 acres of Soo Line, not presently used.

The original 84 acres of plaintiff at Soo is no more than a prudent railroad manager would require for railroad purposes, building into that city. The probability is that all that acreage not built upon will in course of time be used; the same thing is true of the Soo Line property. But at present they are using, under joint lease, the terminals of the other road. If they were two hostile roads, there would probably be a duplication of yards, roundhouses and other property on these two parallel strips, and I hardly know what is a proper disposition of the unused lands in that instance.

87

All plaintiff's land at the Soo, except 7 or 8 acres of made land, which at one time had a sidetrack extending entire length, is in pres-

ent use; the 7 acres is included in my valuation as water front riparian ownership, which, to me, seems reasonable for future development. I think there is no present railroad use of the water front through this made land and extending west; there is no development in the way of mercantile wharves, etc., but it is land suitable for development for general merchandise docks of the company, for transfer to and from boats and cars. So far as I know, there are no plans for developing this water front, or for the use of the Soo Line property.

In my opinion, the land acquired by plaintiff originally is an absolutely reasonable amount to acquire and hold for railroad use; the same is true of the Soo Line. The element of uncertainty is introduced by the arrangement between them.

I think the lands held by plaintiff will all, in comparatively near future, be used for railroad purposes, and that, ultimately, all the lands owned by both companies will strictly — used for yard and terminal purposes. The growth of the community would cut a great deal of figure in whether those would be necessary. I don't
88 think the fact that the Soo has increased but 2,000 (or 10%) in population since the development of its great water power would have any bearing in the matter at all, as the failure to grow was due to the collapse of the boom due to the Clergue industries.

I should think the trans-continental business through the Soo calls for terminals there. The importance of the Soo as a terminal and manufacturing point makes it almost certain to have a future. The Soo is a sort of a semi-terminal for international freight passing through it, east and west, it being the terminals of South Shore, Soo Line and Canadian Pacific, trains being made up there for moving eastward on Canadian Pacific. They combine the trains of the two roads (Soo Line and South Shore) that move eastward, at the Soo, and Canadian Pacific business is broken up and divided at Michigan Soo.

At St. Ignace, the following property should be excluded as not being used in railroad business: Humphrey lot, $1,030, right of way to Martel furnace, $3,423, 1,206 lineal feet of track of same in place, and hotel lot.

In my affidavit, I excluded about one-half the acreage of the 70-acre tract (made up of 36 and 34 acres); I think entire 70 acres is properly railroad lands, and see nothing about it that would cause me to say any of it is not proper for plaintiff to own for yard extensions and shop facilities. Main line runs through the land east and west, one-third the way from north line. I think whole of right of way on one side is fenced, and portions of the property are used for manufacturing, and must be leased.

As to the water front property excluded in my affidavit, there are a couple of pieces that, so far as use for water front is con-
89 cerned, cannot be said to be in present use; one is described as water front outside harbor, and is in at $35 a front foot. The land extends from highway to water's edge. It is an open question whether any part of the hard land can be excluded. The riparian rights are not used; the land is used as a right of way, and the shore is riprapped along that frontage. From the main line track

to the water, it is not to exceed fifty feet; in places, it is 25 to 30. It would be possible to develop that by starting at either end, to get on to it. Use of riparian frontage there would involve considerable harbor improvement, making it expensive; there is nothing which would prevent its use, or that would make the cost prohibitive.

The hard land there is all used as main line right of way, and the center of main track is all within 60 or 70 feet from water's edge; my $35 a foot includes the right of way and riparian frontage, and I took the value of riparian rights into consideration in fixing my value.

A small acreage of land on south line, where plaintiff, in acquiring right of way, acquired the entire pieces, and where the building of the railroad has destroyed any value that this property had for other purposes than right of way, I have not excluded; such land should not be excluded. The 3 to 5 acres of this character is not actually used, the value, in my judgment, being entirely destroyed by the construction of the railroad. The value through here was $200 per acre, including the piece spoken of.

This is one of those things incident to purchase of railroad right of way, where right of way costs less if entire piece is taken than where right of way only is bought and damages paid for the remainder. It might have a value for pasture, if joined to the adjacent land.

90 In the neighborhood of the 70-acre tract, there are unused lands belonging to private owners; there are vacant and unused lots all through the city and in there. The property immediately south, joining this 70 acres, is not platted. In placing a value on the railroad property, the proper basis would be to ascertain what that property would be worth if platted. On all of these properties, the question was, what would the property be worth for other purposes. I platted no sales to determine the base value used for the 70 acres, but made inquiry as to lot sales in the vicinity, and used a figure not in excess of sales prices there. I was given sale prices and prices upon lands held for sale on the street that the Federal building is on, which is one of the principal thoroughfares of Marquette.

So far as I know, there is no present railroad use of Spring St. extended, Front to Lake Sts., 40 feet wide. There is a piece on the corner of the same block north, on Lake St., which is vacant; there may be some storage on it.

There are two pieces of land, one on each side of overhead approach, that were, unquestionably I should think, acquired when right of way for approach was acquired. That property would come in the class of lands that plaintiff would be compelled to purchase to maintain the high trestle across the street, and, having put up the trestle, it would be unsalable for any other purpose. I do not think it would be possible to buy two 50-foot lots to maintain a trestle 60 feet in height, and then hold that portion of the lots, 30 or 40 feet, not used for railroad purposes; I question whether it would have any sale value almost immediately under that trestle. I place on all the property in that block $50 a foot. If that were a fill, you would need it for the slopes.

91 Plaintiff's property at Marquette was acquired by at least three or four different corporations, at different times, namely, M. H. & O., M. & W., D. M. & M. and the Dead River. There were three railroad lines converging in Marquette about 1888:

The Marquette & Western had complete terminal facilities at Marquette, with shops and roundhouses. The south yard, and the main line from a point near the present station, along the water front, to the old roundhouse, and then out over what is known as the south line, belonged to this company.

The Marquette, Houghton & Ontonagon owned the north line entrance into Marquette, from the depot west, including the present roundhouse, shops and west yards.

The Detroit, Mackinaw & Marquette owned from the old roundhouse, near Jackson St., out along the water front, to the south and east.

These facilities were consolidated in the plaintiff, and, to a certain extent, there was a duplication of facilities.

I suppose that what is the present water front inside the harbor was originally divided between the M. H. & O. and the M. & W., and there is a riparian ownership on land that was clearly the right of way of the D. M. & M.

The 1,100 feet outside harbor is not used as riparian property, but as right of way, and every foot is in use to the extent that it is covered with railroad embankment and embankment protection, and railroad tracks. Whatever value the property has in the way of riparian rights is not now used by plaintiff. The 50 feet is actually occupied by the track, and along almost the entire front plain-

92 tiff has been compelled to haul and unload stone, to protect the railroad embankment from being washed by the waves. The whole strip of property is no more than enough to maintain a single track between the road and the lake.

I placed a higher value per front foot on it than on adjoining lands, as its ownership carries with *it* the riparian rights, which are not used. Outside the right of way, there is no land; it is a narrow strip of land between the highway and the lake. It carries with it the riparian rights out to the harbor line, and no use is made of the lands under water.

The L. S. & I. in Marquette didn't go through Lake St. on a free grant; if all the items of general expense connected with the acquisition of that right of way were segregated, it would be an expensive piece of right of way. I am basing this on the knowledge that the amount of money paid engineers, to try and work out that line through the streets, ran into several thousand dollars.

If right of way of South Shore opposite the 1,100 feet were in the street, I don't think it would make any difference in my estimate, though I have included 4%, aggregating something like $600,000, for engineering, etc. Even granting that there was no consideration in money paid for the land actually occupied, there is the question of abutting damages to be settled; that makes that class of right of way the most expensive kind to acquire.

In Main St., Front to Third, plaintiff was granted the right to

place its track to the old ore dock, occupying perhaps 30 feet and leaving a driveway on north side used for a street and on south by plaintiff as entrance to its depot. For that 30 feet, I included $75 a foot front, $50 on west side of Lake St. and $450 on each side of Front St., on the theory that the property is in the possession of
93 plaintiff, in actual railroad use, and that to acquire it today would cost not less than those sums. I would consider that property on the principal streets of the city located as this is would have a per foot value substantially equivalent to the value of adjacent near-by and similar property, without respect to whether acquired by deed, grant from the city, or in the course of litigation.

The $450 per foot includes all the elements of cost. Where I have allowed per foot prices, I think they are not in excess of reasonable and usual values for similar property, but that includes whatever there is allowed for acquisition. I endeavored to place prices, where I take it by the front foot, on the same basis as the value of adjacent near-by and similar lands, as I have been able to ascertain them, without regard to how acquired.

In my inspection for grading, I made no measurements, and took no cross-sections, but I had with me and examined, in going over the road, plaintiff's profiles, and at a number of points I checked, for several miles, the cuts and fills, to satisfy myself that the profiles were the correct profiles of the line, and that the work shown thereby had been completed. They were the original construction profiles, or copies; Ex. 2 is a condensed copy. We had the regular profiles with us, but did not use them to any great extent.

After determining the quantities of grading, based on the profiles, I made certain additions which were not made in any of the Cooley appraisals; e. g., shrinkage. This was discussed in Cooley appraisal, it being the intention of the Cooley appraisal to include sufficient yardage of earth to allow for shrinkage. My recollection is that no specific allowance was made for overhaul, it being the intention to use a price per yard sufficiently high to cover that. It is customary among engineers to add a percentage to profile quantities for shrinkage.

94 I satisfied myself that whoever had made the computation from South Shore profile had not allowed sufficient to cover shrinkage or waste, and that no allowance had been made for raising embankment, which has been done to some extent on South Shore, nor for filling certain bridges, filled prior to 1900 appraisal. For that reason, I added 10%, to cover shrinkage, and 7.5% to cover the other item. From subsequent examinations, I am convinced that my percentage additions are not high enough, and believe re-measurement and re-cross-sectioning of entire line would disclose at least 1,000,000 yards total more than I have estimated as having actually been moved in construction.

Cooley appraisal price for earth grading was 25 cents per yard. My recollection is it was discussed and decided that that price would be sufficient to cover overhaul.

In Minnesota and other state appraisals referred to on direct examination I do not know whether they added a percentage for shrink-

age, or how they arrived at their quantities. It must have been added in additional quantities, because their quantities are higher; I draw that inference from the knowledge of the quantites they get and my knowledge of what would result from the profile. The inference is that it must have been added somewhere; but I don't know how they arrived at the figures showing the yards.

In other state appraisals for which I gave costs for grading, I do not know whether those took into account the items of overhaul and shrinkage in fixing the price, or whether a percentage was added; I assume those elements were taken into account, but do not know in what form. The general instruction in Cooley appraisal was to add to figures computed from the profiles for shrinkage, but my ex-
95 amination of the profiles indicates that the Cooley yardage was made by taking the embankment yardage as disclosed by the profile. I figured it for portions of the line, and reached the conclusion that whoever figured it for the Cooley appraisal did not make these allowances.

I satisfied myself, by examination of the profiles, that Cooley appraisal used embankment figures only. I tried to ascertain how the Cooley figures were made up. I did not go to the original records to find out, but the Cooley appraisal, as it appears in the final report, is in sufficient detail to enable an engineer to arrive at, in a general way, a correct conception of the method used. The results, on my computation of the profiles, appear to be a little more than those figures on the Cooley appraisal, and from that I reached the conclusion that nothing had been added for shrinkage. I went far enough to satisfy myself that Cooley appraisal figures were not high enough to represent actual amount of material used.

I didn't re-compute from the profiles all of those quantities. To have done so, would have taken a force of men a couple of weeks, and would have taken my time for a couple of months. Using Cooley figures as a basis, and my judgment as an engineer, I made this as an approximate estimate of the yardage of material in this work, and am satisfied a re-measurement of the work would show an increase of from 1/5 to 1/6 of the total yardage. I have been back and forth over the road, and have had those profiles, and feel certain, from general knowledge of railroad grading, based on twenty-seven years' experience in construction work, that there is more yardage per mile than I have testified to.

I satisfied myself that Cooley figures were arrived at by taking embankment figures. The Cooley figures are divided up in various sections, and by checking any one of them from the profile it
96 can be found out how the Cooley figures were given. The rules of Cooley appraisal required the engineer estimating grading quantities to add for shrinkage. Afterwards, without looking at the computations made by engineer on Cooley appraisal, but from profile computations of my own, I decided he could not have followed those rules, or added for shrinkage, and I added an additional 10%. Straight through, I have added to Cooley figures 10% for shrinkage and 7.5% for other elements, or irregular slopes, extra

grading at various points, and overhaul. The total amount added for shrinkage is $178,000 plus.

I added to Cooley appraisal yardage of grading 17.5%. This particular item depends on judgment, without possibility for reaching actual results, about as fully as any other figure in my appraisal. A correct estimate depends largely on the judgment of the engineer making it, and the accuracy of that judgment would depend largely on his experience and his knowledge of that class of work.

A yard of earth coming out of a cut will temporarily make considerably more than a yard of earth in the fill; it will then settle, and we require the contractor to raise the fill. In practical construction, we take care of what is known as shrinkage in setting the stakes in the fill at a higher elevation than the final height of the fill, and then settlements will take place, and frequently it is necessary to raise and widen the banks. The shrinkage is between the line we fix for the contractor and the line to which his embankment subsequently settles to be—the profile line. We put the shrinkage on the contractor; the contractor makes his price based upon earth in place, after the settlement has all taken place.

The earth is paid for on its quantity, as it lies in the cut, as a rule. It frequently happens that earth is paid for in the
97 fill; it is then paid for on measurements of the fill plus shrinkage. In practice, you measure all of your cuts and measure all of your fills, in order to keep a line on your overhaul.

I uniformly allowed 30¢ a yard for cost of earth grading, as of the middle of 1911, which is my judgment of the fair price, in view of the fact that I have not classified hard pan, and have not allowed overhaul except by yard. The price is not based upon my personal experience in Upper Peninsula, as I have done no contract work there since prior to 1900, and that previously was not comparable with this.

Range of prices in past few years, depending on character of material moved, is 24¢ to 38¢, unclassified, and some contracts are higher for hard pan and lower for earth; the prices depend upon equipment used and quantities moved. Mr. Young testified, or said, that for new cut-off he had bid prices of 27¢ and 30¢ per yard. On making up his mind that the company could do it as cheaply, it was done by company, at prices over 27¢. This higher price was due to finding underground ledge of rock, which in part paralleled the line of excavation, increasing the cost. I do not know as Mr. Young's 30¢ price included rock; there are no very accurate records. I talked with Mr. Young, got his price, and confirmed it from company records. I found cost of part of new line built by the company, and that is part of my basis for 30¢.

In getting at cost of 2.4 miles of new line, I used actual cost. I assumed the earth to be moved at 30¢. From that I found the number of yards; I did so, as I had no record of the yardages; I had an approximate estimate of Mr. Young's yardage, but none of that moved by company subsequently. So I deducted the known
98 rock at $1.25, and divided the remainder by 30¢, to give the number of yards. I then multiplied back, to get the cost.

I had Mr. Young's cost and yardage. Mr. Young did about one-half the work; i. e., for one track; company built the grade for second track. For both, this totaled a certain amount. Mr. Young's and Mr. Simar's estimate of rock was 6,000 yards; they had no definite figures, but used 6,000 yards. I confirmed this by inspection, without measurement.

As a basis of my 30¢ grading price, I also used my experience in contracting this class of work over past 5 or 6 years. Besides the figures on cut-off, there are numerous other figures where South Shore contracted several small pieces of work; e. g., on small contract—on Palmer and Mary Charlotte branches—prices, 22¢ to 40¢ for earth, 40¢ to 60¢ for hard pan, and 45¢ to 60¢ and up for loose rock; they were such small contracts, I do not think them a fair criterion.

With hard pan classification, price of 25¢ to 30¢, with an average of 27¢, would prevail on this whole line. Contractor makes higher price for hard pan, due to greater difficulty in moving. It is difficult to say what will develop in respect to character of earth—whether there is much hard pan—from going over the line.

The 22¢ price was in sand country, on Deranson spur. Most South Shore contracts have been around or above 30¢. I should accept Mr. Young's statement, that grading cost over 27¢ and close to 30¢, as correct. I feel the 30¢ for grading fair, taking into account absence of hard pan classification. It is 5¢ higher than Cooley 1900 figures, and there has been a material increase in labor cost since then. Cooley price included overhaul, which is here added, as part of an additional percentage. Had each appraisal (Cooley and Riggs) been based upon known yardage in same
99 territory, so they would be comparable, my price would have been a little lower than 30¢ or his a little higher than 25¢; mine would be relatively higher.

Cooley 25¢ price applied to entire state. So far as soil conditions are concerned, Upper Peninsula and Lower Peninsula are not radically different. Labor conditions are more difficult, teams are harder to get, and distance of hauling supplies is greater, in Upper Peninsula than in Lower Peninsula, and cost of maintaining camps and boarding outfits would be greater in the Upper Peninsula.

The 17.5% added to represent shrinkage and other items would be affected and increased by overhead percentages of 26.5%.

I did not depreciate ballast. There is on all roads, especially those with gravel or cinder ballast, a necessity for furnishing additional ballast to take care of maintenance of track as the joints are lifted, and to take care of the ballast necessary to support what we term "shoulders"; that is, sufficient amount of ballast at the ends of the ties to hold the track to line and prevent swinging out of line with passenger trains.

The purposes of ballast are: (*a*) to permit drainage, (*b*) to furnish elastic foundation for ties not subject to rapid deterioration from storm, and (*c*) to hold the track to better line and grade than possible with ordinary earth. There is added to the ballast every few years additional yardage, in the nature of a maintenance expense;

like track surfacing, it requires more or less work every year, to keep it up to the standard of operating condition. I consider the cost of placing the ballast, after it is placed, like surfacing, is maintained to substantially 100% of operating condition by the large amount of money spent upon the track in maintenance every year.

100 I decreased the yardage of ballast, shown in Cooley appraisal, 10%. The additional work of ballasting increases the number of cubic yards of ballast on every mile, though I don't believe you would be justified in adding to yardage per mile after you have reached a proper yardage for this class of ballasting. Ballasting is like track laying and surfacing—as long as the road is maintaining its property and spending $400 or $500 per mile per year in maintenance of track and ballast, I do not see how we can consider that the ballast is losing any of its value. There might be a little deferred maintenance,—that is, one mile of track might not have all the money that is coming to it this year,—but next year it will get it, and the material is all there.

There is an appreciation of roadbed due to ballasting during, possibly, the first 12 or 15 years. After the first few years, not a great amount of ballast will go into the earth. The more ballast you put on, the better your drainage, but that is about the only advantage after the first 10 or 12 years.

After ballast has been delivered, placed and dressed, it is unquestionably in 100% condition, and I would go further, and say the same at the end of one or two years, after the track had received a second and third lift. I mean that after ballast had been re-surfaced in the course of maintenance two or three times, and on a well maintained road all of the track is gone over once a year at least, I would say that the track was in better and more suitable and stable condition than when the ballast had been first delivered, and that, while there might be apparently less ballast there, you couldn't say there had been any depreciation of ballast, because your track was really more stable and in better condition than it is immediately after it has had its first—after its final dressing up, im-

101 mediately after the delivery of the ballast.

The road must be gone over every year; every foot of the track is jacked up and lined, put to exact line, and all the ties are tamped under. They loosen up the centers, tamp under the rails, and get that track in perfect condition; that has to be done every year, no matter what ballast material is put on, and whether new ballast is added or not. New ballast is not added yearly; sometimes 4 to 6 years elapse. Now, all of that lifting and tamping results in eventually taking more ballast under the track, and less around on the shoulders, and the only depreciation or deterioration that takes place after three or four years of such work is such mixing of part of the ballast with the earth of the embankment as comes in the handling of gravel on top of the sand bank or clay bank.

Q. And in addition to this doing something to the ballast every year, there comes a period when you must put in new ballast; that is true, is it not?

A. There comes a period when it is desirable and sometimes ab-

solutely necessary to put in some new ballast, to take the place of that which has disappeared from the shoulders and been driven down into the roadbed.

Q. But at the time that that ballast was first put in, there was no necessity, then, for anything else, was there?

A. No, if the road was fully ballasted, or given a sufficiency of ballast, at the time it was put in and after the final lift had been made, and after the final dressing up of the new ballast, I think we would say that the ballast was in 100% condition. Now, a year from that time after the road had received its annual re-surfacing, in my opinion, that piece of road would be better—that
102 ballasting would be better than entirely new ballast.

Q. But there comes a time when we must put on each mile of that not less than a thousand yards of new ballast, at a cost of $500, within the next four or five years?

A. The time may vary, but there comes a time when it is necessary for us to put on more ballast, ranging from 400 to a thousand, and on some lines perhaps 1,600 yards—yes, unquestionably. That keeps on just as long as the railroad runs. The ballast under the roadbed proper I think may be said to go into the ground further; the tendency is, of course, to drive; the weight of the train comes directly over the track.

I have followed the precedent of Mr. Cooley and other appraisers, that, so long as the property is maintained, the labor elements in track laying and surfacing do not undergo depreciation. I think there have been some appraisals which depreciate ballast, though the general practice has been not to depreciate ballast or track laying. In 1900 appraisal, depreciation was allowed on not more than 3 or 4 small properties, which had never been re-ballasted. Ballast on South Shore was not depreciated in Cooley appraisal.

Q. The deterioration of ballast is described by the term being worn out, isn't it—ballast worn out?

A. That term has been used, and is to some extent used, among railroad men, having particular reference, I think, to the fact that the surplus ballast necessary to maintain the shoulders and proper filling of the track has to some extent been reduced in quantity, or partially disappeared. I think that, to the extent that ballasted track is permitted to deteriorate for a long period of years after the ballasting on the shoulders disappears or is reduced in quantity, there might be said to be some wearing out.

103 If the ballast goes to a point that there should be a renewal, and there is no renewal, but, on the other hand, the company continues, year after year, working over its track, using the same old ballast, it does, in the course of time, become so mixed with other earth as to lose much of its value as ballast, and in that case I should say that there was a depreciation.

Q. Well, hasn't it lost its value when it goes to a point where you have got to supplement it by something that costs, as you stated this morning, from $250 to $750 a mile of track to put it back into the condition where it started from at the last renewal?

A. No, I don't think so. We started out with our assumption that

new ballast, after it had been surfaced and dressed, was worth a hundred per cent, or was in a hundred per cent condition; that is, it was new. A year from that time, it has become settled; it has gone a little bit into the roadbed, but after it is resurfaced, the track is in just as good condition and worth just as much money as railroad track, and just as near a perfect condition as it is possible to make it. Now, the same thing will happen the next year. During the period between the maintenance of 1909 and 1910, the whole track depreciates a little; some of the joints get low, some of the bolts get loose, and the ballast is pounded down a little more at one place than at another, but the repairs that are put on it keep it in safe condition, and, at the end of the general lifting and surfacing that the road receives every year, it is brought back to substantially perfect condition. Now, after five or six years, you put on more ballast, and it is not like the taking out of an old rail, where you completely remove all of the rail, nor like the taking out of a tie that has rotted, when you pull it out and put it out on the side of the right of way and burn it up; all of the old ballast remains there, and along with that old ballast is 500 or a thousand yards per mile of additional ballast, and you bring your track—you commence, then, to
104 put your track into your hundred per cent condition, but the condition of your track when you commence to put in this second lift is far better than it was before there was no (any) ballast at all.

Q. With the lapse of time, and with use, a part of the useful life of the rail disappears, doesn't it?

A. The rail wears out.

Q. A part of the useful life disappears, doesn't it?

A. Yes, every year.

Q. And with ballast, a part of the useful life disappears with the lapse of time and with use, does it not?

A. No, I fail to see how you can wear out broken stones; you can mix it with dirt.

Q. Doesn't the useful life of it disappear; that is the point?

The Master: In the position that it occupies?

A. No, it doesn't. It may get out of place; it may settle down under a wet joint.

Q. Then, if the useful life doesn't disappear, what is the necessity of putting on more?

A. The necessity of putting on more is to replenish the shoulders, to replace that which has worked into the embankment, and to replace that which has been lost by the operations of the men.

Q. But, if the useful life of that ballast had continued the same as when it was put in, in the same condition, it wouldn't be necessary to put more there, would it?

A. If it were not necessary to work over that ballast, it wouldn't be necessary to put over more. It doesn't wear out under
105 traffic, as your rail does. It doesn't rot, as your tie does, and whatever depreciation there is comes from the fact that you

are working with it. Now, if you are spending $600 or $700 a year, as is the case on some classes of road, or from $400 to $500 a year, as is the case on other classes of road, in maintenance, in operating expenses, in maintaining your track, I fail to see how anyone can justly arbitrarily say that the value of any part of 3,000 or 3,500 yards of stone has disappeared.

Q. When you put it there, it is in position where it is useful and where it has 100% value, and where it is not necessary to put any more there; that is true, isn't it?

A. That is true.

Q. And by reason of use, by reason of the lapse of time, it gets away from that position, doesn't it?

A. By reason of use, and by reason of the lapse of time, it is driven into the embankment, and some of it gets away from that position, yes.

Q. And you cannot get it back to the position where it is 100% value, and where it serves every useful purpose that is necessary, can you?

A. No, perhaps you cannot get all of the ballast back in position in which it was when it was first placed, but, on the other hand, you cannot pick out, on a well ballasted road, any mile of track and say that this mile is in 90% or 80% or 70% condition. The chances are that measurements made on any ballasted mile of this road would disclose the fact that there is substantially as much ballast as I have estimated, and on many of the miles measurement by excavation would show from three to four times as much gravel as I have estimated.

Q. That is not the question. I want to confine you to the question of depreciation?

106 A. Now, my point is that there is no way in which you can determine the depreciation of stone, because your ballast is in reality nothing but stone delivered along the road. The only way in which depreciation would really come would be the disappearance of material, by the actual disappearance of ballast; you cannot say that because weeds or grass are growing up in ballast it has depreciated. I do admit that in the course of time it does disappear, but I do say that the ballasted sections of this railroad doesn't disappear to any such extent that it is possible for any engineer to come on the ground and say that 10% of it has actually gone.

The Master: By ballast, I think Mr. Wykes means ballast in position, and by ballast, you mean ballast, whether in position or out of position.

A. There is this distinction, that must be kept in mind: The classification of accounts provides for ballast as laid down along the track. I have included in my price ballast in position, but the ballast, the stone itself, is purely an item of material, just like ties or rails, and the labor of placing the ballast in position is, in reality, surfacing.

The Master: That is where you and Mr. Wykes part company; you are talking about ballast, absolutely, which does not deteriorate,

and he is talking about ballast after it is put in position, which includes the labor, and that does include the labor.

Mr. Wykes: I don't think I misunderstand Mr. Riggs, or that Mr. Riggs misunderstands me; the only difference between us is that he, perhaps, doesn't entirely agree with what I think is consistent.

Q. Now, Mr. Riggs, you take a railroad that is completely ballasted, so its ballast is in 100% condition; take the same railroad—that is, just the ballast item—three or four or five years later, during which intervening time there has been no ballasting; is the
107 ballast not worth more at the time you start with your ballast new than it is at the time of the lapse of 3, 4 or 5 years, when it becomes necessary to re-ballast the entire road. I wish to exclude that *that* for the purpose of this question the question of appreciation of roadbed; I am talking about ballast, solely?

A. I think that if you would extend your period of time, and not limit it to 3, 4 or 5 years, I would answer yes. I mean, by that, that, if a railroad is built new this year and ballasting is completely finished this, unquestionably some parts of the road will show greater loss of ballast than others, and, if no renewals of ballast are made at all for a period of 5, or possibly of 6 or 7 or 8, years, I think that, unquestionably, the ballast at the end of that time would be worth less, by the fact that a certain number of yards per mile of ballast, on the average, had disappeared, or that, perhaps, on some miles substantially all of the ballast had disappeared or gone into the bank or had become mixed up with the earth so as to lose its character of ballast. But, if a railroad begins at the end of the second year to replace ballast, and replenishes the ballast at the points where it is most needed, and continues that replenishment, treating, every year, a few miles, I do not think that, in that case, you can say that you have a condition where your ballast on a mile of road is worth less than your original cost of ballast, because, when you replenish your ballast on a mile of road that already has three-quarters to four-fifths of the original ballast there, you certainly are starting with a better condition, and your new 100% condition is certainly a better condition, as far as the track is concerned, and as far as the usefulness of that ballast is concerned, than it was originally.

Q. You haven't answered the question of whether a road is worth as much immediately before the period of new ballasting as it is immediately after the last period of new ballasting?

108 A. I could conceive that, if no ballasting was done on a road, the ballast would be worth less at the end of a period of years than it was when first new. Now, this question assumes that a railroad is ballasted, permitted to run for a period of years, and then completely re-ballasted. No such condition as that prevails.

Q. Get it down to this point: Apply that question to a mile of ballast on a railroad; you will admit that a mile of railroad is ballasted at perhaps reasonably stated intervals?

A. Yes.

Q. Would a mile of railroad, so far as the item of ballast is concerned, be worth as much immediately before the period of new ballasting as it would immediately after the period of old ballasting?

A. Well, now, there comes in the question of what kind of a mile you have assumed.

Q. Any kind of a mile that is ballasted should be ballasted again, I don't care, of an existing railroad that has gone for a reasonable period of years?

A. I think that, if the track upon a mile of railroad is maintained to su' stantially perfect line and grade, the adding of new ballast and again putting that track in perfect line and grade would make no difference in the smoothness of that road, or its value as part of an operating railroad. The placing of the new ballast would give an additional yardage.

Q. And an additional cost value?

A. And, to that extent, might give it a material added cost value.

Q. So it would be less value immediately before you had to spend from $250 to $750 on that mile for ballast?

A. Unquestionably, the adding of from $250 to $750 worth of ballast per mile would put the road in better condition, and
109 the road should be better, to the extent that there was that much more ballast on it. The whole thing is so intimately tied up with the condition of the particular piece of track that was under investigation, as to its maintenance and as to whether that mile or that section has received, during the year or during the period of years, its due share of maintenance. There may be deferred maintenance on the whole track; that would affect the conditions of the track ballast, as well as the track laying and surfacing.

Q. Deferred maintenance would mean a deterioration which should be depreciated, wouldn't it?

A. No, not necessarily. I think I can illustrate that better by another class of property than railroad property, because railroad main line property per mile should receive su'stantially its due share of maintenance each year. But emergencies often arise where in one year a certain stretch of track will receive more than its share, other track being neglected; the next year, the section that has been neglected will receive its share, but, where the general average of maintenance per mile of road indicates that there is no neglect, I don't think there should be any depreciation, even though there is a deferred maintenance on some particular miles of road.

Q. And even though that would require a considera'le expenditure to bring it up to full serviceable condition, to the best condition it could be in?

A. If your road is being neglected, and if your maintenance accounts show that you are not spending your money on your track, to maintain—you are not spending a normal amount of money, then, unquestionably, your whole road is depreciating; but, if you are spending the money, and you are not increasing the value of your property by reason of these expenditures, that is, if you are
110 legitimately maintaining your property, and are making no additions to the property account on account of those expenditures, I don't think it should depreciate.

The Master: Isn't the sum and substance of it that whether you are re-ballasting or not will add to the value of the road, depends on whether the re-ballasting is needed or not?

A. Yes, and also the fact that the re-ballasting is a continuous proposition, that there is some of it goes on every year.

The Wisconsin appraisal depreciated ballast.

From my information and investigation, I can say that the ballast on the South Shore has greatly improved since the Cooley appraisal, and since 1907. More or less work has been done every year, and the physical property of the company bears evidence of the fact that there has been a continual improvement in the way of extending the ballast, and putting St. Ignace ballast and stamp sand in territory that was formerly ballasted with other material. My personal opinion is that a very considerable mileage of plaintiff has been ballasted since 1900, and that the work has been so extensive as to amount to practically complete re-ballasting.

My recollection is that there were no charges, or very small charges, for ballasting, to capital. I made no attempt to adjust any of the charges as appearing on plaintiff's accounts between operating expenses or additions and betterments. There is a charge to additions and betterments for ballasting on the new double track, but, where they were re-ballasting or ballasting existing line, I remember having found no charge to construction or betterments due to ballasting. I went through the additions and betterments accounts for 10 years.

111 There were varying prices on contract work of the South Shore, for small jobs of from 4,000 to 14,000 yards in each contract: 1904, earth excavation, 26¢ per yard, and hard pan, 40¢ per yard; 1907, Mary Charlotte Mine, earth, 40¢, hard pan, 50¢, mine waste, 60¢, loose rock, 75¢, solid rock, $1.35, and overhaul, 2¢ per yard station of 100 feet, with 600 feet free haul; 1909, Volunteer Mine, earth, 35¢, hard pan, 50¢, and overhaul, 1.5¢ per yard station.

For Mr. Young's statement of cost of cut-off, he estimated 6,000 yards of rock and 154,000 yards of earth, with a total cost of $45,764.26, including both rock and earth, no separation being made. That price included charges for rental of equipment, supplies, and apparently all elements that go to make up the cost of the work; the cost was 27.5¢ or 28¢ per yard. The second track grading was done immediately after, by South Shore; the cost was $10,744.78, and I estimated the yardage by dividing the total cost by 30¢. Based on Young's price of 27.5¢, the yardage would go up a little. The $10,744.78 is simply the pay roll distribution, with no allowance for train service, rental of equipment, supplies, engineering or supervision.

In general, South Shore charges include nothing for engineering, supervision, or overhead expense on construction work, as they follow literally paragraph 15 of I. C. C. rules for additions and betterments, to the effect that no charge shall be made to additions and betterments for services of a general officer of the company or employee regularly engaged in other work and who gives but partial time to the particular work.

On ties, I figured percentage of condition at 60%, on inspection and my judgment as representing average condition of ties. I would say that the percentage of condition on South Shore ties is higher than 50%, without hesitation; I do not believe I have seen a

112 mile of main line road on South Shore where I would put the tie percentage as low as 50%. On tie life, I would take Young's experience here, or accept his judgment, because there is, or may be, quite a marked difference between the tie life here and in Lower Peninsula. On the supposition of tie life of 9 years and renewals on the basis of 11 years, as I figure it, the theoretical percentage would be below 50%, but I don't believe there is any main line mileage of the road in which the physical condition of the ties, as appearing from inspection, would be as low as 50%, and that certainly would not apply for an average.

My inspection was from moving trains, and, at points, where I got off to look at bridges, and in walking through yards. It is true that it is difficult, in going over a road on a train, to form an absolute opinion as to ties in the track for a long time; this and last year's ties can be picked out, but after two or three years it is difficult to distinguish from surface appearance.

Many ties that have been in the track for years are cracked, dirty, and appear to be in bad condition, but may be perfectly sound, and good for several years of service, while I have seen bright, nice looking ties that would not stand a hard blow without showing that they were affected by heart rot or otherwise. The section boss examines the tie he is to take out, carefully, and goes over his particular 5 or 6 miles, hundreds of times a year.

When I made inspection, all the renewals for the year were in; they are made in the spring, as a rule. Where a railroad is being ballasted extensively, tie renewals are super-normal, due to the fact that, in lifting the track for a 6 inch raise of ballast, it is necessary to take out ties that would be good for several years.

113 I do not remember that Young fixed 55% as his percentage of depreciation. He stated that in supporting the proposition that no tie in the track should be depreciated below 50%, because when it got to the point where it must be removed there was a new tie on the ground to renew it and the two, taken together, would be 55%. It is mathematically true, that where the cycle is being carried out, and if the life be 9 years, and renewals are made on the basis of 9 years, your would get a 50% condition; but, as a matter of actual condition, you would fix a higher percentage.

I spent more time in inspection than was spent by anyone in 1900 State appraisal. My inspection was much more thorough than was possible in 1900 appraisal, because of weather and inspection conditions, and I had the company records with me; I believe my inspection enabled me to place substantially accurate percentages. I think two competent engineers might vary, on the same inspection as I made, 10% or 15% on condition of rail; I do not think competent engineers would fall under my percentages. The variation might be 5% over or 5% under me; I think the variation would be up, rather than down. I should be surprised if you did not find quite a number of duplications in my work, and, in my mind, a detailed examination of the property will disclose omissions as numerous as the duplications.

On the cost of installing the switches, I think I have seen no en-

gineer's estimate at a less figure than $25, though I have seen them running to figures I considered excessive—$80, $90 and $100.

There is frequently variation in the estimates of engineers on labor items of railroad standard structures, such as switches, or installing crossings, or putting in highway crossings, or installing railroad crossings, due the different experience of different men in dif-
114 ferent conditions under which they have worked, that might cause figures 25% to 30% lower running to 25% to 30% higher than those I have used.

Q. That variation might extend further, it might extend into other railroad structures, might it not, small station houses, section hand houses, and these smaller structures that we find all along the road?

A. Yes, I think that that is true, that in arriving at a figure to represent a fair cost of reproduction of such structures an engineer will adopt one of two methods; he will either use some unit of square foot or cubic foot price, and apply that to buildings, or, to be more exact, he will measure up the material in the buildings and make detailed estimates, and, in either case, there is likely to be considerable variation.

Q. Even though the same method is pursued, the two different engineers would vary somewhat, at least so far as the labor items were concerned?

A. Yes, I don't think that variation would run so much in the case of labor items involving large amounts of timber, where prices of $8 to $10 a thousand are used, based on a wide range of experience, but on minor structures, such as hand car houses, or oil houses, or pumping stations, there might be a very considerable variation in an estimate, and, equally so, there might be a very considerable variation in the actual labor cost of two similar buildings.

I think that if it were possible to take the time for another appraisal, and go into minute details, it might be possible to still further eliminate or reduce the contingency item, on some of the schedules. I continued certain of the items of overhead charges without depreciation, because they are legitimate, proper and neces-
115 sary expenses that any railroad must incur in the original construction of its property. It is likewise necessary to incur the expense represented by the difference between my present physical value and fair present reproduction columns to reproduce the property; to reproduce the property, they must make an expenditure equal to the cost new of the elements.

I added 2% for engineering on equipment, which was not added in Cooley appraisal, where no allowance for engineering of any character was made on equipment. A considerable portion of the expense of engineering on equipment finds its way into the operating expenses. So long as the equipment continues in existence, the item of engineering would continue without depreciation.

For legal expenses, I used the percentage almost universally used in railway appraisal work. For several years, I have been securing data on all classes of construction work, and I find the item has a wide range, depending on the character of the property and its location; from data apparently reliable I find the percentage to range

from .38% to over 4%. I have not found complete and satisfactory records of new railroad construction that would enable me to say anything higher than .5% would be proper, though I have found them running from slightly less than .5% to over 1%, since promulgation of the I. C. C. rules. The item is incapable of absolute determination, being in the same class as engineering; it does not include costs of right of way purchases; that is something additional, which inheres in value of right of way.

In all of Cooley's appraisals, he has used 4% for engineering and .5% for legal expenses, and Wisconsin, Minnesota and South Dakota used 4.5% for engineering and legal expenses, while Wash-
116 ington, on Nothern Pacific, used 5% for engineering and 1% for legal, and, on Great Northern, 3.5% for engineering and 1% for legal; Nebraska used .5% for legal. Other appraisals have used a higher percentage, though I cannot say just what it is. Wisconsin, Minnesota, South Dakota, Washington, and Mr. Hogeland for railroads in Nebraska, have followed Cooley precedent, and applied legal percentage to roadway and structures items, excluding equipment. Mr. Hogeland, on C. & N. W., used .5% for legal, as applicable to all expenses. I have assumed four years of construction of South Shore, and allowed $21,000 plus per year for legal expenses.

Legal expenses would consist of the services of attorneys in connection with the organization of the property, the incorporation of the property, the services of attorneys, and law expenses, in connection with the construction of the property, beginning from the inception of the project, to the final completion, involving all legal services in connection with contracts for construction, contracts for purchase.

There is more law business connected with a railroad after than during construction. The ordinary property of this class spends, annually, a large sum, and in case of large properties there is infinitely more money expended per annum, in connection with the operation of the property, than there is in any year during construction. Those items during construction would be, first, as on every property, a considerable amount of legal service in connection with personal injury suits and with damages to property due to fire and wreck, to loss of property due to shipment of goods, etc. There is a very considerable amount of the time of the legal department taken up in connection with the matters of taxation and the various relations of the corporation and the State, and also a very considerable amount of
117 time given to itercorporate relations between the different railroad companies, matters of passing upon the validity of various contracts and agreements; also prescribing forms in the relations with Interstate Commerce Commission and State Railroad Commission, and in relations with their own security holders. In some cases, the legal expenses would be much higher than .5%.

Q. If it were indicated that the disbursements of the South Shore for a single year—say 1910—for legal expenses in Michigan had been $5,174, and that that is about the high mark, it doesn't go much above that, wouldn't you think it a possibility that you may have gotten your percentage a little high for this particular local condition?

A. No, assuming the correctness of that figure, it would indicate rather exceptional freedom from trouble in operation, but I cannot conceive of any condition so favorable as to permit the building of a railroad across the state, and involving a total expenditure of 15 to 20 millions of dollars, where it would be possible to get out for less than $85,000 during construction of the railroad, especially during the period of grading and track laying. My own experience has been that it required the almost constant attendance of attorneys, to adjust the difficulties that arose with adjoining land owners, the owners of property in the city, and with other railroads, due to the upsetting of conditions that formerly existed, the interference with other classes of business.

I do not suppose it would be possible to ascertain the real cost for legal services in construction of this line. Following out my theory of .5% applicable to the whole property, I would not expect to find any material increase in legal expenses in the expenditure of a large sum for building an ore dock; I do not think, following out my
118 theory, that, when ore dock No. 5 was constructed, the legal expenses should have jumped to .5% on the cost of that ore dock, as the expenses due to fixing the right to build on that location, securing establishment of harbor line, and settling disputes with adjacent property owners was all incurred at a prior time, and this dock was a replacement of the occupied site of ore dock No. 3. In large measure, the rights to build and maintain an ore dock on that location were, and are today, established, so far as the site of ore dock No. 1 is concerned.

I would not imagine there would be very much legal expense in connection with installing a particular dock that would require legal services—possibly, the approval of some contracts. My percentage is .5% upon the entire cost, and is not assignable definitely to any ore dock, depot building or particularly heavy mile of grading. If the ore dock had not been built, the amount would have been less, but I am of the opinion that percentage method is as fair a method as is possible to arrive at these elements of cost. Assuming ore dock No. 5 was not there, it would affect my figures $2,480, less figure placed on dock No. 3. In the event of the building of a new dock, I would not expect the legal expenses to go up in that proportion, as the rights of the company had been established by the expenditure years ago.

In the year, recently, when they bought, say, a half million of equipment, it would be difficult to say whether legal expenses ought to have risen appreciably in that year, as it is difficult to attach any part of the legal or general expenses to a particular group of items, or to determine how much legal or general expense is properly assignable to those items.

When equipment is added, on my method of computation, for the purpose of appraisal, the value of the total property goes up so as to
119 include .5% of the value of the equipment for legal expenses; I have no doubt that the general expenses of the property, as charged to operating expenses, go up.

Q. Why not the legal expenses, then?

A. I cannot say; I don't know anything about the work of the legal

department. I never have made any analysis, and never have noticed the legal item over a period of years, but this is a fact, in every railroad, that there are a large number of employees whose entire activity is devoted to the creating of new properties, the replacement, additions and betterments, whose services wouldn't be needed by the company if the company were not growing and increasing its facilities. The cost of their services goes into operating expenses.

If the company is increasing its property from year to year, say at the rate of a million a year, as is the case with some of the companies, that very fact causes an addition of general offices and clerks, and of employees and of traveling expenses, that directly have to do with this increase of property value. In order to determine the amount of money that goes into the property properly, all of those items should be divided, and then he devote one-half of his time to the building of an addition to the property, his time should be prorated, if you are going to arrive at the actual cost of the new property, but under the I. C. C. classification that is forbidden, so that it results in an increase of operating expenses. If his time was prorated, you could then get a more true figure of the actual cost of the additional property.

The services of employees would be charged entirely to operating expenses, unless the employees were specifically on that construction work all the time.

120 The Michigan 1900 appraisal used 3% for interest, assuming a rate of 6% per annum, and a period of construction of one year. In Minnesota State appraisal, a flat percentage of 4% was applied. I cannot say that I have included something like 20% by named percentages for what was included in Chicago Traction valuation at about 10%. The total of Chicago overhead percentage ran to something like 17% or 18%.

I added in this appraisal for interest on equipment. The interest which is actually paid on equipment would be but a small percentage, due to the short time before completion that the equipment comes to the line; but other items, such as land, grading, and track construction, are in place much more than one-half the time allowed as the time of construction. My percentage is an average.

A three year actual construction period would be required on South Shore, and four years from commencement of incorporation would be necessary; it would be possible to put any part into operation so as to materially decrease interest. The assumption of the Cooley appraisal, that all the railroads of the state, constructed in sections, could be completed within a year, was a violent one, and entirely erroneous. I don't think 3% for interest represented the judgment of the engineers on the work; few of them had given much thought to the subject, or had had to do with organization and financing of properties. I know of no railroad or system built and put into operation inside of a year. I was engaged nearly 4 years in building 23 miles.

The shortest time of construction I know of was the Santa Fe extension from Kansas City to Chicago, 440 miles, in 3.5 years from when they began buying right of way. I constructed 100 miles in Iowa in 13 months actual working time. I don't know about

121 the time taken, there, in organizing and financing. This property would take at least one year in financing and getting right of way.

On 12 or 15 miles, Marquette to Ishpeming and Negaunee, assuming construction of main line, mine branches and docks, to make property available for earning, 3 years is a reasonable estimate. There, the land and grading would be expensive. They could begin to earn revenues in 3 years. In my computations, I have used a 3 year period, but, upon the whole line, a year would be taken in work preliminary to construction.

I accepted Delf's figure of $240,000 as working capital and bills receivable. I think he deducts accounts payable; I told him that was my practice. I do not know as he actually deducted those.

Ordinarily, no fund is created out of capital for stores and supplies. Material on hand at the end of construction appears in stores and supplies.

A road reaches a seasoned condition in about 12 years. The first two or three or four years of the life of a new property, if that property was a passenger road, there would be considerable heavier expenses due to the seasoning of the roadbed, the settlement of the embankments, the washing down of the new slopes and cuts; there would be less expense in the way of renewal of ties, rails, etc. There should be no tie renewal, except to take the place of those that were broken. At the end of 7 or 8 years, the tie renewals would be heavy—perhaps above normal.

122 My percentage for contingencies averages 7.9% on items 1 to 36, varying from 5% to 10%. On construction items, my overhead percentages aggregate an average of 21.9%; on equipment, 19.9%. As certain percentages are figured upon certain of the previous percentages, the overhead is 22.8% of the physical schedules and 18.1% of the grand total of the value for Michigan. Overhead percentages allowed in other appraisals are:

Name of appraisal.	Engineering and legal.	Interest.	Contingency.	Organization or general.	Total.
S. Dakota, 1909.....	4.5	3.0	5.5	1.0	14.0
Gillette, Wash., Nor. Pacific	6.0	5.0	...	...	....
Wisconsin, 1903	4.5	3.0	5.5	1.5	14.5
Wisconsin, 1908	4.5	3.0	5.5	1.0	13.5
Morgan, Minnesota	...	...	5.0	...	....
Darling, Nor. Pac.....	...	...	10.0	...	....
Berry	...	...	10.0	...	....
Hogeland, Nor. Pac.....	...	...	10.0	...	....
Cutler, Minn. & St. L.....	...	...	5.0	...	....

I have not made computations that would show the exact percentage upon the total appraisal. Some of these items were not applied to all items of the schedule. In recent years, Wisconsin has, in a number of appraisals, used a flat overhead of 13% or 13.5%

I have endeavored to make a careful investigation of South Shore; I have been handicapped by lack of time and inefficient records, but I believe my report reasonably free from error. I believe I

have spent more time and gone into more detail than was done on any of the Michigan valuations. I had full co-operation of the railroad and its officers, and full access to its records. My inventory, in many regards, is more complete than the company ever had before.

123 On grading and some of the other schedules, as buildings and structures, it would be possible by a re-survey to make a more accurate inventory than I have made.

My attempt was to make as complete an inventory as time would permit, and furnish as accurate a valuation as it was possible to furnish at the expenditure of a reasonable amount of money. A re-survey of the road could not have been made at an expense under $60 to $70 per mile, which I did not feel justified; such survey, while not capable of giving exact figures, would have disclosed substantially correct figures, and obviated the necessity for use of estimated yards per mile in sidetracks and other points. It would not obviate the use of estimated figures, to take care of overhaul and some other items.

So far as the contingency element applies to the items of difficult construction, bad foundations, expense due to construction in the winter, or weather conditions, or delays to traffic on account of construction or high unit prices by reason of causes that are not now capable of determination, it still leaves a large element of contingencies, and I think that it is unquestionably true that it is fully as difficult, if not more difficult, to arrive at a correct inventory and an accurate estimate of existing property, that has been in existence for many years, than it is to make an estimate of the cost of several hundred miles of standard construction where surveys have been made.

Allowance for contingencies was intended to cover (*a*) error of inventory, (*b*) cost due to difficult construction, and (*c*) cost due to weather conditions, all of which are in South Shore in as large a measure as in property about to be built. I have never known a case where cost of construction did not run in excess of estimated cost as a whole, and I always allow liberally for contingencies.

124 I have endeavored to eliminate all elements of contingencies from the detail of my schedule, except where, in earthwork, I used the Cooley figures as a basis, and there I have added percentages. I think the figures I have given for earthwork actually under quantities that would be disclosed by re-survey. On particular structures, my experience has been that, when work was finished, some of my structures have underrun and some overrun the estimate 10%.

An engineer may make the most careful estimates on the actual physical construction and be substantially correct, and he may carry out that work, and often engineers do carry out work and get comfortably within their estimate of the cost of doing the physical, but other items entirely outside of their control come in on every job, to a greater or less extent; that must be classed as a contingency charge.

Other items of contingency would — extra expense due to (*d*)

demurrage, (*e*) material yard charges, (*f*) strikes and labor troubles, (*g*) securing labor, and (*h*) change of plans.

My article, read before the American Society of Civil Engineers in January, 1911, comprised my views at that time. This article contained the following:

"The Charge of Ten Per Cent. for Contingencies.—Perhaps no single feature of the Michigan appraisal of physical property has been so generally criticised as the charge of 10% of the entire estimated cost, including all the percentage charges, to cover 'contingencies.'

"At the time the first appraisal was made, the writer was not at all satisfied that such an item, in such amount, should be included. The reasons advanced were so strong that it was done, and the writer's subsequent work has fully convinced him that it was proper and justifiable, because:

(*a*) The conditions under which this particular inventory and appraisal were made, as to time and lack of co-operation of the companies, made it practically certain that some items of
125 value were missed in the appraisal, such as station and miscellaneous equipment, frogs, switches, track structures, buildings owned by the companies and occupied by others, etc.

(*b*) That there were many and large elements of physical cost not ascertainable by a physical inspection, such as deep foundations, many thousands of yards of earth in swamps and sink holes (a very general condition of roads in Southern Peninsula), concealed classification due to growth of grass or washing of banks, and many other cases of work actually done, invisible after a lapse of years. The writer knows of many such instances on property which was in his charge many years ago; in several cases there were expenditures of from $20,000 to $50,000 which are now entirely invisible to an engineer passing over the line.

(*c*) The failure on the part of railroad companies to keep anything like a complete history of construction operations, and the changes of operating officials from year to year, cause the loss of record of practically all the expense due to extra hazard and risk which the construction engineer provides for by his 'contingencies.'

(*d*) The inclusion in operating expense, every year, of sums which are properly construction, and which, if added to unit prices of construction work, would cause the cry that such unit prices were too high. For instance, the appraisal estimate on earth was 17 cents per cu. yd., with no allowance for overhaul. Very much of the grade in the State had actual costs far in excess of this figure, and practically every road spends a large sum annually for the first four or five years, which is charged to operation but is in reality a part of the cost of completing the roadbed.

(*e*) No account was taken of appreciation of any of the elements entering into a road. There is no doubt that roadbed, for example, does appreciate, due to ballasting and track work. These items go far toward accounting for the contingencies item on an old road such as the Michigan Central.

(*f*) There is a considerable amount of cost, which cannot be taken

out of capital, where facilities are abandoned or line or grade changed. These changes are common to all growing roads; they are due to the demands for greater traffic; they are necessary to the welfare of the community served; they are often made at points where no charge of defective design will apply. They might be termed expenses due to the development of the State, and, in the development of the railroad business, they were absolutely necessary for its present standard of efficiency. They are incapable of exact and definite determination, and must of necessity be included as contingent expenses.

126 "In the case of a new road, where the exact cost is ascertainable, the records have been fully kept, the original plans are on file, and the history is fresh in the minds of the officials, it will be readily admitted that a charge for contingencies in large amount would not be justifiable; but, in the case of the Michigan Central Railroad, a line more than 50 years old, which has changed, rebuilt, and added largely to its property; in the case of the Pere Marquette Railroad, made up of the union of a dozen lesser properties, without any complete history; in the case of dozens of little lines, without maps, profiles, or records, some such allowance is fully justified and proper.

"The experience of the writer, in the years that have passed since these appraisals, leads him to the opinion that the difficulty of estimating values of an old property are such that in many cases an appraiser might add, with perfect propriety, even more than 10% for the contingency item.

"In computing overhead charges, no allowance was made for working capital, and no addition to the physical valuation was made to cover any such element as 'going concern' value."

I fail to see where it can be said that there is any greater value to the public by reason of the fact that, in the course of railroad construction, strikes occur, or delays to material, or even damages by reason of storm or wash-out; but, in the building of every property, expenses of those kinds and of similar nature are incurred, and the men who are putting the money into the property, to create the property, are compelled to furnish that money and invest it in the property, and it appears to be a properly chargeable expense incident to construction, and to be properly a part of the capital.

The strike and delay, involving demurrage charge and a dozen other items, are misfortunes that are incident to the building of railroads, and, no matter how carefully the organization may have been planned, they are bound to come in, in some form or other, to a greater or less extent, before you get your railroad built; you cannot avoid spending money—more money than you ought to spend,

127 perhaps—for items of that sort, that are in the nature of a misfortune. A strike is a possibility; certain other elements of contingencies are probabilities.

In theory, my item of real estate and right of way includes original cost, additional percentage, and the cost of purchase. The items are fully described in my inventory. I know of no further acreage that should be included. As bearing upon the question of whether

contingency items should be allowed upon the real estate, the contingency item is not assignable to the individual items, nor in the same degree on all items, but is a proper allowance on the whole appraisal. On real estate, a contingency due to the judgment of different men in fixing values must properly be added. If I were making estimate for the purchase of right of way of 6,000 acres, I would, after fixing my values with the utmost care, add a large contingency item.

On real estate values, there is likely to be a wide range of opinion, up and down. It is substantially impossible to separate the contingency item and apply it to the different schedules; it is much greater on some classes of work than the 5% or 10% I have figured, and the effect of its being smaller on some would make a much heavier percentage on others, assuming it were apportioned.

If you undertake to apportion contingency among various items, you must, on some, use a very large percentage, far in excess of anything that has been named; and, over and above all the individual schedules of physical property, are elements of cost that come in by reason of building the whole property, that are not assignable to any of the schedules.

Contingencies on my valuation, figured on Cooley basis, would be approximately $545,000 more than I have allowed; I have
128 allowed $1,196,460. Contingency on my totals, on Cooley basis, must be $1,744,502, and he allowed, in 1900, $1,029,845, and in 1905, $1,110,614. My figures were based upon increased prices and additional property.

All of my prices were proper for 1911, and were in no sense (with small exception) the average of a period of years. My labor prices were figured as of 1911, and grading at 30¢ was a 20% increase over Cooley 1900 prices, and very closely approximates increase in wages of 1911 over 1900. It would have been a fair price as of 1909 and 1910. On grading, I did not attempt to make a mathematical computation from any year's figures. I had contracts of 1907, 1908 and 1909, and knowledge of contract prices of 1910 and 1911.

I made no special examination of the company records for unit costs on buildings, as I found the company had not included in their costs, as reported in their additions and betterments, items of transportation of men and materials and numerous other charges that properly should have been made against buildings. In a great many of the buildings, there are omissions of quite considerable items, and the accounts, as made up, report the actual price of material, without any of the cost of handling or transportation, plus the actual labor cost of men working on the buildings.

I have no doubt that in many of the older buildings the original cost was materially less than my cost of reproduction, and in many cases it might be found that the present physical value is equal to, or in excess of, the original cost. In the last few years, since additions and betterments accounts have been kept, new buildings and replacements have been kept separate, and many are shown in company's additions and betterments accounts. For those, I could get a figure that purported to be original cost, while others show widely

different cost, due to omission of items undoubtedly charged
129 to operation instead of construction. Within my experience in this state, there have been no such sudden or violent fluctuations up or down as would materially affect the cost of the entire property. There has been a steady tendency, in the past 20 years, for prices to go up; there have not been violent fluctuations in that period in any class of material entering largely into permanent way, with certain exceptions.

In structures, obsolescence was taken into account by me to a limited extent only. That is, where a structure built for a superior purpose is now used for an inferior purpose, it was included at the present value for its present use. That applies only to a limited number of minor structures; other than that, I did not take into account, or use, obsolescence in figuring my rates of depreciation.

I have not taken it into account, in any appreciable extent, in bridges, although it might possibly be argued that there was an element of obsolescence there. As long as it is doing the work, in a satisfactory manner, of an up-to-date structure, that would take its place at a greatly increased price, and without excessive maintenance, I do not believe that a company should be compelled to throw into the scrap heap a bridge or other structure and replace it by something more expensive.

In many of the structures, there is no obsolescence. Some structures, such as wooden bridges, can be maintained safely indefinitely and held to 50% condition by replacements; they can be held, by reason of annual maintenance charges, in condition of, substantially, 50%, year after year, and I do not see how an engineer is justified in placing a lower percentage of condition or value because it would be nicer to use a different character of structure.

130 The capacity or strength of some of their old iron bridges is limited, and some of the old wooden bridges could be strengthened for increased locomotive weights and cars with very little money. Most of South Shore bridges are of a type that we would not rebuild today, if we were to build the road new, as they are much more expensive than they were when originally built; and, in the case of many of the smaller ones, the expense of putting in a re-inforced concrete slab, or an arch, would not be in excess of the cost of replacing in kind, or building new, and, to that extent, they are obsolete. They are a form of bridge that was used on practically all the pioneer railroads of the west, a few years ago.

I don't know that I would continue to maintain those structures indefinitely; you reach a point with some of them where the annual maintenance would probably justify new construction. This is not due so much to obsolescence of the type as to the fact that lumber and labor costs have gone up, and having such a bridge involves taking out and replacing members every year.

I have not, in any case, ignored the structure in existence, or depreciated it beyond average depreciation of that class, because some other type of construction might be more economical of maintenance, or might be installed to perform the work equally well, at less cost.

I had recourse to very few sales in Marquette, and my judgment

was fixed, in the main, by inquiry, as to asking prices, value and sales, supplemented by examination of the property, by the values of frontages as given in the Cooley appraisal, which were carefully made by a special appraiser. My highest price for frontage, except on the main street, is $60 per foot. I had no sales on Front St. from which to fix value of $450 per foot.

131 On south line, two tracts are crossed by the railroad, and I included about 13.7 acres; I should say that the purchase of the entire of both pieces would be necessary in building the right of way across the two tracts, and that the payment of abutting damages would more than equal the value that I have placed upon the entire land. This property is so cut, and left in such shape, as to be in the class where the railroad company would be compelled to purchase the whole, as the cheapest way out. There are about ten acres outside the right of way, divided into three triangles.

On water front, I had information as to the asking price on three or four pieces of water front property, one piece near Standard Oil and one around beyond L. S. & I. depot; I do not recall that I heard of any sales in a number of years.

Spring St. produced is used as a driveway or approach to the ore dock, and by the general public, and by employees of the company. If I had known that the company had reported that 40 feet at $1,100, I do not think I would have used it or been guided by it in placing values at Marquette. (Witness' value, $20,000.) While not used as a right of way for track, it is used as a thoroughfare. There is no public street through there, and I would say that it is essential to the company's business to have one. It makes the lowest grade approach from Lake St. to Front St.

My information is to the effect that it was vacated and the company acquired it. I don't think it would have made any difference in the value of my land at North Marquette, at $200 per acre, had I known that the company, in its sworn report, fixed a price of $700 for 22.29 acres there. Water front in Marquette is used by Standard Oil Co. and a number of industries located on South Shore tracks;

132 I know of no other considerable uses. There are more or less fishing boats and minor boats, but nothing that would be considered a use of the water for docks, wharves and other improvements.

Q. (South Shore occupies, according to witness' figures, 4,150 feet of water front.) Assume taking away this railroad and its structures, leaving nothing on water front but Standard Oil, using a small parcel, and small industries mentioned as connected with railroad and serving railroad purposes; what demand would there be to fix any value for this water front, at your figure?

A. The availability of this land for ore dock purposes, and the fact that it can be reached by direct line, would, in my judgment, bring it on the market for railroad purposes within a short time. The fact that it is now occupied by a railroad, shutting off access of other railroads, is a controlling factor in *their* having been no other sales in the vicinity. Remove the condition now limiting the

availability and use of Marquette water front, and the most valuable water front property in Marquette would be put back on the market, and, with two other railroads reaching this city, as now, it would not stay on the market very long. Its peculiar adaptability to transfer ore from cars to boats, and its location, on an improved harbor and in immediate business center of best city in Upper Peninsula, are elements which give it a real value.

133 On November 7, 1912.

RIGGS, recalled by plaintiff.

Further direct examination.

By Mr. Butler:

Complt.'s Ex. 49, Riggs, is an apportionment of property between the different classes of service—freight, passenger and common or joint.

The main line and second track mileage was allocated to joint freight and passenger, and is so used, except from Humboldt to Republic and from Bessemer Jct. to Bessemer, which is not operated regularly by passenger trains. That was included in common property. Branches, amounting to 54.87 miles, were assigned to freight. Passenger car storage tracks and tracks used for washing passenger cars were assigned to passenger. Main line passing tracks, and those leading to shops and roundhouses, were assigned jointly, as common. The great majority of sidetracks, being to freight houses, spurs to mines and industries, tracks to ore docks and mines, and for storage of freight cars, were assigned to freight.

The separate schedules of Complt.'s Ex. 1, Riggs, pertaining to tracks were assigned as were the tracks on which the items occurred. Frogs and switches were divided in accordance with sidetrack schedule, switches to a track, if commonly used, being assigned to common service, and, if used in freight or passenger, being assigned according to the use. Exclusive freight buildings were assigned to freight, exclusive passenger buildings to passenger, and joint buildings to common.

Passenger-train equipment was assigned to passenger, and freight-train cars to freight. Miscellaneous equipment, such as snow plows and work equipment, was assigned to common. The ferries, steamships and locomotives have not been allocated, as many of the locomotives are not capable of definite location between passenger
134 and freight, the same locomotive being sometimes used to haul one class, and then the other. It might be possible for officers of the road, with complete information, to make a fairly definite allocation of locomotives. This would be difficult for one not familiar with the actual service. The records of each locomotive service might be examined, and fairly accurate allocation made. Some of the locomotives may have drawn mixed trains or handled short local passenger trains doing more or less work in switching. The mixed train mileage of the road is very small.

Terminals are allocated in the same manner as other properties. The International Bridge is used by both passenger and the freight services.

The overhead items, being percentage additions, were computed on the amounts apportioned to passenger, freight and common, so passenger service bears its percentage of them.

The results of Complt.'s Ex. 49, Riggs, show:

How assigned or allocated.	C. O. R.	P. P. V.
Passenger	$507,665	$377,133
Freight	5,557,099	4,184,647
Common	13,134,341	11,570,303
Common assigned to Passenger (48.28%)	6,341,260	5,586,142
Common assigned to Freight (51.72%)	6,793,081	5,984,161
Total Passenger	$6,848,925	$5,963,275
Total Freight	12,350,180	10,168,808

The common property has been assigned between the two classes of property on the basis of revenue train miles for 1911. The
135 revenue train mileage is all made on the main line and other tracks used for both freight and passenger trains. The switching mileage, made over main line tracks, spur tracks, and tracks not jointly used, does not go into revenue train mileage. Much switching mileage is done on tracks used in both departments. I am of the opinion that the revenue train mileage is a proper basis for apportionment, as the revenue train mile is the unit of operation, both freight and passenger, and the common property and its maintenance are affected about in proportion as the train mileage.

The heavier and larger units, made up of freight trains, have a certain effect in wear of rail and life of material, but that wear is due in large measure to the fact that curves are elevated for faster moving passenger trains. The larger number of sidetracks used as passing tracks are necessary, because of the more rapidly moving passenger train units, and it would be difficult to fix any definite amount of money or proportion of maintenance of the property assignable to the freight service and not in any way affected by passenger service.

The revenue train mile basis seems to me as fair as any, and gives substantially the same results as revenue locomotive mileage basis. I believe it more fair than car mile basis, as the locomotive has more effect upon the physical property than the passage of any individual car. It might be possible to use a car mile basis, a locomotive mile basis, or a revenue basis.

In my opinion, the same reasons support the propriety of the use of the train mileage basis for the division of maintenance of way and structures items of expense as for apportionment of value between the two classes. In it, weight is disregarded; the lighter pas-
136 senger train being given the same efficiency, as a factor of apportionment, as the heavier freight train. That seems to be fair, as the lighter passenger train requires certain forms of

construction and maintenance of track not used by slow moving freight trains.

The super-elevation of the outer rail on curves is very much greater for tracks used for passenger service than for those used for freight service. The elevation is increased as the train speed is increased; the track gauge is somewhat widened at curves, to permit the passage of wheels around the curve without binding. This increases the wear of the rail, as the elevation necessary for passenger movement is excessive for the freight train, and causes more grinding on the inner rail by freight cars and locomotives. This being necessary for, it is chargeable to, the passenger business.

Speed is an element to be taken into account, as well as weight. The passenger train has the right of way, and freight trains must take sidetracks, with considerable necessary delay, loss in time, fuel and wages, and use of sidings, traceable to the presence of passenger trains.

Both classes, to some extent, haul non-revenue company freight, like track material, fuel and supplies. The company car load freight, and a considerable part of its less than car load freight, is handled by freight trains; also, a very considerable amount of company freight and tools are normally handled on passenger trains, in baggage and express cars; that would be light—of relatively small tonnage. It would be more in the nature of emergency supplies and tools; it is a higher class of service, though tools and a large proportion of office supplies, stationery and smaller supplies are handled on passenger trains. The ton miles of company material handled on freight trains would be much greater than on passenger. In ton miles, the class of stuff hauled by passenger trains would, I think, be practically negligible.

137 The maintenance of way items are due to the use of the tracks and to weather and the elements. Some items, such as maintenance of roadbed, ties, timber, structures, etc., are assignable, in large measure or wholly, to weather conditions, while wear, renewal of rail, frogs, switches, and many structures, and repairs to track (meaning the whole track structure), are due, in large measure, to operation.

Renewal of ties would be necessary, whether track was used or not, and rail renewal is, in some measure, dependent on the action of the elements, but in greater measure on wear; a rail not in use would depreciate as rapidly as a rail in use. In Upper Peninsula, there is very little destruction of ties due to use; it is mostly due to weather and decay.

Expenditure in keeping banks and cuts in order is due to weather. In bridges and trestles, renewal is due to decay. There is in the latter more renewal assignable to use than in the case of ties, but, largely, renewal is due to decay. In culverts, grade crossings, fences, cattle guards and signs, the maintenance is due almost wholly to decay.

Removal of snow, maintenance of snow fences, snow sheds, etc., is due wholly to weather, as is the wooden part of telegraph and telephone lines. The maintenance of buildings, fixtures and grounds

is partly due to decay and partly to use. You cannot definitely assign as between passenger and freight, and it is due, in the main, to weather. Platforms at small country stations would be more affected by weather than by use, while at a busy freight house it is due to use more than to weather. The condition of platforms, as to safety, is required largely by passenger business.

The train mile is the ordinary unit of operation, the activities of the whole road being to move trains, whether consisting of
138 one or of many cars, and the passage of each train, large or small, is an exclusive use of a single line of railroad.

(Complt.'s Ex. 49, Riggs, offered in evidence.)

Complt.'s Ex. 50, Riggs, embodies modifications in Complt.'s Ex. 1, Riggs, made or indicated in direct and cross examination. This indicates a net reduction of reproduction cost of $46,551, and a net addition to present value of $16,618. The addition has not been affected by overhead percentages. Certain additions were made in land values. Deductions were made in the items, bridges, guard rail and spikes, switches, and shops, enginehouses and turntables, and the price of relayer rail in sidetrack was raised from $20 to $24 per ton.

There are no bridges or trestles on sidetracks, except a trestle at Waiska Bay, near Brimley, where the branch is allocated to freight. There are no station buildings or structures of any moment on branch lines. There are a few crossings and very inferior shanties. Exclusive freight buildings indicated on Complt.'s Ex. 49 are all on main line.

Compared with main line track, the track allocated to freight, in the main, receives a small amount of money for maintenance; also compared with main line, or with passing tracks adjacent to main line used by trains in operation. The branch lines are, in the main, reasonably well kept up, and safe for such movements as occur over them. The sidetracks are maintained about as such inferior sidetracks are usually maintained, in a safe condition for the occasional passing over them of trains and cars; and, when maintenance is done upon these tracks, it generally comes in the form of a fairly complete renewal of ties and a fairly complete re-surfacing of the track, and the maintenance is then permitted to accumulate.

139 The sidetrack rail is suitable for the purpose, and will not need renewal for an indefinite period. There is no ballast on these tracks, except sand, cinders or, occasionally, gravel of poor quality. I have considered ballast on sidetracks as earth surfacing, at the price per yard for grading. The tie renewals are much less frequent on such sidetracks than on main line—not that the life is longer, but the movement over them is not so frequent; they are slow switching movements, and they are not required to be kept in as safe condition as main line and passing track ties. The renewal of ties and re-surfacing comprises the principal part of maintenance of exclusive freight tracks.

RIGGS.

Recross-examination.

By Mr. Wykes:

I cannot give you the value of the 173.01 miles of track (corrected to 157.27 miles) assigned to freight, as it must be picked out of the various schedules; it is capable of separation. In property devoted exclusively to freight, I have not included Bessemer or Republic branches, where I think there is no passenger service at present; that has been true as to Bessemer branch for a longer period than 18 months, though on Republic branch passengers are carried on certain trains.

These are included as main line, as both are operated by regular freight trains. I am inclined to think that both should be classified as lines used for freight, and that, in making complete allocation, it might be more fair to include them with the freight tracks than with the joint property. It would be absolutely necessary to so treat the Bessemer branch. Bessemer branch does not carry passengers; Republic branch does. There are no purely pas-
140 senger trains on Republic branch; the passenger business done there is either on freight or mixed trains.

The revenue train mileage is entirely computed on the main line tracks which are assigned to joint freight and passenger; none of the mileage entering into revenue train mileage basis would be made on the 173.01 (corrected to 157.27) miles assigned to freight.

Q. But the expenses, assuming a division of the expenses upon the revenue train mileage basis, the expenses arising upon this 173.01 (157.27) miles would be divided between the two departments upon the basis of revenue train miles made on other parts of the line?

A. I don't know that I have the question. I do not understand that I have testified as to a division of operating expenses; I understand the question to be aimed at operating expenses.

Q. Yes, if you have not, I misunderstood both Mr. Butler's questions and your answers. If you are willing to limit the replies that you have already made so that it will not include operating expenses, I will withdraw this question.

Mr. Butler: I think the question related to the operating expenses, the maintenance of way over which the mileage was made. I did not speak of my memory, but I intended to simply take the opinion of the witness as to the propriety of that factor for the division of the maintenance of the common property over which the passenger and freight train miles used as the factor were made.

A. I don't know that I could testify fully as to the matter of operating expenses. For example, the delivery of a freight train, a train load of ore from Ishpeming or Negaunee to Marquette would certainly include the expense of placing that train either
141 upon one of the sidetracks in the storage yard or, possibly in some instances, upon the docks themselves, and, in going into operating expenses, you have the extremely difficult matter of

undertaking to make separation as to just where the switching movement leaves off and where the expense of the road movement begins. A number of elements come into a computation or distribution of operating expenses that I do not feel qualified to testify upon at all, as I have not gone into the question of either earnings or operating expenses in this case.

Q. Do I understand you, then, to testify that the train revenue mileage basis is proper for the distribution of the expenses?

A. I testified that in my judgment the revenue train mileage basis was a proper basis for the apportionment of values as I have attempted to do in Ex. 49. I do not remember having testified with regard to that basis, or any other basis, in the manner of apportionment of expenses.

Q. If you addressed yourself to a division of the property, and not to a division of the expenses, in your testimony, why was it necessary, this morning, for you to weigh the considerations which made up for the relative expense in the freight and the passenger departments, as you did at some length?

A. My testimony this morning was directed wholly at the one item—maintenance of roadway—and it seems to me that what I said this morning regarding the effect of the passenger train movement and the freight train movement over the road, as it relates to that one item, was proper, as showing why, in my judgment, equal weight should be given to the freight and passenger train mile.

Q. And that testimony was based upon the propriety of the use of the revenue train mileage basis for the division of expenses, was it not?

142 A. Primarily as showing that the passenger train mile and the freight train mile were proper for a division of property and, I think for that particular item, for division of expense.

The question of a division of the property between passenger and freight came up early in my work. I got the idea of the revenue train mile basis after consideration of several basis; in my judgment, that was the most proper. The revenue train mile is a unit often used in railway accounts and statistics. Independent of where it may have been used for division of the common property, it seems to me it is a fair and proper unit.

I would say that I got that basis on a result of a series of conferences with my associates and with Mr. Delf, and others, and I decided to use it because, in my judgment, it has appealed to me as the proper basis. I know of no instance where it has been used in the allocation of property. I don't know that it is the fact that this particular basis assigned to the passenger a larger amount of property than any other basis that can be selected; I am unable to answer you as to that, in full. It does throw into the passenger department more than some of the other bases—I think more than the revenue basis.

Q. Now, I have understood you to say that in the distribution of the items of maintenance of way and structures between the passenger and freight departments the use of the revenue train mileage

basis is approved by you, or do you say now that you don't care to testify on that?

A. I did not, I think, in my testimony undertake to say that that or any other basis was most proper for a distribution of operating expenses, and I merely referred to those items of maintenance of way which were affected by freight movements and passenger movements as being an argument to support the contention that the freight train mile and the passenger train mile were entitled to equal weight in the division of property.

143

It is difficult to fix a definite percentage of repairs and renewals of ties due to train movements or to weather. That has been attempted by engineers, but the opinion of engineers differs, and percentages vary. It also varies on each of the different items entering into maintenance of way. On ties, the greater part of the expense is due to weather and decay, but to say whether that is 70%, 80% or 85% would be difficult, and a matter of opinion. Engineers have undertaken to make such an estimate; I think they ranged between the percentages that I have used—70% to 90%, weather. On rails, the larger percentage of depreciation is due to wear. Any work which has to be done on the grading, cuts or fills, due to settlement and washing of the slope, is chargeable almost wholly to weather.

The surfacing, once done, is by no means finished; it is a continuous operation, and a large part of the charge of repairs to roadway and track is the continual re-surfacing and maintenance of line and track to grade. That is due, in the main, to operation. A re-surfacing of the entire road is necessary every year, and the section men are continually at work, re-surfacing. The expense of maintenance of way and structures is due to two considerations, one of which is train movement.

Q. Now, if the train movement were equal in weight,—that is, if the movement of the unit in each instance were of equal wear on the track, and equally expensive,—it would be unquestionably proper to divide that part of the expense that is due to train movement on that basis, would it not?

144

A. Yes, if you could conceive exact equality——

Q. If it were equal, but we have the situation of dividing the expense of maintenance which — due to train movement upon a revenue train mile in the passenger department as against a revenue train mile in the freight department, if we use the train mileage basis; that is true, isn't it?

A. Yes.

Q. And those two things do not represent the same thing, do they?

A. They do not represent the same thing exactly, in that you may have a train movement in your freight department varying all the way from a locomotive with a caboose up to a locomotive with a long and very heavy freight train, several times heavier than the weight of your passenger train; but, in each case, you have with that train mile unit the locomotive; the wear upon your track and track structures crossed by your locomotive is much heavier than the wear caused by the passing over of any number of wheels of your freight cars or your passenger cars.

The Master: Isn't the wear by a freight locomotive much greater than by a passenger locomotive?

A. Not necessarily. That will depend upon the character of locomotives in the service upon the road. Where your passenger locomotive approximates or equals your freight locomotive in weight, as many of them do, your wear from your passenger locomotive is heavier and your passenger locomotive is running at a much higher rate of speed than your freight locomotive.

The Master: Does it make much difference with the wear, whether the locomotive is drawing a very heavy train or not?

A. It is a very difficult matter to analyze the wear upon your tracks. A freight train on a grade, drawing a very heavy
145 train and moving slowly, will cause more damage to your track in going around a curve than a passenger train followed by a light load moving at a high rate of speed, and that, in a measure, is chargeable to the fact that your curves must be elevated for your high speed passenger trains beyond the elevation that is required for your slow moving freight locomotive, that is drawing its maximum tonnage.

Q. Now, I think, Mr. Riggs, that we are agreed to this point, that the passenger train mile is not the absolute equal in cost of the freight train mile, in cost of maintenance of way. That is, the variation of cost may be on one side or on the other—we are not saying which, now—but the cost of a passenger mile, to maintain that right of way, is not the same as a freight mile; we are agreed to that point?

A. I think I will say that the two are not exactly equivalent, any more than with all freight train miles, that freight train miles made by one train are the exact equivalent of the freight train miles made by another freight train. It is very difficult to tell just what weight should be given to the freight train mile in the matter of expense,—for example, on a single track road,—for the reason that some of the expense of the freight train that is, in the ordinary course of accounting, charged to the cost of a freight movement, is directly traceable to the fact that the road is a passenger road and the expense is made necessary by passenger movements over the road.

The Master: Could you say that one is greater than the other, and, if so, which?

A. Well, as far as the effect upon the maintenance is concerned, I don't know that I would undertake to say that one was greater than the other; either might be greater or might be less.

The Master: But the difference—could you give any idea between what points the difference would vary?

146 A. That would be a very difficult thing to do; your honor.

The Master: Would they vary very much?

A. The freight train mile of the freight train is generally heavy and longer train than a passenger.

The Master: Would they vary 10%?

A. They might vary much more than that.

The Master: I mean between freight and passenger; not between different freight trains?

A. Yes, I would say there might be a greater difference than that.

The Master: But you couldn't tell which would be the greater?

A. No; I am inclined to think that in the effect upon the water of the road, upon a single track line, the train mile should be given about equal weight; that is my judgment.

Q. That is the only judgment that will permit the use of them for the division of common expenses, is it not—that they should be given equal weight?

A. Yes.

Q. If they shouldn't be given equal weight, then you must abandon them as the purpose of the division of common expenses?

A. Yes.

The Master: Would you have to abandon them if you could determine the ratio; why couldn't you take the ratio, and make it the purpose?

A. If it were possible to determine the ratio, it might be taken as a basis.

Q. But they are two different things, are they not; one is a freight, we will say, of 22 cars, and a locomotive and a caboose, and the
147 other is a train made up of three and three-quarters cars and a locomotive, and you are saying, in the use of your revenue train mileage basis, that one of those, in the wear of the track, is the equivalent of the other, and, yet, they are two different things?

A. I do not know; I do not think that I have in mind, now, figures as to the average train.

Q. I have given you about the ratio; it may be four instead of three and three-quarters, for the passenger?

A. In the one case you have a train that is made up of a larger number of cars, some of which are loaded, some of which are empty, and some of which are light, with a light caboose, moving at slow speed; in the other case you have a train varying from three to six or seven cars, with a locomotive substantially equivalent in weight to the freight, with cars that are longer and heavier, with a very much higher rate of speed.

The Master: Could you give any idea what part of the wear of those two trains comes from the locomotive, and what from the cars?

A. Well, I haven't gone into that, your honor, at all. The greater part of the wear of the train is due to the locomotive. As I said this morning, I haven't gone into the question of the weights of locomotives used in the various classes of service on D. S. S. & A. Some of the heaviest locomotives they have—some of the heavier and more modern locomotives—are used in passenger service, and some of their older and lighter locomotives are used in freight.

The Master: Assuming they are the same weight, can you form any idea as to whether this freight train, of 22 cars, would cause any greater wear on the track than a train of four passenger cars?

A. The high speed passenger train would cause more wear, or would be apt to cause more displacement.

148 The Master: I mean now the cars, supposing the engines are the same weight?

A. I don't know that I can answer that, your honor.

The Master: What I was getting at was this: If the locomotives

are the same weight, and have the same effect upon the track, would there be any considerable difference between the two trains with regard to the cars?

A. I don't think there would be any appreciable difference, and I think that the rate of speed in one case would tend to offset the greater number of blows given to the track by reason of larger number of wheels in the other train.

Q. When you say there wouldn't be any appreciable difference, you mean to weigh on each side all of the elements that make for wear of the track?

A. Yes.

Q. Against all of the elements that make for the wear of the track on the other side.

A. Yes.

Q. You wish to say that, taking into account the weight, the speed, the starting and stopping, and all of those things, the train mile in one department is about the equal of the other? But you don't mean to answer, that there is no more wear from the 22 freight cars than there would be from three or four passengers cars, excluding all other elements?

A. I think, taking that question as a whole, I would answer the first part of it, yes, and the second part. no.

Q. Now, there are conditions and things attendant upon the movement of a passenger train which make that movement more
149 expensive than the movement of a freight train, even though the freight train has more cars, are there not?

A. Yes.

Q. The speed that you mention is just one example on that side. There are on the other side things which make the movement of the freight train more expensive on that side of the proposition?

A. You have reference, now, to the effect upon the track, or cost of operation of the train itself?

Q. I have reference to the entire wear due to the train movement, the thing that you have testified, maintenance of way?

A. Yes.

Q. Now, there is no way, is there, that we can with certainty determine what proportion of the cost is due to the speed in the passenger department—how much that increases the maintenance of way expense attributable to that department?

A. I do not believe that it would be possible to give exact value in this case to the speed, or to the weight in the freight department, or to the pounding of an extra number of wheels in the freight department, without a very careful study of local operating conditions over a period of time; I would not undertake to fix any value to those elements without access to a very large amount of information not obtainable, and I do not know that, even having it, I would undertake to do so.

Q. Do you know of anyone who has ever undertaken that?

A. No.

Q. Isn't it true that, in the investigations you are familiar with, the

expert has rested his conclusion upon those things in his judgment, and not in the fixing of percentages?

150 A. Yes, I think that is, in the main true, largely for the reason that exact information is difficult of ascertainment, if not impossible to secure.

Q. Have you ever made any investigation of the life of rails upon a road devoted exclusively to freight business, or almost exclusively to freight business, as against one having a large passenger traffic?

A. I have given a good deal of attention, the last few years, to the subject of the life of rail. I have gone far enough into the subject to know that there is very iittle data available to the engineer in general practice, as I have been, and that there is a vast difference in the life of rail on different roads, as between straight track and curved track, as between the inside and outside rail on the curve, and as between rail on level track and on grade. There has been an immense amount of investigation reported to the different railroads that, if it were analyzed, if it had been analyzed by the different engineers familiar with each local condition, and tabulated, would unquestionably be of great value; but such anaiysis, in most cases, has not been made.

The Master: Any of it on roads used exclusively for freight?

A. In some work that I did a year ago, on the Buffalo, Rochester & Pittsburg Railroad, a road which was used exclusively for freight, and a road having a tremendous tonnage per mile of road, I got some figures that were fairly definite; but that case is not at all comparable with D. S. S. & A., for the reason that the Buffalo, Rochester & Pittsburg has a great many times—25 or 30 times the tonnage, per mile of road, that South Shore has.

Q. The rails have a very short life on that road?

A. The rails have relatively a short life on that road; I haven't enough data that would enable me to fix the life on rails based

151 upon the tonnage over them, but the use of the road by trains—the tonnage over the rail—is unquestionably a large factor in the life of rails; whether the rail is on the main line, with heavy or light traffic, on branch line or side track, would so affect the life of the rail, and wear of the rail, that it is very difficult indeed to fix any average figure that would be fair to apply.

Q. Then, weight and the number of wheels is just as important a consideration as speed?

A. Well, all of the conditions, weight, the number of wheels, speed, the number of curves, and whether the track is on level or on light or heavy grade, all enter into and affect the life of rail. For example, there is one curve on the Buffalo, Rochester & Pittsburg where the life of the rail is less than a year, while there is other track in the main line, nearby, where the life of the rail is 10 or 12 years.

RIGGS, recalled.

Further recross-examination.

By Mr. Wykes:

Riggs' apportionment of mileage of track in Michigan between freight, passenger and common, as corrected, is as follows:

152

Character of track assigned.	Exclusive passenger.	Exclusive freight.	Common.	Total.
Main Line:				
Owned	....	.....	420.18	420.18
Joint	....	.....	.83	.83
Branch Line:				
Owned	....	52.85	.....	52.85
Joint	....	2.02	.....	2.02
Second Track:				
Owned	....	.....	5.08	5.08
Joint	....	.....	.74	.74
Sidetrack:				
Owned	.77	87.49	30.79	119.05
Joint	.85	13.65	.71	15.21
Terminal:				
Joint	....	1.26	.26	1.52
Total	1.62	157.27	458.59	617.48
Joint tracks, operated over, but not assigned to D. S. S. & A.....				21.53
Total Michigan trackage operated over.....				639.01

I have used revenue train mile basis for apportionment of common property and tracks used by freight and passenger, as given in Complt.'s Ex. 49, Riggs. I do not think it possible to use any basis for this division which would not be open to argument, opposition or criticism. I believe the revenue train mileage basis represents most closely the use of property.

Revenue train mile basis is computed on main line movements, as no part of revenue train mileage is made on tracks definitely allocated to freight or passenger. The question of time required for a passenger and a freight train mile is an element, but not very strong. I believe the freight train mile is substantially equal to the passenger train mile. It would make no difference that
153 freight train mile uses property twice as long as passenger, assuming both to be operating on a clear track. A slow moving train interferes with more trains than a fast one, while more track must be kept clear for the latter.

The reason that I make train movement the unit is that it is an exclusive use of the track. I cannot see that time is the determining

criterion, because part of the time the track is not in use. The unit of use is the train mile. If you assigned 12 hours a day for freight service alone, one-half of the property would be assigned to each. In such a case, time would be of more influence than as the schedules actually exist.

If it were possible to ascertain the actual time the property was used by each class of service, time would enter into the division more, but other elements, such as increased cost, delays, etc., must be considered. These other elements are also questions of time, however. It is not necessary that you know the speed of different classes of trains in order to say that a passenger train mile is equal to a freight train mile.

In the division of expenses of maintenance, considering the unit of division to be the train mile, to say that a passenger train mile equals a freight train mile, we must know the relative speed and weight of trains, number of car wheels and cars, and weights of locomotives. All should be studied before you can answer that the revenue train mile basis is proper for a particular road. The same elements that make certain classes of wear in freight service are also present in passenger, but some elements present in passenger service are not present in freight service, and vice versa.

You are weighing different elements against different elements, to some extent, but not entirely, for the greater part of the
154 stresses upon the tracks are due to locomotives and the first pair of drivers. For this reason, locomotive mileage is a very fair one. The locomotive mileage, generally, is about the same as train mileage.

Switching miles should be the same equivalent to the distribution of these amounts as miles that are not switching miles. Part of the cost of maintenance is due to wear and part to decay. The reason all should be divided between the two departments on the basis of train movements is that all the roadway, if not actually engaged in transportation, is incidental to the track. For that reason, whatever is the best basis for dividing track expenses should be used for other maintenance of way expenses. Any basis correct for the major items should be applied to minor ones.

As long as a road is maintained, and necessary, renewals of ballast are made, to keep the road in the most efficient condition. It cannot be said that ballast depreciates, but, if it is allowed to become mixed with dirt and is not renewed, you might say that it has depreciated. The replacement is not a betterment, except where the amount under the ties is increased.

I valued the car shop at Marquette at $20,736 ($1 per square foot), which includes everything—piping, lighting plant, etc. It was finished a short time before my appraisal. I examined the additions and betterments account, but applied a flat price of $1 per square foot to it, as well as to the stone shop building at Marquette, the rail sawmill, building, etc. I used that price on a large shop building of brick and stone, and on many smaller buildings, though the reason was different.

That $1 unit was per square foot. In the 1900 appraisal, we used

a cubic foot unit. I used the square foot, because it is much easier to ascertain. The square foot basis is fair on the great bulk of railway buildings, as they are generally of uniform height
155 and construction. The total book cost of that shop was about $16,000, but book charges do not include salaries of engineers, transportation of materials and other items which it is impossible to charge to particular work. That is true of any shop structure, but not so true of a depot or other building not used by employees of the company of the class that use this shop.

I did not examine the accounts with reference to specific buildings, but made general inquiries. It would be fair to say that in many cases transportation of material is not charged. Even *in* such items were charged here, I should not change my estimate, unless the total cost of the building was analyzed. In some cases, the cost of buildings which are identically alike vary.

There are about 150 (157.27) miles of track on which there is no passenger operation, and on which there is no train mileage which enters into the revenue freight train mileage. By the application of the revenue train mileage basis of division of the expense of maintenance of this 150 (157.27) miles, we assign the expenses of its maintenance on a train movement that doesn't occur at all. To make the division correct, it would be necessary to allocate the expenses of maintenance of that 150 (157.27) miles. The proportion of expense would be small. My percentage of condition is as high on these spurs, sidings, etc., as on main tracks, but the standards are different. The sidings and spurs assigned to joint use are kept in better condition than those assigned to freight only, except those freight lines to mines over which locomotives run often.

There are about two miles of track assigned exclusively to passenger use, consisting of Marquette depot tracks, etc. There are
156 a few buildings devoted to passenger use only, but they have small relative value. The exclusive freight tracks are feeders for the business of the main line. There are no passenger tracks which compare with these freight tracks, other than the two miles mentioned, and even the latter are not really comparable.

RIGGS.

Redirect examination.

By Mr. Butler:

The mileage statement and apportionment given, I believe to be correct, although I may be mistaken on minor tracks.

When I used the term "surfacing," I referred to the original work that is done to put the track in shape for operation. Re-surfacing is never a capital charge. Section men generally do re-surfacing, by fixing the joints and tamping the tracks.

The amount of maintenance due to use or to weather varies with the character of the structure, drainage, topography, soil and climate. Weather stress is much less upon concrete, iron or steel than upon wooden structures. The more permanent the material, and the

higher the class of structure, the less the depreciation by weather. Renewal of rails is due almost entirely to use, though weather is a heavy item in breaking of rails. The character of track maintenance, ballast, continuous joints, and other equipment, is due in considerable extent to passenger service, and they would be of a lower grade on South Shore for freight service only.

The outer rail on curves on level tracks wears out much quicker than the inner rail, though, on sharp curves, the head of the inner rail grinds off. The life of a rail is also shorter on a grade than on the level. With the limited knowledge of the subject so far
157 obtained, it is impossible to state any fixed formula for estimating the relative wear under different conditions, but it is well known that the wear is greater on curves and grades. The super-elevation of outer rail on South Shore is in no case extreme, the maximum being about three inches, while the degree of curvature is three or four and sometimes five. Such track is suitable for a speed of 45 to 50 miles an hour.

Freight trains do not usually go that fast around curves, and the tendency is therefore to wear off the head of the inner rail. It is practically impossible to adjust super-elevation to suit all traffic, but such elevation is necessary for safety from overturning at the curve at high speed. There is a tendency for the flange to climb the rail, and for the train to topple over. Rails do not break from the strain as often as do flanges, on account of the outer rail not being elevated enough. If heavily loaded cars go around a three degree curve which has a five inch super-elevation, at only 10 miles an hour, the flanges grind the inner rail, which has a tendency to tip over.

The revenue train mile, both freight and passenger, was performed wholly upon the tracks which were assigned to both freight and passenger business. The engine mileage performed on the exclusive freight tracks is called a switching mileage. As a rule, a train occupies, to the exclusion of all others, the space between two nearest stations. Passenger trains generally have precedence, and freights must often sidetrack while a passenger train goes by two or three stations.

Tractive power of locomotives depends on weight, size of cylinders, and size of drivers. Other things being equal, tractive power increases with the size of cylinders, stroke, boilers and drivers.
158 If one passenger train and one freight train each way, every day, go over a stretch of track protected by cattle fence, the expense of the fence would, on the revenue train mile basis, be equally divided between passenger and freight. If the freight train earned nothing and the passenger train earned $10, and the expense were divided on the revenue basis, passenger would have to pay the entire cost of the fence, though freight would have equal protection.

On November 16, 1912.

RIGGS, recalled.

Further direct examination.

By Mr. Butler:

In fixing unit price on country lands, I have not attempted to fix values on individual pieces, but average prices which are in my opinion fair and conservative, taking into account:

(*a*) The fact that the consideration paid for a narrow strip of land always exceeds, by from 2.5 to 6 times, the acre price of ordinary sales in tracts of such size as are sold in usual business.

(*b*) That cost covers the value of the land taken and severance damages to the remainder of the tract.

(*c*) That the land is available and demanded for railroad use.

(*d*) That the cost to railroad company, in addition to consideration paid owner, covers abstracts, expenses and salary of right of way agent, entry fees, recording deeds and contracts, expense of attorneys, courts and juries in condemnation.

159 RIGGS.

Redirect examination.

By Mr. Butler:

Assuming maintenance of railroad, its roadbed appreciates greatly by lapse of time, and that was taken into account by me in saying that cost of reproduction new was to be the value.

On February 25, 1913.

RIGGS, recalled.

Cross-examination.

By Mr. Wykes:

I may have said in testimony that the cost of maintenance of ore spurs and branches would be, per mile, substantially as much as main line and main line branches, by reason of the rougher usage to which the tracks were put and the heavier movement over them. I don't believe it possible to make any definite separation of the cost of maintenance of these tracks from any company records.

On sidetrack and spur construction, I took into account maintenance condition in fixing my percentage of present condition. On them, I used a lower percentage than on main line. The Bessemer and Republic branches and south line, Eagle Mills to Winthrop Jct., were treated as main line. As to proportion of cost of maintaining

main line, what it would cost to maintain industrial tracks would depend on the service and the number of movements.

I think, in general, it is fair to say that on any secondary track the maintenance per mile is less than main line track. The practice of many railroads is to consider 2 or 2.5 miles of secondary track or siding equivalent to a mile of main line, in arrivng at an average figure per mile on maintenance, and some of these tracks will unquestionably have very little money spent upon them annually
160 for maintenance, while others will have a very considerable amount. I would expect to find much more money spent per mile upon such a line as Palmer branch than on Deranson lumber spur, or other lumber spurs on west end.

On such lines as Palmer branch, there are a large number of movements, and they are in the sense of mine movements over them. There is considerable operation on those tracks, and there might be more frequent movement and more tonnage over them than on some parts of the main line; e. g., parts of the line west of Nestoria; I don't think that would apply to the whole line. Other parts of the line having nothing over them but regular trains, while the mine spurs have a large movement of ore from the mines to the main line.

In Complt.'s Ex. 49, Riggs, I allocated south line, Eagle Mills to Winthrop Jct., as common main line. There is on a portion of that track (south line, Eagle Mills to Negaunee) a very considerable part of main line freight train movements. It is operated, really, as a part of second track; for that reason, I classified it as main line. The passenger station at Ishpeming is on north line, a mile or more away from south line, so that all of the passenger train main line movements are, I think, over the north line.

I have treated the south line, Negaunee to Winthrop Jct., as main line, common between passenger and freight. I think the same is true from Eagle Mills to Negaunee. I think it might be proper to exclude from common track such portion as is not used in regular main line movement; I think it would be proper on that portion of it that is treated as main line and used by main line freight trains, thereby relieving the north line and saving the necessity of second track, the same as the rest, even though there were no passenger movements over it; that is because it relieves the other track.

161 These eight miles of line would necessarily be assigned to the freight business if you strictly exclude everything that is not operated on by passenger trains. My theory of treating it as common is that it is, in effect, a double track and relieves the main line, leaving it free to passenger traffic to a greater extent than if these freight trains ran over it.

The north line is single track from Marquette to Eagle Mills and double track from Eagle Mills to Negaunee. There are three lines of rails from Eagle Mills to Negaunee. All passenger movements, both east and west bound, are over the north track, and pass the passenger station at Ishpeming.

The 8.7 miles, Humboldt to Republic, I treated as common main line; also the 2.23 miles, Bessemer Jct. to Bessemer. If there is no passenger traffic on that, it would, under a strict allocation, come out.

Between Winthrop Jct. and Marquette is practically the only double track line on South Shore; in part, there are three tracks there. This is made necessary by the large amount of train movements due to the ore business and operation of C. & N. W. and C. M. & St. P. trains over the track; all those conditions unite to make that a very congested district.

RIGGS.

Redirect examination.

By Mr. Butler:

With minor exceptions, the main line tracks are used for both freight and passenger trains. Refinements in construction and adjustment made necessary for faster moving passenger trains increase the maintenance charge over what it would be if the tracks were used by freight trains alone; that extra sum is undoubtedly substantial. The spurs and sidings not used for passenger trains
162 are not subject to refinement necessary to keep the tracks in safe condition for passenger trains, nor are they subject to the extra cost made necessary thereby. Other things being equal, except the use, the maintenance of such spurs and sidings would necessarily be less.

The sidetracks were estimated on the basis of relaying rail. That is not true of tracks not included in Schedule 16, Sidetracks. It was assumed that relaying rail could be used indefinitely in these tracks, and would not need renewal; theoretically and practically, there is, therefore, no rail renewal. Ties are not so numerous, being 3,000 to the mile on main line and 2,640 on sidetracks. The ties in spurs to lumber yards and sidings would not require as frequent renewal as in main line, and they are cheaper—culls; they could be used until they practically rotted away. On these spurs and sidings, there is no ballast, except sand or earth surfacing; so the item of ballast maintenance would be eliminated. What is true of rails, ties and ballast would be true of the item "other track material."

There are practically no bridges, trestles or culverts, and only a small amount of minor drainage, on these spurs, branches or sidetracks; so the expense of their maintenance would be practically eliminated. By far, the greater portion of maintenance of bridges, trestles and culverts would be exclusively on main line. On these branches, sidings and spurs, there are some grade crossings, but no fences or cattle guards. What grade crossings there are would not be kept in as good condition as on main line, except in some of the cities—Ishpeming and Negaunee.

There are no snow fences to any extent, and no signal or interlocking plants, or telegraph or telephone lines, and no buildings. The expenditures for roadway tools and supplies would be in about the same relation as work and material put on the spurs, branches and sidings.

163 The principal items in maintenance of main line are ties, rails, ballast, bridges, trestles and culverts, buildings, fixtures

and grounds, other track material, and repairs to roadway and track. The expenditure on the branch lines, sidings and spurs, for roadway and track, would be much less per unit of distance than on the main line.

Usually, in computing mileage for a determination of maintenance cost per mile, 2 or 2.5 miles of branch and secondary line or sidetrack is considered as one mile of main line. That would be all sidetrack mileage of the road; it would be a much greater proportion for a spur to a lumber yard, because the amount of money spent on a mile of main line passing track would be much more than spent on one of these lumber *of* spurs. The maintenance of a main line passing track would probably be, per unit of distance, six times more than the maintenance of a spur going out to an industry. I think it would be impossible to get exact figures for the cost of maintenance of exclusive freight tracks, unless that information were specially desired and separated.

RIGGS.

Recross-examination.

By Mr. Wykes:

Of under and overhead crossings, there are two or three at Marquette; they are for carrying over the freight tracks.

When I said it might cost six times more to maintain a passing track than a sidetrack to an industry, I did not mean to include in the sidings the important mine spurs, as I should classify some of them as fairly important tracks, with frequent movement and more maintenance. Some of South Shore spurs have such traffic over them that there must be considerable maintenance in order to keep them safe.

164 I cannot say that South Shore is ballasted beyond the point of good practice, or even up to good practice, but there is more ballast on the road than if nothing but freight movements were made over it. The ballast has the tendency to lengthen the life of the ties. I do not think that the expenditure of $2,507 for ballasting on South Shore in Michigan in 1910 was more than would have been put there had the road been engaged only in freight service.

On November 28, 1913.

RIGGS, recalled.

Further direct examination.

By Mr. Butler:

Complt.'s Ex. 1*a*, Riggs, is Riggs' second appraisal of D. S. S. & A. It is a revision of Complt.'s Ex. 1, Riggs, and excludes property not in existence June 30, 1913, and includes additions and betterments to June 30, 1913. The property is allocated to exclusive passenger,

exclusive ore, exclusive freight (other than ore), common freight and passenger, and common ore. The summary includes ore and freight under caption "Freights." The arrangement, in general, is the same as Complt.'s Ex. 1, Riggs.

Complt.'s Ex. 1*a* covers the entire ground of Ex. 1; where the structures remain unchanged, totals only are carried into Ex. 1*a*. Where a structure remains unchanged, Complt.'s Ex. 1 must be referred to for the details. Complt.'s Ex. 1*a* relates only to Michigan property. No lands or overhead charges on lands are included in Ex. 1*a*. The figures in the summary, sheet 1, are based on Ex. 1, modified by examination of the property made this year, and relate to June 30, 1913.

165 While, in one or two schedules, there have been some changes of unit prices, in the great majority of schedules they remain the same. Corrections have been made in some of the schedules. The inventory is based upon two inspections made this summer (1913), partly by me and partly under my direction, whereas, for some of the schedules in Ex. 1, I depend on company records. In this case, we have made an inspection and inventory in the field. The purpose, among others, was to get the deductions and additions between June 30, 1911, and June 30, 1913, and to note errors of omissions or inclusions of first appraisal.

The schedule of culverts and minor waterways in Complt.'s Ex. 1 was based on office notes of the superintendent of bridges, without detailed inspection. Mr. Hansel used my figures for culverts.

Our inspection was made to bring schedules to date, and to give an inventory of minor waterways. Messrs. Baily and Cadarette, who assisted in the inspection, reported to me the result of the field work; I was in constant touch with them while on the inspection. All matters coming up during checking of schedules were referred to Mr. Cadarette, and quite a large number of structures other than bridges were measured and checked by him.

The totals on summary sheet, page 1, cost of reproduction, $17,584,369, and present physical value, $14,602,343, include no real estate or overhead charges thereon. In my opinion, the summary statement is a fair statement of what it purports to be; also the allocation between the different classes of business.

In Complt.'s Ex. 1*a* are corrected certain errors of Complt.'s Ex. 1; e. g., water and fuel stations at Soo were included in en-
166 tirety, while there should have been included only one-half interest; three or four structures which existed in 1911 were omitted. The total amount involved is not large; these additions and deductions are not specifically described as being corrections to Ex. 1.

To ascertain the value of the property as of June 30, 1913, there is no occasion to refer to Ex. 1, except for details.

Page 2 of Complt.'s Ex. 1*a* is a summary comparing Complt.'s Ex. 1, Defts.' Ex. 15, Hansel, and Complt.'s Ex. 1*a*. In comparing, I did not correct percentage items of Hansel or 1911 appraisal, by excluding percentages on land. On sheet 2, the 1911 appraisal is as corrected by Complt.'s Ex. 50, Riggs.

Pages 3, 4 and 5 of Complt.'s Ex. 1*a*, Riggs, relate to mileage. The differences between the mileage as of June 30, 1911, and June 30, 1913, is analyzed, showing:

Soo to Marquette, increase, branch lines	7.43	miles
St. Ignace to Soo Jct., decrease, branch lines	.05	miles
Marquette to Houghton, decrease, branch lines	.42	miles
Marquette to Houghton, decrease, branch lines (joint)	.22	miles
Nestoria to state line, increase, branch line	8.67	miles
Net	15.41	miles

This increase has been built since the 1911 inventory.

Pages 6 to 9 of Complt.'s Ex. 1*a* shows grading, clearing and grubbing; this is divided to freight, passenger, common freight and passenger, and iron ore; the iron ore and freight are separate, but have been added to carry into the summary on page 1.

Throughout the schedules in Complt.'s Ex. 1*a*, the word "freight" excludes ore; the term "ore" includes that handled in ore trains to Marquette from the mines, and takes no account of property
157 used for ore carried in freight trains to other points than Marquette docks. "Exclusive Freight" includes ore moved over other parts of the line than from mines to Marquette. The ore property, as I have segregated it, as exclusively used for the ore business, all lies at Marquette or between Marquette and Beaufort Jct., on the main line.

I have made comparison of schedule 3, Grading, Clearing and Grubbing, between Complt.'s Exhibits 1 and 1*a* and Defts.' Ex. 15, Hansel. For this schedule, I used the same unit prices and quantities in 1911 and 1913, with increase in 1913 due to addition of 15.41 miles of branch line. The increases are:

Grading, 15.41 miles new branch line	123,280	yards
Grading, filling trestles	131,500	yards
Clearing and Grubbing, 15.41 miles branches	92	acres
Increase, C. O. R., due to above	$83,794	
Increase, C. O. R. net ($3,500 deducted due to elimination of retaining walls)	$80,259	

The difference between Complt.'s Ex. 1 and Defts.' Ex. 15 is accounted for almost entirely by difference in unit price for earth.

The comparison of unit prices and quantities is as follows:

168 Earthwork.

Unit Prices.

Description.	Riggs, 1911.	Riggs, 1913.	Hansel, 1912.
Earth	$ .30	$ .30	$ .20 .26 .40
Loose rock	.50	.50	.50
Solid rock	1.35	1.35	1.35
Shrinkage	.30	.30	.25
Clearing	40.00	40.00	40.00
Grubbing	100.00	100.00	100.00
Masonry	10.50	10.50	8.00‡
Dry Stone	9.00	9.00	8.00‡
Excavation and backfill	.30	.30	.50
Excavation in cut	.30	.30	.26
Timber, per M	36.64	36.64	38.00
Piles, per foot	.40	.40	.40

Hansel Valuation	$2,442,311	$2,419,763
Riggs 1911 Valuation	2,879,484	2,855,596
Riggs 1913 Valuation	2,959,743	2,935,985
Riggs 1913 increase over 1911	$80,259	$80,389

Increase accounted for:

Grading on 15.41 miles new line, 123,280 yds. at 30c	$36,984
Clearing and Grubbing, 92 acres	7,360
Filling Trestles, 131,500 cu. yds. at 30c	39,450
	$83,794

Some retaining walls renewed; one cut out. Some minor grading at small culverts, to adjust amounts. No addition made on account of widening cuts and fills.

‡For concrete.

169 *Comparison of Grading Yardage as Computed by Riggs in Complt.'s Ex.* 1 *and Hansel in Defts.' Ex.* 15.

District.	Earth.	Loose rock.	Solid rock.	Shrinkage.	Overhaul, crossings, etc.
Riggs' estimate of cubic yards:

Hansel's total yards					7,557,900
Difference					109,266
Riggs in excess of Hansel					0.01–446/1000%

Applying Riggs' price to Hansel's yardage:				Complt.'s Ex. 1.
Earth,	6,629,100 square yards at $ .30	$1,988,730		$1,911,949
Loose rock,	174,000 square yards at .50	87,000		91,942
Solid rock,	95,800 square yards at 1.35	129,330		93,590
Shrinkage,	472,700 square yards at .30	141,810		178,418
Overhaul,	186,300 square yards at .30	55,890		133,813
		$2,402,760		$2,409,712

170 In assignments of property to different classes of the service, we have assigned to common, grading, etc., and other structures on main line, passing tracks, and other tracks jointly used by freight and passenger trains or by freight trains in getting out of the way of passenger trains. We have assigned to freight, grading, etc., in all of the yards; also on all branch lines except Republic branch, which is figured as main line, used for both. To ore is assigned all branches to mines between Marquette and Beaufort Jct.

The basis is the use, and roadbed used for freight is assigned to

freight, for passenger to passenger, and for ore to ore, including the fixed structures of the roadway.

Page 9 of Complt.'s Ex. 1*a*, Riggs, contains a recapitulation showing amounts allocated to different services for grading, clearing and grubbing. (Witness re-states amounts from that page, and states they are fair present C. O. R. and P. P. V.)

The following statement shows the average unit prices used by me in each of my appraisals and the unit prices used by Mr. Hansel as to the schedule of ties:

Unit Prices.

Riggs average, 1911 Valuation	$.3477½
Hansel "	.40
Riggs " 1913 Valuation	.40

170*a* *Average Prices of Ties of Each Kind—5-year Period.*

	Cedar.	Hemlock.	Tamarack.
1909	46.41¢	38.47¢	33.31¢
1910	41.91	30.14	30.47
1911	33.27	28.81	27.49
1912	34.13	30.57	29.84
1913	37.95	33.33	32.02
Average, 5 Years	38.73¢	33.77¢	31.04¢
Handling	5.5	5.5	5.5
	44.23¢	39.27¢	36.54¢

I have increased the price of the ties from 3477½ cents to 40 cents, my reason being that the price of ties at the present time and the average prices of ties for the period of the last five years all justify this increase. I am assuming the same kind of ties, and am using in this case a figure that happens to be the same as used by Hansel in 1912, which makes an increase, in round figures, of 5¼ cents per tie. The average price referred to by me was arrived at by taking the total number of cedar ties purchased by the D. S. S. & A. each year, and the total amount of money paid for them, to arrive at the average for the year of the cedar ties, and the same as to hemlock and tamarack, and using these three averages to produce the final average.

Pages 50 to 52 of Complt.'s Ex. 1*a* contain schedule 10, Ballast. There is an increase, in 1913 over 1911, of $10,850, in cost of reproduction. The difference between 1911 and 1913 accounted for 600 yards per mile of sand ballast at 30¢ on 15.41 miles additional line. I have made no increase in value of ballast due to extensive re-ballasting west of Marquette. There, a large mileage of main line has had additional ballast put on, and it has been brought to a very much better condition; there has been quite a large addition, by reason of

widening cuts and fills, but no increase has been made except on account of the additional lines.

I have estimated ballast at a maximum of nine inches under the ties, and, if there happened to be 48 inches under the ties, it
171 has not been considered as ballast. There, clearly, is an increase in value, or in the condition of the track. The track west of Marquette was fully ballasted prior to 1911, and the work done since puts on an excess amount of ballast—more than I have computed as the maximum for the standard of construction that I have used. I don't know that I should regard what has been put on as maintenance. I don't add for that excess ballast.

We have allocated to common passenger and freight, all stations where the station building serves the purposes of both. Where there was a freight room and a passenger waiting room, ticket office and telegraph office, that building has been assigned to freight and passenger, together with the platform. At some smaller stations, such as Champion, where there is a building used exclusively for passenger service, we have assigned them to passenger, notwithstanding the fact that the Marquette building, and, to some extent, all of them, are common, in that they have a telegraph office. We have not made separation by reason of the telegraph office, nor at Marquette station on account of the offices. Some of the buildings assigned to exclusive freight also have telegraph offices used for both departments and for the public.

In buildings having a freight room, a passenger room, a ticket and a telegraph office, I have not attempted to apportion between freight and passenger. We started to study the possibility of apportioning those buildings on the basis of the number of square feet of floor space. Those figures were not turned over to me. At Marquette, there is an exclusive freight depot and a passenger station. On the second floor of the Marquette passenger station are the offices of the superintendent, car accountant and others, in which business is conducted for both departments.

172 It is difficult to make an assignment of that building; it would be manifestly improper to make an allocation on the basis of square feet of use, as the building is primarily, essentially and mainly used for passenger business, and the company could not transact its passenger business at Marquette without the whole area that is devoted to this service, while it could transact its other business elsewhere. It is a two-story building, and, while it may be proper to assign some portion of its value to the common use, I hardly know how to go at it to make such assignment. I have not the data to show the pertinent facts. Nor have I for the buildings along the line generally used for all purposes of the company.

Page 130 of Complt.'s Ex. 1*a*, Riggs, schedule 35, **Engineering on** Equipment; 2% of cost of reproduction allowed, as in 1911, and allocated with equipment assigned to different classes of the service. **Hansel allowed same rate, and carried it without depreciation, as I did. Hansel allowance, $61,042; Riggs 1913, $71,773; Riggs 1911, $58,924.**

Pages 133-136 of Complt.'s Ex. 1*a*, Riggs, schedule 37, Contingen-

cies; allowed, cost of reproduction, $1,132,048, and present physical value, $933,917. The contingency is computed as a percentage for each schedule, and the present value is computed by the same percentage on the depreciated item. No contingencies on land are included in Complt.'s Ex. 1*a*. On page 2, contingencies on land still appear in the 1911 column, but not in the 1913 column. Hansel allowed $479,735, for both cost of reproduction and present physical value.

Complt.'s Ex. 1*a*, Riggs, schedule 38, Legal Expenses. This is .5% of all items except land (1 to 37 inclusive), and is not depreciated. Allowance, 1913 (without land), $77,637; 1911 (with land), $85,122. No contingency allowed by me on this item.
173 Hansel allowed $70,000, with 10% contingency. This is allocated the same as the property upon which it was computed.

Complt.'s Ex. 1*a*, Riggs, schedule 39, Organization, Administration and General Expenses. 2% on items 1 to 37 inclusive. Allowed, 1913 (excluding land), $310,551; 1911 (including land), $340,490; Hansel allowance, $100,000, plus 10% contingency.

Complt.'s Ex. 1*a*, Riggs, schedule 40, Interest during Construction. 7½% of items 1 to 39 inclusive; it is not computed on land in 1913. The 1913 amount is $1,193,679, without depreciation. Items 38, 39 and 40 are allocated to the different classes of business by application of the percentages to the base figures which were allocated.

Complt.'s Ex. 1*a*, Riggs, schedule 42, Stores and Supplies. Value, 1913, $308,502, based upon inventory. The assignment is made to each item on the inventory to freight, passenger or common. There is no attempt to allocate to ore. The Michigan proportion is 81.87% of the total, based upon main line mileage.

Complt.'s Ex. 1*a*, Riggs, schedule 43, Working Capital. In 1913, $154,000; Hansel, 1912, $100,000; Riggs, 1911, $198,000. The figure for working capital in 1911 (also 1913) was given me by Mr. Delf, and derived by him from the books. I understand it is the average monthly cash on hand, plus cash in transit from the agents and accounts collectable, being the average of twelve months.

From page 1 of Complt.'s Ex. 1*a*, in my opinion, the fair and reasonable present reproduction value of the South Shore property in Michigan, excluding land, was $17,584,369, and the fair present physical value, $14,602,343. I believe Complt.'s. Ex. 1*a* is fair,
174 reasonable and conservative, in respect to every item. I have endeavored, in making it, to correct error where I have found it, up or down, as the case might be, and to make a more correct, up-to-date inventory of the various individual parcels than has been done before.

In the present physical value column, I have endeavored to put the cost of reproduction for each separate item affected by the depreciation of that item. It represents the present conditions of the various elements of property, as compared with new units. As a whole, it is not to be understood as meaning any impairment in the use value of the property.

Perhaps, in some instances of property, it might, but, as a whole,

the usefulness of the property, and its capacity to perform service, is just as good at 85% condition as it would be if all the elements were new. The property is more useful as an instrument to carry on the business of the company than if new, because the various parts are co-ordinated, working together, have been tested out, and it is a seasoned operating property, and, therefore, better than a new, untried, unbroken property. The property included in schedule 3, Grading, is in better condition as an old property than it would be if new.

I have endeavored to allocate to freight, passenger or ore, all property that could be so allocated by reason of its exclusive use in that particular branch of service. Property commonly used by freight and passenger was figured as property common between the two. That would be so as to an item of property that was used relatively a small amount in one department or in the other; it was simply included as common between the two. No attempt was made by this exhibit to make any apportionment of the common property to either class. The items allocated to freight are all in use in freight service; the same is true as to passenger and ore.

175 Under engineering on roadway and structures, I have included 4% of all roadway and structures schedules. In that, I intended to cover engineering in reconnaissance and preliminary and location survey—the construction survey—that is, the engineering work necessary to take out, measure and inspect the roadbed, embankments, cuts, fills, etc.; also the engineering, inspection, plans, etc., of bridges, trestles, buildings of all classes, docks and wharves, and other permanent structures along the line in Michigan. I believe 4% is conservative, if not too low, to cover the actual expense, if the real estate is not included, on account of the large amount of work necessary in creating the railroad. I have in practice and study become familiar with the history of the extent of preliminary engineering work before the actual laying out of the work and going on to construction.

The reproduction estimate assumes the territory to be as it now is, and engineering work on such a property as D. S. S. & A. today is probably more favorable to low cost of engineering than in the early days when the road was built. I think if it were possible to determine original cost of engineering on D. S. S. & A., as it exists today, that would be more than I had estimated.

As I conceive the problem of original cost, it is to secure the original cost of all structures originally or subsequently built on the line, deducting all that have been abandoned or ceased to exist. I have never undertaken to estimate original cost, and do not have in mind the most correct method of arriving at it.

I think original cost of engineering on D. S. S. & A. would be greater by reason of the more difficult condition existing in the early days, adding to the expense of reconnaissance, preliminary and location survey and construction survey, and also due to the fact that the road was built piecemeal, and was spread over a great

176 deal more time, and that many of the pieces of property as they exist now were put in as small items of property on

which the engineering percentage would be unduly high—much higher than if it were possible to reproduce the property as a whole.

Notwithstanding the line is already fixed, assuming its elimination, it would be necessary to re-locate it, and to incur anew all of the expenses as if we were building another, new railroad in the territory, with the same mileage. My belief is that the final intention in 1900 was to include all engineering charges proper and necessary as part of the cost of construction of a railroad. I only know in a general way what part of the 4% engineering charge would belong to engineering for reconnaissance.

On a line I had charge of in Indiana, the reconnaissance and preliminary and location surveys, in rather open country, cost around $100 a mile, while the total cost was $850 a mile. The preliminary surveys would be much greater in a heavily timbered country than in open country.

Complt.'s Ex. 1*b*, Riggs, is an inventory describing right of way and station grounds of D. S. S. & A. in Michigan as of June 30, 1913, and allocating portions thereof to the different services. The right of way and station grounds are in order by counties, following as nearly as practicable the list in Ex. 1. The acreages of right of way have been carefully compared and checked by Mr. Cadarette and myself. Maps of certain cities (named) have been prepared to correspond with the allocation. The description numbers of Complt.'s Ex. 1*a*, Riggs, identify the descriptions on the maps.

Complt.'s Ex. 3*a*, Riggs, includes descriptions 1 to 14 inclusive, Chippewa County, of Complt.'s Ex. 1*b*, Riggs.

177 Allocations on Complt.'s Exhibits 1*b*, Riggs, and 4*a*, Riggs, are, in my opinion, correct.

I have studied conditions at Houghton, walked over the territory, Houghton to Pilgrim River, crossed by South Shore, about 2.5 miles from end of Houghton yard, secured all topographical maps made by the Government in that territory, secured copies of those locally made, and made notes on the condition. Between Chassell and Pilgrim River, there would be no serious difficulty in constructing a railroad between the foot of the hills and the South Shore, and such railroad would not be of appreciably greater expense than South Shore.

From Pilgrim River to Houghton, South Shore right of way occupies a very narrow shelf of land at the foot of the bluffs; the railroad level varies from 15 to 30 feet above water, and on the bench they occupy the original profile shows a very light grading—fills and cuts of two or three feet, with the exception of one or two streams crossed. The average grading per mile was about 7,000 yards. The right of way varies in width, averaging, perhaps, 75 or 80 feet—some 66, and some 100. The foot of the bluff is very close to the right of way fence—within a few feet, all the way; in a few places, the slope is so steep that the right of way fence is 15 or 20 feet above the track. From Isle Royal stamp mill, near Pilgrim River, to end of terminal yard, the bluff is abrupt, and rises to a height of 96 or 97 feet above the lake at the school of mines.

From the center of South Shore track opposite the school of

mines building, where the track is, perhaps, 20 feet above the water, over to a point where the bluff is 100 feet high, the distance does not exceed 150 to 200 feet.

178 Back of the summit, spoken of as being 100 feet high, is a second bench, which varies in height from 40 to 100 feet above the lake, being 200 or 300 feet wide; the hills back of that rise rapidly to the height of over 400 feet, and this range of hills extends for a number of miles. It would be absolutely impossible for a railroad, approaching from the south, to secure an entrance into Houghton that is favorable as to grade and amount of work as that of the D. S. S. & A. To go back of the city and come in on the line of the Copper Range would involve crossing a range of hills over 400 feet high and the construction of many miles of additional line, to secure a feasible grade.

Mr. Wykes: I wish to make an objection to the narrative as given, and to any statement of cost of locating a line on any other route, or of any other road purchasing a line through this route to parallel the South Shore, as being immaterial.

All the terminal land of the plaintiff occupied by tracks shown on Complt.'s Ex. 16*a*, Riggs, is on a level, approximately 20 feet above the water. There is no other piece of land east or south of the bridge across Portage Lake large enough or available or suitable for yards, except that occupied by plaintiff. I have made an approximate estimate of the cost of constructing a line from Pilgrim River into Houghton, 2.5 miles, and a further distance of 1.5 miles, to a point near Copper Range, which is the nearest suitable physical location for a yard, disregarding all questions of present occupation, ownership, values or cost of land, the line assumed being partly on land owned by plaintiff, as being the most favorable line.

It is my opinion that, ignoring all those things, without allowance for land, simply the difference in construction cost, it would

179 be impossible to build such a line and provide equal yard facilities for less than $250,000 in excess of the cost of creating the South Shore property, or a similar property. It is my further opinion that such a line, because running through the business center of Houghton and cutting into high class residence property and that owned by the State, would be absolutely impossible to build. If it were necessary to actually build such a property and acquire the land for it, the cost would run into millions.

The excess cost for the 2.5 miles and the 1.5 miles additional line for the yard would be $250,000. The only point topographically suitable for a yard is about a mile west of the bridge, near the Copper Range yards. The excess cost is due to cost of grading, extra construction, and extra length of track, and it is based on the assumption that there would be no land to pay for. The excess arises from the fact that line must be higher than South Shore, that the earthwork would run 75,000 or 80,000 yards per mile, while South Shore runs approximately 8,000 yards, the culverts would be longer, heavier and more expensive, and there would be more rock and loose rock. I disregarded all questions of land value or cost of acquisition

of right of way, and simply make comparison of physical construction.

I have made the same study with reference to the approach to Marquette from the east. There, referring to Ex. 6*a*, from a point near the Standard Oil Co. dock to Chocolay River, about two miles, the road occupies a flat bench varying from 125 up to 260 feet; at one point, where the Carp River comes in, the valley widens out so there is a gap or distance between the hills of a quarter of a mile On this narrow bench, an average of 20 feet above the water, and almost level, the D. S. S. & A. occupies the land nearest and clo e to the water's edge; the M. M. & S. E., for the entire distance, lies alongside the D. S. S. & A. and within a few feet of it, except
180 at the Carp furnace, where D. S. S. & A. is on the lake side and the other road is on the land side of the furnace, for a quarter of a mile, the roads being at least 100 feet apart.

From Marquette yard to Carp River, about a mile, there is on the hill side of the road a tier of rocks, which are quite shallow, 60 to 80 feet in depth. On these, are 14 or 15 houses, and some other structures, so the entire plat from Marquette to Chocolay River is occupied. From Carp River to Chocolay, where the hills are close, are two points where the hill comes up to the road with quite high bluffs of solid rock, and, except for these two points of rock and one or two dwellings, there is practically no occupation of the ground between the highway and the hills. The hills are very irregular along the lake front. There is no second bench; it would be absolutely impossible to locate either a hillside line or a line on any second bench, and either the flat must be occupied or a hill line located to come into Marquette at a point a couple of miles away from the present lower yard, at a much higher elevation.

I have looked at this thing in three ways: First, assuming it possible to use the highway, without providing any other location for a highway, there would be practically no added expense over the construction of the South Shore; second, if it were necessary to move and furnish a new highway, eliminating all questions of land value, it would be necessary to make two quite heavy rock cuts, one at each point of rock, and the expense would be $25,000; third, the cost of construction of a line in the hills would be over $300,000 in excess of the line on the flats, and would contemplate providing a yard remote from the water front, and back of the city; the cost of this yard is included in the amount given. I am speaking simply of construction costs, not taking into account land values, cost of
181 right of way, or buildings; it is almost impossible to fix the excess cost of securing a suitable yard, meaning cost of construction. The lower yards are on available land, and have not involved expensive construction.

The first two plans bring me to the lower yard; from that point to another suitable location for a yard would involve about 1.5 miles of additional land, and some heavy rock cutting, requiring an excess cost for construction over existing cost of $40,000 to $50,000, and ignoring land values. That would give a yard on a branch, without access to navigable water, and add tremendously to the cost of opera-

tion of the yard; I have no means of computing the added cost of operation; it would be substantial. By navigable water, I mean navigable harbor.

RIGGS.

Recross-examination.

By Mr. Wykes:

In estimating the excess cost of $250,000 out of Houghton, I prepared countour maps which enabled me to plat several profiles, and the facts given were based on the study of these, determining the feasibility of different lines and the approximate yardage of earth that would necessarily be moved in their construction. I made no measurement on the ground, further than to, every few hundred feet, make notes as to the condition of the hill, the distance of the foot of the slope from the center of the tract, and the approximate rate of slope of the hillside, to enable me to say from my knowledge that the maps were correct.

I ran no line, and made no surveys or locations, either at Houghton or at Marquette. I made a careful reconnaissance of the ground, and based my estimates from notes taken by me, and from
182 Government and other maps which I had with me of the ground, so that, to my own satisfaction, I verified the conditions disclosed by the contour of lands upon the maps. From my study of the topographical maps, and from going over the line of plaintiff and inspecting the cliff, and its height and location, I have formed a judgment that the excess cost of construction would be as I have stated. In my judgment, the cheapest possible line into Houghton would have to be located on the hill side of the D. S. S. & A., as near as possible to the existing line. In making my assumption, I have located it as nearly as possible to the South Shore without interfering with any existing structures or railroad use of the land now occupied by South Shore.

That location would force the line to a level, 30 to 40 feet higher than the present South Shore tracks. My estimate is based on the difference of cost of physical construction between South Shore road and another line as nearly as possible to that location, but so located as not to interfere with any railroad use of the South Shore land.

I made quite an elaborate study of both situations; I spent a couple of days *of* the ground at Marquette, and a day on the ground at Houghton, and two or three days in the office, besides having cross-sections made by assistants, and made quite numerous figures upon which I base my answer. Those figures are not what I have given, but I have used them to predicate my judgment upon; I have not all those figures with me, but have certain maps, profiles and cross-sections with me.

I have made numerous estimates, but have not made up any complete estimate showing the details for the figures given for Marquette or Houghton, but I have in mind quite clearly the approximate earth quantities and the differences in elevation, and upon

those I predicated my answer and judgment. I can give
183 some of those figures. I have simply the result of a whole lot of study, and I don't know that I have them all with me. They are based upon the most available and cheapest line that it would be possible to get in, without interference with the existing property of the South Shore.

That line I located as approximately 75 to 100 feet away from the South Shore line, and substantially parallel to it except at the yard. From Pilgrim River to the terminal property, the yardage figures from the lowest line I located was 118,684 yards of pay earth, as against 21,056 yards on the existing line. There is no surface condition upon which to predicate a classification of the material; I did not attempt any.

That line is about half the total length of the line from Pilgrim River to the point where the new yard would have to be located, and takes us to the easterly end of the terminal. I figured that to get a suitable height for a yard it would be necessary to go 1.5 miles beyond that. I estimated, roughly, that it would require 300,000 additional yards of grading to get a satisfactory suitable line to a proper place for a terminal yard, part being due to the extension of the line 1.5 miles beyond the present terminal; that part being close to a half.

I haven't that line delineated on any map so it could be used as an exhibit; I could prepare it without much difficulty. To check it, it would be necessary for any one else to go on to the ground and make his own study, as I have done. He must, to estimate the same thing as I have, know where I placed my line; as he went up the hillside, his quantities would become greater. When I say the land would be
parallel with the South Shore, I mean generally, not exactly.
184 I included, also, the excess cost for waterways and minor drainage. The question of classification at Houghton is difficult, as the slopes are in a condition of nature, covered with timber and brush. I assume that there would be a considerable percentage of classified material—that probably one-third would be classified material, at an average price of twice the earth work. The fact is, there is a possibility of finding rock, undisclosed today. I assume there the lightest line would have 487,000 yards of total pay earth, 40,000 to 50,000 solid rock, and a considerable amount of loose rock.

The line at Marquette was one which followed the contours among the hills, to the nearest point where there was suitable ground for a yard at Marquette. This yard would be, perhaps, 1.5 miles from the present yard. I also assumed the line among the hills terminating at the present southeast yard. That involved less quantities, about 300,000 yards, the estimate for that being slightly over $260,000.

For a distance of a half mile from Chocolay River toward Marquette, the ground is flat, considerable swampy, and from 15 to 20 feet above the lake level. There is also considerable flat land at the Carp River, to use which would require a considerable fill.

The southeast yard of plaintiff was the yard of the Marquette &

Western. The D. M. & M. came into the same point, while the west yard was that of the M. H. & O. The combination of the three roads into the D. S. S. & A. resulted in the two yards. The main receiving yard for ore is the west yard, while the other yard is in use as the principal freight yard and for empty ore cars.

(Witness testifies to changes in mileage of branch line, June 30, 1911, to June 30, 1913, resulting in increase of 15.41 miles.)

185 All of the branches stated are freight branches, and a considerable amount of branch line has disappeared and been replaced by other branches in the two-year period; that change goes on more or less every year in operation. Every railroad has a constantly changing mileage of such secondary tracks as these. There are no passenger branches, except the Republic branch, treated as main line, which is joint freight and passenger, and remains unchanged.

I think the practice of plaintiff is to treat each sidetrack as an independent item, making a charge to additions for all lines constructed, crediting additions and betterments and charging operating expenses for all items taken out. The I. C. C. prescribes the general method of treating this account. Plaintiff keeps accounts of each separate sidetrack.

I am not clear that my answer, that it was charged to operating expenses, was correct. I think the practice is to credit additional and betterments with the line taken up and charge operating expenses with the actual cost, if known, or the estimated replacement cost, as of the date of the change.

In filling structures whose height exceeds 20 or 24 feet, it would cost more to make the fill than the value of the structure in the 1911 appraisal. If it was a low structure, eight or ten feet high, the cost of replacement would exceed the cost of filling. The fill makes a better structure; the trestle is still in, but the fill alone is appraised. The structure makes it possible to fill at less cost than if there were no trestle in existence.

I made no investigation of the actual cost of moving the yardage to fill these trestles and bridges. Plaintiff has been doing a very large amount of work with steam shovels and trains, not only

186 filling these trestles, but widening the shoulders of fills, in connection with the re-ballasting operation; this work has gone over a period of several months, and a great deal more money, in the aggregate, has gone in than has been included in the appraisal. Much of it is in the nature of replenishment of banks, and I have made no attempt to add anything of that sort. I have made no attempt, whatever, to analyze the costs of plaintiff's work.

The strengthening of bridges and trestles by adding new stringers was to permit the safe use of larger locomotives. The typical construction was two stringers under a rail; a third has been added, adding substantially 50% more carrying capacity on all the wooden structures. This was done to all main line bridges and trestles, except a few.

Mr. Cadarette reported the additional timber. After inspecting every bridge, the quantity was estimated, and the unit prices applied.

There was no attempt to ascertain actual cost, though that was considerably in excess of the cost of placing the stringers if the bridge were built new. The cost of additional stringers should have been carried as additions and betterments; there might be a fairly intelligent estimate of the actual cost made, but I made no attempt to do so.

Bridge 186, page 50 of Complt.'s Ex. 1, Riggs, was built over, new, since 1911. That was in, in 1911, at, cost of reproduction, $2,167, and present physical value, $1,182, or about 50% of condition.

Bridge 179, page 50 of Ex. 1, had timber abutments and trestle. It was given concrete abutments, and 109 feet filled, and was carried it 1911 at, C. O. R., $3,524, and P. P. V., $2,706.

187 Bridge 94D has been replaced by a new bridge, and is in, in 1913, at $18,830. I do not know whether that is actual cost. The previous structure was, in 1911, C. O. R., $7,514, and P. P. V., $3,809—50%, except iron.

Trestle 240, page 76 of Ex. 1*a*, was entirely rebuilt in 1911; C. O. R., $323, and P. P. V., $166; timber 50%; iron 70%.

Bridge 20D, page 57 of Ex. 1, given concrete abutments since 1911, was carried in 1911 at, C. O. R., $1,220, and P. P. V., $1,040; it is now carried at a lower cost of reproduction, and is a better structure; as the price is less than the old one, there would be no charge to additions and betterments.

Trestle 295, page 84 of Ex. 1. C. O. R., $1,428; P. P. V. $749; given new plate girder and 79 feet filled.

Bridge 314. The steel was strengthened, at a cost of $7,005, to take care of heavier equipment; it was a rather light structure.

Bridge 317, page 62 of Ex. 1, entirely rebuilt, and 177 feet filled; in 1911, C. O. R. $10,430, and P. P. V., $5,789; timber, 50%, and iron, 74%, in 1913; cost $18,500, which I think does not include filling.

Bridge 319, page 63 of Ex. 1, entirely reconstructed, and 353 feet filled; in 1911, C. O. R. $11,593, and P. P. V., $6,465; timber, 50%; piling on abutments, 64%; trestle approach, 54%; iron, 77%.

Bay Mills trestle, page 74 of Ex. 1; 1911, C. O. R., $73,410, and P. P. V., $38,501; timber, 50%; iron, 62%; omitted from 1913 appraisal. The use has been discontinued. The traffic doesn't warrant maintaining the line at Bay Mills, and extensive repairs would be necessary to put the trestle in condition—more than is justified by the traffic.

188 There were 73 new closed culverts in 1913 appraisal, all on pages 29-34 of Complt.'s Ex. 1*a*, Riggs—given the same numbers as in 1911. These structures are all new construction since 1911. Two culverts built prior to June 30, 1911, were omitted in 1911; they are, page 32 of Ex. 1*a*, C. O. R., $1,349, and P. P. V., $1,285, and page 33 of Ex. 1*a*, C. O. R., $4,629, and P. P. V., $4,346. Of the 73 new closed culverts, some are clearly replacements of old timber culverts, in in 1911 appraisal and taken out. Possibly a few are new where there was no previous structure.

Tie prices were increased from 34 plus cents to 40 cents; the hauling price is included as 5.5 cents, made up of the same items as in 1911, and intended to cover handling from point of delivery on line along-

side road to material yard and to point of use. The material yard is the point of distribution.

I allowed one cent for inspection, and for loading, unloading and handling—loading the tie from the track on to the train to carry it to point of distribution, and unloading at that point—2¢, and transportation 2.5¢. The transportation out from the point of distribution would be in track laying and surfacing—not in this item.

In getting the 1913 price of 40¢, I took a simple average, and did not weight the averages as between the classes of ties—cedar, tamarack and hemlock. The average thus obtained was used as the basis of my judgment. In my judgment, the 40¢ price is conservative, and very much less than should be used on the assumption of reproduction, as it is practically within a fraction of a cent of what the company has been actually paying, assuming the 5.5¢ for handling, etc., correct. Reproduction would involve a much larger market, with more difficulty to secure ties, and, unquestionably,
189 the price would go up materially, so that, on a strictly correct reproduction basis, the price ought to be nearer 50¢. This is due to the fact that the demand for ties produced by a large amount of construction would increase the price.

The 40¢ used is 3.06¢ higher than the actual cost of tamarack ties for a five-year period, allowing arbitrary of 5.5¢ per tie for handling. A small percentage of the ties purchased in last five years were tamarack; I don't think more tamarack than cedar were purchased. I haven't the figures here indicating tie purchases, and possibly I spoke a little too positively; but there have been large purchases of cedar, very much larger of hemlock and, in some years, the cedar purchases exceeded the tamarack. When I say purchases, I am referring to ties laid.

The 40¢ is .73¢ higher than average cost of hemlock ties laid for five years, after allowing 5.5¢ arbitrary and 4.23¢ under average for cedar ties. Tamarack is 36.54¢, hemlock 39.27¢ and cedar 44.23¢. The additional ties in 1913 is due to 15.41 miles of branch line.

If actual prices of ties bought by plaintiff in small lots during last six years were computed, the average prices by reason of the large number of hemlock and tamarack ties would, if applied to all the ties on the road, produce a figure lower than the 40¢ price used. I have made no computation to find the amount of that. I do not believe such computation would be a correct method of arriving at the value of the ties on the assumption of reproduction; if that were to be done, the same thing should be done for bridge and other ties, where I haven't used the excessively high price. My 40¢ price is affected, to the extent of .75¢ to 1¢ a tie, by the increased price due to reconstruction.

190 There has been very extensive re-ballasting west of Marquette, the work consisting of widening many of the embankments, filling out some sags, and re-ballasting. This territory had been previously ballasted, and, except as there may have been a few miles of sand ballast track lifted, it was in the nature of re-ballasting, and no change was made by me, as substantially all the mileage had been included as ballasted, and because ballasting was not de-

preciated. I did not consider that I was justified in making any addition to the appraisal by reason of this work of re-ballasting, which, in effect, in some places, goes almost to the extent of a change of grade. Minor sags have been lifted out, up to a height of two or three feet. The only additional ballast quantities are due to the added 15.41 miles of branches and .75 miles of side-tracks.

In Michigan, over 50 miles, from Lake Gogebic east, was ballasted in the years 1912-1913; there was also some work being done near Thomaston, and east. The 50 miles done the previous year (1912) was from near the state line, or from Thomaston, east. It was necessary to do that, as the main line from Nestoria to Duluth in 1911 was much more nearly like a branch than the Houghton branch; that is, the high class maintenance had been on the line from Marquette to Nestoria and Nestoria to Houghton, and, while the line from Nestoria to Duluth was in safe operating condition, it had reached the point where it needed considerable tie renewals and considerable track surfacing, and some rail changes, and it was not what would be called a high class main line track, suitable for the running of sleeper service.

It was not in quite as good condition as the line east of Marquette, in the maintenance of joints; there was more hammering noticeable. Then, too, there were a number of stretches of track that had minor sags which have been taken out, and the property has gen-
191 erally been having a thorough re-surfacing and bringing up of condition, to permit the running of faster passenger trains, and improve the passenger service, I judge, and to permit the hauling of heavier freight trains. I think it was, to a considerable extent, to permit the advantageous use of the new locomotives, and to a considerable extent there has been an increase of tie renewal that might be traced to the use of the heavier locomotive. The renewal of the stringers on the bridges was due to those locomotives, wholly. The new ballasting west of Marquette would vary all the way from a two or three inch lift up to as much as three feet, with, perhaps, an average of seven or eight inches; I may be a little high on my average. This is all gravel ballast.

The Marquette passenger station is located wholly to passenger business. The second story is used for offices of Superintendent, despatchers, Car Accountant, roadmasters and map room, and is in common service as between passenger and freight. The lower floor is exclusively used in passenger service. The greater part of the expense of the building has gone to the passenger service. Any building as modern in character, and giving the same amount of space to passenger service, and no space to offices, would cost a greater part of the money that has gone into this structure. In this case, the general service is incidental, and the primary reason for the building is the passenger service.

I don't think that rule should be applied to allocations throughout this case. The application of the same rule, as just stated, to the Dead River railroad, would assign a small portion of the Dead River railroad to common; this would assign a small portion of a depot to common. It seems to me it would work back with equal fairness to

the Dead River railroad proposition—that, in a way, they are somewhat similar. There is no question that there should be some
192 allocation of the passenger station to common; I don't know how to make it. The officers and people using the upper part of the station have to cross the land upon which the building is located, coming in, on the same class with the passenger, from Third or Front Sts.

The dispatching done from this upstairs of the Marquette station may extend over the whole road, to Duluth. Certain of the general officers located there have supervisory duties over the whole road. The dispatching done there is for all classes of service, including ore, as is the Superintendent's and roadmaster's work.

Certain general officers are at Duluth. Ordinarily, throughout the appraisal, where there is a passenger station and separate freight building, I have allocated the passenger station exclusively to passenger service and freight building exclusively to freight, notwithstanding there are telegraph offices and agents' offices at both. There is a telegraph office used incidentally for Western Union business, and also for dispatching, in many of the buildings allocated to passenger. I wouldn't expect it to be the general rule that the telegraph offices are in the passenger stations; on most roads, it is the other way. There are telegraph offices in the freight stations at St. Ignace and Ishpeming, and I think in no others. In the smaller stations, that have telegraph offices or instruments, the work is done from the passenger station.

The general rule is, in railroad practice, to employ one man as agent, who solicits and cares for freight business and sells tickets and does telegraphing. He may have one or two assistants, and will use the one office that is provided, generally in the station building, combination or passenger depot, as the case may be. Only in the larger towns would there be a passenger and freight man, and I
193 wouldn't expect to find a man employed for exclusive freight in any of the small towns on South Shore. In general, where a station is subject to use by telegraphing and dispatching, and the only agent has his office and headquarters in the passenger station, I have made no separation so as to attribute any part of it to the freight business.

In schedule 19, I have made no changes in price, except in one instance, due to erroneous description, in 1911. The new enginehouse at Soo, $22,046, replaced the old enginehouse, carried in 1911 at, C. O. R., $28,800, and P. P. V., $23,040; the number of stalls was reduced from 16 to 12, and half the cost was assigned to South Shore in the new structure, but all of the old, which was erroneous. At the Soo, there were a roundhouse and a cinder pit eliminated, and there was a new roundhouse, cinder pit and other new structures. All of the new buildings at the Soo were included at cost.

The 1913 appraisal shows a new enginehouse at Thomaston, $16,370, not completed June 30, 1913, included at cost, and having 11 stalls. The amount stated is the cost to June 30, and the total cost will be around $30,000. The old enginehouse at Thomaston contains 15 stalls, was appraised in 1911 at, C. O. R., $24,000, and

P. P. V., $18,000, and has been torn down. The old house was in need of a new roof and doors, and the depreciation accrued on it. $6,000 was sufficient to put it in shape to run for many years, but that and the house at the Soo were both scrapped, because too small for the new locomotives; the depreciation by obsolescence was complete between 1911 and 1913.

It is 16 miles from Thomaston to west state line; there is an enginehouse with four stalls at Superior, but no others in Wisconsin. There is 107.15 miles of main line in Wisconsin, and the enginehouse is located at the extreme end of the line there.

194 I made no allocation to Wisconsin of any property located in Michigan, and attributed no part of the Thomaston roundhouse or Marquette shops to Wisconsin. The shops are common to the whole road. Thomaston is 86 or 87 miles from Nestoria; Thomaston is a division point, service running there to Duluth and east to Marquette; a part of the service runs straight through. The Thomaston roundhouse would be used in handling locomotives running from Thomaston to Duluth. The shops at Marquette are the only general shops on the line; there is a small equipment of tools—a few hundred dollars' worth—at Superior, for making repars to equipment to carry it back to Marquette, but all rebuilding and major repairs, as to cars, locomotives and miscellaneous equipment, are made at Marquette. There is repairing equipment at Houghton, the Soo, and at various points along the line.

No part of the Marquette shops, or ground on which they stand, or tools or equipment in them, has been assigned outside of Michigan; a division between states on some basis of use might be arrived at. The work of these shops is mainly on rolling stock, but they do all of the cutting and trimming of rails used as relayer. I am inclined to think a track mileage basis would assign an overly large proportion to Wisconsin. The assignment should be on the basis of use. I think the records of the shop operation would disclose some equitable basis.

The new coaling station at the Soo, costing $6,650, superseded one carried in the 1911 appraisal at, C. O. R., $6,082, and P. P. V., $4,234—timber, 65%; embankment, 100%.

I allocated the right of way to ore dock No. 4 to exclusive freight. It is now being used for the delivery of freight to the Roach & Seber warehouse. It will be possible to develop a business on that
195 track, and it is not necessarily limited to one warehouse. I do not think that the business of that one warehouse would justify plaintiff in buying the land at the figure named by me in 1911 and building the track to it, but I believe that business may be developed which will justify the continued ownership and maintenance of that track.

I don't think, considering the warehouse and the stores abutting on this track, that the track would ever have been put there without the ore service, on account of its involving an expensive subway. The point of connection of No. 4 ore dock track runs half way into the block between Fourth and Fifth Sts., allocated entirely to common.

There is, perhaps, 40 or 50 feet of track outside the clearance in that block, allocable to freight.

I made no attempt to make detailed comparison of original costs—the records were not available. I have tried it several times, for small portions of line on other roads, and some years ago came to the conclusion that such method of appraising is impossible.

We know certain things that would make the original cost higher than the present cost, and other things to make it lower; to know whether it would cost more or less now than 30 years ago, and to give definite final answer, you must have all of the elements of unit prices as of the time of construction, and practicaliy make an estimate as of that time. Until you have that, any figure of estimated original cost is in the nature of a guess. The largest item in the last analysis is labor; the ties, rails, timber, etc., have labor in them; in its last analysis, if all the structural materials in the South Shore were taken in a state of nature and reduced to the condition in which we find them in South Shore, over 90% is labor. I investigated no prices on South Shore, from its books or otherwise, of any of its construction 15 years ago.

196 I did not intend to make as sweeping a statement as you seem to have construed it, to cover the general cost of the road; I said that I felt that, owing to the piece-meal construction, and owing to the condition of the country, having been covered with timber at the time of original construction, and thereby adding greatly to the cost of earlier surveys, and especially the piece-meal construction and the large structures, I was quite certain that, if original cost of engineering could be shown, it would be in excess of my estimate; but I did not intend to go so far as to say that original cost for the help would necessarily be in excess of reproduction, although it might be—there is a possibility.

My 4% for engineering was intended to cover everything, including preliminary. I think it conservative—low enough, and fair. On 30 miles in Indiana, the cost was 4.25%, and I have known the percentage to go as low as 2.75%. The average, I should say, at present, is considerably in excess of 4%; that is fair for such a property as South Shore, and would be high for a railroad in the west, where the country is open and construction light, and low for work like Lackawanna is doing in New Jersey.

In construction of South Shore at present, the cost would be likely to go above 4%; engineering has increased in the last 12 to 20 years, due to more complete engineering; employees are higher, and there has been marked increase in the employment of high class consulting engineers.

Description 13, Marquette County, Complt.'s Ex. 1*b*, Riggs, and Complt.'s Ex. 6*a*, Riggs. There is a little more than half the land owned by the railway company west of the westerly track that is not in use for railway purposes, and that is in a state of nature. On the north line of Ely lot, it extends 300 feet and on the south line

197 250 feet from the most westerly track to the back end of the lot; one-third of that is in use, carrying embankment, and the

balance would have to be acquired in acquiring the front, and is necessary for any extension of the yards that may be made.

Description 14, Marquette County, 850 lineal feet of water front outside the breakwater. When breakwater is completed, this will be well inside it. The greatest width of this water front from the most easterly track in the hard land is, at the point of rock, 250 feet. There are no structures of any kind on this water front. It would require the removal of considerable solid rock to put any railroad structures on the northern end of it.

Description 15, Marquette County. (Quotation from affidavit of witness of April 12, 1912, in which it is stated: "He included in his inventory another tract which lies on the lake front * * * valued on the basis of its foot frontage." Some of this tract is used for railroad purposes, but the exact acreage deponent cannot now tell.) I had in mind, in making the affidavit, the riparian rights of the water front opposite Burt and Fly's Add., where there is no use of riparian rights, and the non-use of a small amount of land between the site of ore dock No. 1 and the Ely lot; that would fall on descriptions 22 and 14.

Description 33, Marquette County—also 32. These descriptions are, in part, used as piling ground for material. That material would be included in stores and supplies, which were located between Wisconsin and Michigan on track mile basis.

There is a constant change going on, on every railroad, in the length and location of side tracks; some are more or less temporary, and in some industries there is more or less steady shifting of
198 track. There is a frequent change of sidings which serve the mines, so that every year there are three or four miles of side track taken up and a corresponding amount laid in some new location.

In cases of the establishment or abandonment of an industry, there may be a large increase or decrease, but the normal changes on an estimate won't vary much from three to five miles a year. Passing track and yard tracks are more permanent, the changes being likely to be additional tracks.

RIGGS.

Redirect examination.

By Mr. Eldredge:

As to the line from Pilgrim River to Houghton, I have assumed that the land acquired by plaintiff in acquiring its right of way, and between the highway and the railroad, might be available outside the limits of the actual roadbed of the South Shore, and I have assumed the use of such portion of the terminal as might be used without interfering with existing tracks or buildings thereon. I will lay out the proposed line on a map, and furnish it to defendants.

I took into account possibilities of a line from L'Anse to Houghton. In my judgment, it is impossible to get any line crossing the

range of hills that runs back from Houghton for a number of miles, without heavy work, excessive length of line, and greatly increased expense. It is impossible to get a line in the hills near Houghton without much heavier expense than involved in paralleling South Shore. There is no difficulty in locating a line to Chassell, and from there to Pilgrim River, which would be substantially equivalent of South Shore in cost. The line I have estimated was upon the cheapest line, Pilgrim River into Houghton, and provided a suitable yard at Houghton. I considered lines commencing east of
199 Pilgrim River, but did not lay them out on paper, or prepare profiles or estimates, because a line in any other general location than that of South Shore would involve longer distances, heavier territory, and greater cost. This I was able to determine from general knowledge of the country, without reference to profile maps.

In Wisconsin (at Superior) are six roundhouse stalls. Six or seven stalls at the Thomaston house will, with the Superior house, house every locomotive engaged in interstate business. There being 13 allocated to the interstate traffic between Michigan and Wisconsin, and taking into account the engines in service on the road, six stalls at Thomaston and six at Superior would be more than ample to care for the present interstate business. I think no engines are engaged exclusively in Wisconsin business.

I have often made estimates upon the basis of time required to do the work, the number of men employed, and probable cost. In fixing a price I was making for engineering work to be done, I have several times been called upon for such a figure. I have so estimated the cost of engineering work of which I was to have charge. My adoption of 4% for engineering was based upon my experience in engineering work and knowledge of engineering cost. I cannot say that any computation, estimating the number of men required, etc., has led me to this particular 4%. Where I have made a computation, the percentage has varied, depending on the size and character of the work, from below 4% to as high as 10%. The difficulty in estimating in such an instance as this is the large and expensive structures; if they could be eliminated, it would be comparatively easy to estimate the engineering required to reproduce the line, grade, bridges and ordinary track construction.

200 On description at the Soo, there was allocated 1.5 acres to passenger, 8.91 acres to common, 1.65 acres to freight, and 5.39 acres questioned. A correction should be made, deducting from the common 4.9 acres, and transferring it to freight, making the common 4.01, freight 6.55, passenger 1.5, and questioned 5.39. With this change, parcel 7 is correctly allocated; the dividing line is erected at right angles to the center line of the main track. That covers all changes at the Soo in addition to those made at the hearing, except the allocation of sidetracks.

At St. Ignace, on description 7, 72 acres should be transferred from common to exclusive freight.

At St. Ignace, a portion of description 8 should be allocated to freight. I have allocated the north freight yard, that portion of

the description north of the main track, 6.72 acres, leaving the balance of 49.81 acres common.

Description 5, Complt.'s Ex. 6*a*, Riggs, Marquette. In stating no riparian rights are used here, I meant there is no track on this land, and no construction from it into the water. The hard land is essential as supporting the track immediately adjoining in Lake St., and the entire frontage has been riprapped with stone by plaintiff, which stone extends into the water. I included nothing in this appraisal, or in 1911; Mr. Hansel included $1,700 for riprapping on this mile. In stating there was no use of riparian rights, I used the expression bearing upon the fact that there is no structure into the water for commercial purposes, or connected with navigation.

201 Description 7, Complt.'s Ex. 1*b*, Riggs, Marquette County. I have extended the land allocated to exclusive freight to a point closer to the main line; I would change the allocation by giving 15 lots to common service and 32 to exclusive freight.

Description 12, Complt.'s 1*b*, Riggs, Marquette County. Corrected to transfer four lots from common to exclusive freight. I have put all the land to the west of the main track, laying off half the distance between the main track and the next track westerly, extending from Jackson to Mesnard Sts., and assigned everything west of that land to exclusive freight.

On January 19, 1914.

RIGGS.

Cross-examination resumed.

By Mr. Wykes:

In Complt.'s Ex. 1*c*, Riggs, I have followed Complt.'s Ex. 1*b*, Riggs, in allocations of land as between non-railroad use, passenger, freight, ore and common. Ex. 1*c* sets up in parallel columns the land descriptions as appearing in Complt.'s Ex. 1, Riggs, 1911, Defts.' Ex. 15, Hansel, 1912, and Complt.'s Ex. 1*b*, Riggs, 1913. On Ex. 1, the parcels were not numbered; I have now numbered them, beginning with number one, at the top of, and running consecutively through, each page.

Mr. Hansel's numbers start with item 1, and run continuously through the land description. Complt.'s Exhibits 1*b* and 1*c* begin a new series of numbers for each county, and run consecutively through the county. Ex. 1*c* permits comparison of the land included in each appraisal.

I have placed no land values since Complt.'s Ex. 1. I have prepared a statement showing each sidetrack, with length, allocation to class of service, and, where freight sidetrack is located on land allocated to common use, the acreage that should be allocated to freight by reason of the sidetrack. This involves a change
202 of classification of a large number of small items of land, aggregating, perhaps, 75 acres. In my previous exhibits, where an exclusively used sidetrack fell on main line right of way, I made no allocation of the ground on which that sidetrack was

located, but treated it as common, invariably. The exhibit I have now prepared locates such land as between passenger, freight or common.

Where an allocation of property becomes necessary, it is consistent to make an allocation of land occupied by freight sidetracks to freight, though many of these sidetracks are temporary in nature. In the great majority of sidetracks, the amount in dollars and cents is comparatively unimportant.

I made no further allocation in Marquette, as I think those already made cover all the land occupied by exclusive use tracks, where it is possible to allocate land to the freight service. In certain classes of track, no allocation can possibly be made to freight; e. g., a crossover between two main lines may be used exclusively for, and be properly assignable to, freight, as far as the track is concerned, yet the track occupies common land, and may be so located that it is impossible to stand a freight car on it without interfering with the movements of trains on the common track.

There are 15 or 20 such tracks on the line in Michigan; the same thing is true of a hundred or more feet of the length of every sidetrack, where it leaves the main line. It is impossible to allocate to freight land occupied by main line track and necessary to the passage of a train over the main line. These instances, while numerous, cover a small acreage of land, if the allocation to freight is made to run through (to) the clearance line of the main track. All sidetracks, spur and branch line lengths are measured from the point of the switch. In allocating land under sidetracks to freight
203 use, I have taken a line seven feet from the center of the main track as being the limit of actual use by the passage of a train over the main line, and have assumed a total distance from the point of the switch to the clearance line of about 150 feet.

For sidetracks which lead off the right of way and do not parallel the main line, I have assumed a width of 25 feet, and have allocated an irregular parcel, 25 feet wide, commencing opposite the point of the switch, giving a narrow strip of land there, widening out to 25 feet, 150 feet from the point of the switch and full 25 feet from thereon. The 25 feet, in my judgment, properly covers the track and embankment. For sidetracks paralleling the main line and remaining of the right of way next to the main line, I have taken a strip of land running from the seven foot clearance line out to the right of way line, commencing at the point of the switch and running through to the point of the other switch, giving not only the land occupied by the track itself, but all of the land to the right of way. This, I think, gives rather too much land to the freight, but it is done on the assumption that access to the sidetracks is necessary to unload cars, and that such access is freight service. Where tracks are used for storing cars, this would assign more to the freight than was actually used. A small triangle at each end, opposite the point of the switch, is, in reality, common.

My first allocation was on the idea that the freight track was a temporary facility, and that its presence did not interfere with the entire use of the right of way by the joint service; but, if allocation

is to be made, I do not see that it is inconsistent to allocate the land under freight sidetracks to that use temporarily. In every case, I assumed that the point of clearance would be 150 feet from the point of the switch.

204 In the allocation of sidetracks and spurs, the items of construction are the track, and any allocation made of the track would carry with it all items in the schedule that pertain to the track; this includes clearing and grubbing, grading, ties, rails, track fastenings, track laying and surfacing, ballasting, etc. The land, except switch leads and cross-overs, may or may not be allocated to the sidetrack or spur; that is a matter of opinion; I see no inconsistency in doing so, but I do not see how any allocation of land within the limits of clearance of the main track can be made to sidetracks.

On page 126 of Complt.'s Ex. 1*a*, Riggs, official cars are allocated as passenger; I think those should be considered as common. I have allocated no locomotives to ore service; some locomotives are used for a part of the year in exclusive ore service, but during season of closed navigation the major part, if not all, of that equipment is used in freight service. If any are allocable to ore, the number is small, and due to the fact that such locomotives would be out of service when not in ore use.

The allowance of 1,300 feet beyond the end of the switch at stations was to permit the working of trains on the main line, going into or coming out of the yard. A passenger train of five coaches would be 360 to 400 feet in length.

In making 1913 exhibit and inventory, a more careful survey of the road was made than previously. I cannot give you the items found in this more careful inspection, that are omitted from 1911 appraisal; that will show up on a comparison.

The instances which I have in mind of items that were omitted were two quite large culverts, which were not included in 1911—the double lines of 48 inch pipe on the Houghton branch and the concrete culverts just west of Marquette yards, both of which

205 were put in prior to 1911, and omitted (evidently, C. O. R. $4,629, and P. P. V. $4,346, on the first). There were also quite a number of minor structures, in buildings, that we found.

I do not think, now, of any items of appreciable size left out in 1911 and found in 1913, that I have not already testified regarding. I feel that, in the main, the 1911 inventory is a creditable inventory; there were a few errors of omission, and a few errors of inclusion of items not properly included, and those, I think, have mainly been corrected in 1913.

I don't think the tickler noticed at Marquette as having been omitted in 1911 was included. I think it possible, if time were spent, covering the ground, and taking several weeks, for a full inspection and a careful checking of the inventory, that it would add a large number of minor items, like that tickler. The riprap at Marquette and at Michigamme was again omitted in 1913; it should be in. The masonry for a bridge at Iron Bridge, or at one of the Ontonagon River crossings, omitted in 1911, has, I think, been corrected. The minor items, such as the tickler, which, if new, might

amount to $400 or $500 for the whole road, road crossings and structures of that sort, that we omitted, would not amount, in the aggregate, to any great sum. I feel that the large items are substantially correct.

You asked me a question in regard to omissions from the 1911 inventory, and I have in mind the fact that you wanted the buildings. Now, I have looked over some of the other schedules, and I noted a few of the omissions in the 1911 appraisal that I would like to call your attention to, in connection with my answer to the question last night.

In the land, there was omitted, in 1911: Fiborn Quarry branch,
22.75 acres; track rights, Lake St., 7,416 feet; Marquette
206 Quarry right of way, .87 acres; Negaunee and Palmer branch
track rights, 5,400 feet; Mary Charlotte branch track rights,
4,400 feet; Milwaukee Mine branch track rights, 9,200 feet; gravel pit, Covington, 20.3 acres; all included in 1913. Lot 6, block 4, Ishpeming, omitted both in 1911 and 1913. (Several of these were discovered and inserted in the course of the 1911 appraisal or testimony.) The riprap at Marquette and Michigamme was omitted both in 1911 and 1913.

In 1913, there was intentionally omitted the work that has been done since the appraisal of 1911 in connection with the widening of fills, and so on, 70 miles of line west of Nestoria; a very considerable yardage of earth has been added in that work. I think it should appear under grading, and, in case of a re-measurement of all earthwork on the road, would, in my opinion, very greatly increase the number of cubic yards of earthwork, as estimated. It was done in connection with re-ballasting. I added nothing to my ballast estimate on account of the new ballast; nor the graduation on account of it. I know, and was over, the general territory covered; I should say it was in the hundreds of thousands of yards—a large yardage.

In bridges, trestles and culverts, there appear in the 1913 schedule 73 culverts which do not appear in the 1911 appraisal, all of which have been built within the last three or four years; how many of these were in place in 1911 I have no means of knowing.

Additional braces were added to bridges, making a very considerable increase in timber, but the difficulty of securing the data to make a reliable estimate was so great that no attempt was made to do it.

In 1911, there was no inclusion for bridges, trestles and culverts
on branches; nor is there any in 1913. There was, in fact, a
207 num'er of culverts on the Palmer, Dead River, Mary Char-
lotte and Weidman branches—not large, any of them; the largest is, perhaps, 10 or 12 feet opening.

On my last trip to Marquette, I noted, in connection with the track approaching the roundhouse from the west, two long culverts, built of logs, an aggregate length of 250 feet, not included in either appraisal. No allowance has been made for furniture or property of plaintiff in Detroit, or in cities other than those along the line of the road, and no allocation has been — to Michigan of any of the general office property located in Minnesota.

Plaintiff has two or three gasoline motor cars which were not included in 1911 or 1913. It also has 12 or 15 track velocipedes, costing $35 to $40 each, not included in either valuation. In 1911, a considerable amount of snow fence was omitted. In 1913, the 1911 schedule of roadway and construction tools was adopted, without change; owing to the large number of extra track forces, there is a considerable increase in the amount of these tools. There is no inclusion in 1913 of piping for the pintsch gas at Marquette or the Soo.

In 1913, the old dining car included in 1911 had been rebuilt, and it was included in the 1913 appraisal at $2,000, which is ridiculous; the car is worth several times that. In neither valuation are items of car cleaners' tools, and numerous minor items, which might be enumerated, and which must be there.

A 650 foot siding at Negaunee, north of the north main track, past the passenger depot, has been changed in allocation from freight to common, it being used for storing both freight and passenger cars.

208 Of the velocipedes which I have said were omitted, I have seen velocipedes on the road, and find the engineering department has two or three, the bridge foremen and linemen some, and each roadmaster one. I do not know whether they have 10 or 15, altogether; the cost is $35 to $40 each. I understand there are three gasoline motor cars, acquired since the 1911 appraisal; I do not know the cost.

As to the furniture in the offices of the line, I do not know what they had in the way of offices, other than at Detroit. My information about the Detroit office is by having seen the sign. I do not know who holds the title to the office property.

The tools which I say were omitted are capable of inventory.

The pintsch gas pipes are capable of inventory, and have been installed at the Soo since 1911 appraisal. There were items of property included in the 1911 appraisal that were omitted in the 1913 appraisal; they were included in 1911 on the theory that I should include in the report all the property in the service of the *property* and transportation, or which was, in my opinion, reasonably necessary for that service, or which had been or might be used, on the theory that the question of inclusion or exclusion of items of value was not an engineering question. I made no explanation of the use of any item in either 1911 or 1913 appraisal, except as I have testified regarding it. I included quite a few items in 1911 excluded in 1913; e. g., the Martel furnace lands and tracks.

Of land, I have omitted quite a considerable number of descriptions that I included before. Items that have been marked as "questioned," and not allocated to freight, passenger or common service, and which are not in use today, and were not in 1911. In minor instances, lands not in use today were in use in 1911, and vice versa.

209 RIGGS.

Redirect examination.

By Mr. Eldredge:

I have allocated the land occupied by sidetracks which are used for freight and passenger service, and allocated in Complt.'s Ex. 1*a*. Riggs; where land occupied by sidetracks was not allocated in Ex. 1*b*, I have now allocated land occupied by exclusive freight and passenger sidetracks on such unallocated right of way.

These totals do not include allocation to freight or passenger made at the previous hearing, on the map, and which are allocated in Complt.'s Ex. 1*c*, Riggs. They do not include allocations of sidetracks, where the lands on which the sidetracks rest have been allocated to the same service as the sidetracks. They are additions to allocations made in Ex. 1*a*.

RIGGS.

Recross-examination.

By Mr. Wykes:

Passing tracks on South Shore would average about six miles apart; some are less, and some slightly more. The passing tracks are all located to common, and run in length from 1,400 to 2,000 feet. The length of the passing track is regulated by the length of the train which must pass. The freight train, being of inferior class, always takes the siding as against the passenger train; that is not invariable, as, in the case of an extremely long freight train, or where the freight train load is practically at the limit of the locomotive tractive power, the passenger train is often sidetracked.

The meeting of two freights and a passenger, or two passengers and a freight, or a regularly scheduled meeting point of two passenger trains, with any other trains, in the yard, would make the two
210 tracks desirable. I feel confident that the amount of passing track allocated to common is not excessive, and that it would not be excessive assuming the elimination of freight traffic and the necessity of operating passenger trains under conditions of weather and delays likely to be encountered in the Upper Peninsula, with reasonable prospects of getting trains over the road and making up time. I mean that moving passenger trains, frequently late, which have to make up time, requires frequent passing tracks, that the road may be clear, and that with any passenger movement in the opposite direction long space between passing tracks might, or would, seriously delay the passenger movement.

In other words, the passing tracks should be close together, to permit the trains to run as close together as possible before taking the siding. Having them within six miles of each other permits you to give a free running space of 10 to 15 miles, or even less, while under other conditions it might take 30 miles.

RIGGS.

Redirect examination.

By Mr. Eldredge:

The 20 acres, station grounds at Michigamme, is for the purpose of including the ends of sidetracks and clearance ground at each end; not to exceed five or six acres is used for station buildings, warehouses and other purposes, in the center of the town. In allowing station grounds within 1,200 feet limit, I was not influenced by Michigan decisions as to the extent of station grounds which must be fenced. The acreage was placed for station grounds as being the amount of land within what might be called yard limits—the working limits of sidetracks.

Wherever there is a country village, and a separate item of land, at that point, which includes the total acreage within the side-
211 track limits, and without the working limits at either end of the sidetrack, I have followed this rule. The value of the land had nothing to do with my determination of the limits of station grounds.

RIGGS.

Recross-examination.

By Mr. Wykes:

If you are going to consider clearing as an element of the value of land, as in the case of farm land, where stumps are removed and agricultural land is secured, you must have a good quality of agricultural land, to raise the price equivalent to the amount expended for clearing and grubbing. I apprehend that clearing and grubbing in the case of a railroad cannot be separated from the construction, and, irrespective of what the cost of the land may be, or what the value of the adjacent land may be after it is cleared, the cost of clearing and grubbing remains one of the essential items of cost in building the road, and must be treated in the same manner as grading, or any other expense necessary to fit that land for its use as a railroad right of way or terminal.

On a jack pine plain, where it would be necessary to spend $40 an acre to clear and grub land that could be purchased for $2, I do not see how that would raise the value of your land to $42, as land. It would leave the $2 an acre as an element of value to the railroad for land, and the $40 as an item of construction cost in getting the ground ready to build the embankments.

A strip cleared through a cut-over 40 or 80 acres of land would not add any value to the cut-over lands, as land, any more than the clearing, grubbing and grading of the railroad right of way would
212 add anything to the value of adjacent stump land, or jack pine land, as lands, but I do consider it worth to the railroad what it cost, as an element of construction cost. A strip of cleared

land 100 feet wide through 40 or 80 acres of cut-over land of the character of the shrubbery and timber growing along the South Shore would, if left a few years, be grown over again; this indicates that the item of clearing and grubbing requires maintenance just exactly as any form of track construction does. The right of way must be kept clear, on account of fire; also for the vision of the engineer, the non-interference with telegraph wires, and other purposes. It does require constant maintenance, and an un-sual cutting and burning of the right of way to keep it in the condition now on the South Shore.

On February 21, 1914.

RIGGS, recalled.

Further cross-examination.

By Mr. Wykes:

In comparing the cost of maintenance of main line switches with a through stretch of main line without a switch, there would be considerably more maintenance at the switch, on account of the necessity of always keeping the main line rails in absolutely safe condition at the switch point and the point of the frog. At the location of the switch there is a higher maintenance cost, due to the fact that there is an increased investment at that particular spot.

The cost of maintenance on a mile of track where there are a number of switches would be markedly more, I think, than on another mile, where there are no switches. The number of main line switches outside of the necessary passing track switches would be comparatively small, and I do not think would appreciably add to the total cost of maintenance per mile. The added maintenance
213 at the switch is due, primarily, to the necessity of keeping the main line track in safe condition for high speed movement. A switch in the back end of a yard, with nothing but slow switching movement, does not need or receive anywhere near as much maintenance as a main line switch. The wear on the switch and frogs is due both to main line movements and to sidetrack movements.

Due to the use of the switch, and to the fact that the switch point moves,—is open and closed,—it is absolutely essential to keep that in perfect working order, to permit high speed main line movements over it. Even if there were only movements over it once in a while, more work would be necessary than there would be on an unbroken rail.

All main line switches have lamps, that must be lighted every night and put our every morning; in general railroad practice, that duty falls on one of the station employees, or on the section foreman, if the switch is near a section house—generally, upon some regular employee of the company. At small stations, where there is but one agent and a few switches, it would be a part of that agent's duties to fill, take care of and clean the switch lamps.

The percentages of contingency on terminals and engineering

were, for 1913, 8.8%, and 1911, 7.9%, being, in both cases, the average contingency applied to all other items in the schedule. The increase in 1913 was due to the fact that land, which had borne 5% contingency in 1911, was not included in 1913 inventory.

I made no study of the car or train mileage of plaintiff for any purpose. I did not investigate the relative passenger and freight train mileage, but accepted the passenger and freight train mile as given me by Mr. Delf, and, further than knowing in a general way about how those percentages have run for three or four years, I have made no study whatever.

214 I made no study of the composition of trains, train weights, commodities carried, or things of that kind, whatsoever. I did not, other than as indicated by the train mileage, go into the question of track occupancy by the different services. I made no attempt to determine the time of use by the freight or by the passenger, except so far as I used the train mileage for that purpose. I made no investigation, personally, of either train or car mileage or occupation. I did not investigate the switching mileage, or the stational service.

I did not attempt to separate between the passenger and freight switching mileage other than in the application of an arbitrary percentage. I did not make any investigation of the comparative amount of train mileage, with the commodo-ties carried, in any way. I did not do this, for this or any other railroad, since 1911. I did not ascertain the ore train mileage previous to the testimony in Chicago. I made no investigation, and did not testify in any way, regarding mileage, except as to use mileage figures furnished my by the auditor for making certain arbitrary divisions. I did not examine the increases or decreases, or the relative ratios, of the different classes of train mileage, as between passenger and freight, for a number of years back. I have made no study whatever of the subject of train or car mileage, or traffic.

215 On July 17, 1912.

JOHN D. STRADLEY, a Witness called by Plaintiff.

Direct examination.

By Mr. Eldredge:

I am 66 years old; have lived in Soo since March, 1886. Have been in real estate business since 1886; have abstracted titles since 1888; have bought and sold a good deal of property, for myself and as agent. I know value of real estate at Soo; have bought country lands in Chippewa County; as an abstractor, the prices indicated by conveyances of record came to my knowledge.

I know property owned by Sault Ste. Marie Union Depot Co. (Complt.'s Ex. 3, Riggs, shown witness.) My estimate of its value, without improvements, is $168,000. Have special knowledge of value, by purchasing property adjoining; bought 8 lots last October, Nos. 26 to 33 inclusive, Johnson's subdivision of Private Land Claim 5, fronting Ridge and Emaline Sts. and running through from

street to street, for $16,000 cash. Depot Co. property is of greater value. I also bought part of Private Land Claim 7, 95.6 feet on Magazine St., running 172.26 feet on Emaline St., for $8,500; it is not as valuable as Depot Co. property. In 1910, I purchased part of Private Land Claim 7, lot 8, block 3, of Emaline Wood's Add., and east 11 feet of lot 9, block 3, same, for $17,000 and still hold it.

I made estimate of $168,000 by taking values, without reference to railroad or anything else; if you wanted to buy now, in a complete lot, it would cost more. If the railroad and its improvements were not there, I don't know as it could be sold off at that figure, but if it had to be acquired now, by purchase or condemnation, it would cost more.

I know D. S. S. & A. land extending from Mich. Lake Su-
216 perior Water Power Co. to Sixth and South Sts., averaging 1,175 feet long by 235 feet wide, 6-1/3 acres. I estimate value of that at $16,450. I know land fronting harbor, occupied by yard, width varying from 500 to 900 ft., made land extending into lake, total length 2,800 feet, 46.5 acres. It extends from Sixth St. to east line of American Brick Co. land, which is quarter line of section 12 extended, and is colored white, on plat, with red outline. In valuing that land, I divided it, estimating the water front out to harbor line at $350,000 and the 46-1/3 acres upland at $1,500 per acre average, or $69,750; I made the estimate from lot sales in adjacent additions.

I know land extending west from line of American Brick Co., 1,400 feet by 530 feet, 17.52 acres, bounded in red. I estimated that based on market value, $1,500 per acre, total $26,280. You couldn't buy it for that. I know land, 1,950 feet by 225 feet extending west of property last described to end of joint yards, 10.7 acres, bounded in red. I estimated that at $1,500 per acre, or $15,105.

A description omitted from Riggs' estimate, is D., S. S. & A. lands Portage Ave. to Water Power Canal, indicated in red. It includes 3 pieces, the triangular east of Meridian St., 75 feet on Portage Ave., that part west of Meridian and North of Spruce Sts., and a little piece, about 200 feet wide between Spruce St. and Power Canal. I valued that at $32,600. The triangular piece on Portage is described in Complt.'s Ex. 1, Riggs, as belonging to the M., St. P. & S. S. M.; it belongs to plaintiff.

My estimates of plaintiff's property are based on sales in
217 vicinity. In Ready's Add., lots (6.6 to acre) were held at as high as $500, the average of sales about $400 to $500. Also in South Shore Add., lots (6.9 to acre) held at $350 to $400. Adjacent and contiguous land of South Shore and Soo Line is adapted to same purposes, and of same value. In Chandler's Add., further west on Easterday Ave., approximately in same vicinity, smaller lots run about the same price. Algonquin, Scranton's and Foss & Hyde's Addition, further east, are shown on map. There are 3 or 4 additions further South and West. The Peninsula Land Co. Add. adjoins D., S. S. & A. on north.

I know of sales, at prices named, in all additions except Ready's. From sales and prices at which lots are held, I estimate my value of

the lands; have some for sale there as agent. I have not sold lots lately at prices named, but have heretofore; what I hold now are held at those prices.

I know the triangle (10.55 acres) shown in three pieces in Complt.'s Ex. 3, Riggs, owned by Soo line, bounded on north by Spruce St.; parcel described as 1,320 feet by 887 feet, average, less highway, 24.84 acres; also tract averaging 360 feet by 2,080 feet, 17.19 acres; also triangle bounded by Sixth Ave., South Shore Add., and D., S. S. & A., 8.094 acres; also tract between Portage St. and Power Canal, 7.274 acres, belonging to plaintiff. The value of the 5 last named tracts, a total of 69.687 acres, is $1,500 an acre, or $104,530.

I know the value of the tract between South St. and Power Canal, 16.356 acres, with which I include .57 acre, north of canal and south of D., S. S. & A. This small piece, omitted from the list, is shown in yellow on Complt.'s Ex. 3. The two descriptions are worth $52,-
500. I value them separately, by feet frontage. I have
218 knowledge as to that tract, as it adjoins plats adapted for same purposes where lands are held at prices given. I calculated value by squaring it on a basis of 740 feet frontage on South St., next to power canal, and put the value through entire length at rate of $70 a foot.

I have a general knowledge of lands along South Shore in Chippewa County. I have had over two years' experience in acquiring railroad right of way.

Q. From your experience, how many times the actual value of the land acquired would it cost for the expenses and damages; i. e., what is the ratio between the value of the land in its naked state and the cost of acquirement? (Objection, that there is no fixed relation between value and cost.)

A. Here, where large blocks of land are owned by one party, it would be 2.5 or 3 times as much.

Value of rural lands in Chippewa County along South Shore for right of way, including station grounds outside of Soo, would average $25 an acre, subject to timber rights. If damage and cost of acquirement is added, I think it would cost 2 to 2.5 times as much, or $50 to $60 an acre.

219 STRADLEY.

Cross-examination.

By Mr. Wykes:

I figured terminal company's property in feet by lots; it would be from lots 1 to 18 and 21 to 30 inclusive, in block 1 of Scranton & Robertson's Add. I estimated cost per front foot of these lands I bought, and added a little for difference in value of railroad lands. Lots on the west side are not as valuable as those on east side. I figured at $80 a foot, regardless of depth.

Depot was formerly on Spruce St., way out west end; the business men wanted it nearer town, and they raised a fund to help get it

down there. My recollection is it cost the railroad over $50,000, but I am not sure. Some citizens put as high as $1,500 in pot.

The first tract, 8 lots, 26 to 33, Johnson's Sub., on which I based my estimate of $168,000, fronts Emaline St., across from railroad yards; it was purchased in 1911, at a little over $70 a front foot.

The second piece I purchased, corner Magazine and Emaline Sts., south of freight depot, I purchased in 1904, for $8,500.

The third piece (2 parcels), lot on corner Ridge and Magazine Sts., part of same claim, and lot 8 and the east 11 feet of lot 9, block 3 of Emaline Wood's Add., I bought in 1910. I didn't figure it by foot frontage.

I have been offered a piece, 52 feet on Magazine St., between the two pieces just described, part of private claim 7, for $10,000 cash; they won't take less. The business portion of town is more on Portage than on Ridge—east on Portage Ave. and south on Magazine St.

220 A piece recently listed for sale on corner Magazine (208 feet) and Portage (142.6 feet), just east of terminal ground, the owner will sell for $50,000, or he will sell 125 by 100 feet fronting either street for $37,500.

There is a store building on the south corner of the piece on Ridge St. Buildings are probably worth $2,000 altogether; there are some old shacks on north corner. To purchase this parcel would cost $168,000; it would cost more to buy it if they knew you wanted it.

Another sale in the neighborhood was the east 77 feet of lot 7, block 2, Emaline Wood's Add., 50 feet on Fort St., depth 77 feet, for $1,600. Another sale was the north 30 feet of lot 11, block 2, for $800; the balance of it, 66 by 50 feet, for $1,200. Nothing but some little, cheap shells of houses on them, renting for $6 a month. Another sale was lot 5, block 3, Emaline Wood's Add., for $2,000; also lot 7, block 3, same addition, $2,200; also lot 10, block 3, same addition, $3,500. I think the last is closed; there are two little houses on it.

In the next plat west, Scranton and Robertson's Add., Standard Oil Co., in 1904, bought balance of block 1, that railroad company didn't get—half of lot 31 and lots 32 to 36 inclusive. They paid $3,600, which was considerably under the price paid for the corner, but Standard Oil Co. built a spur and let former owners have rights over it.

I just picked sales recently made. There are many other sales, but they have buildings, which made price higher. I took sales, as near as I could, to get land value without improvements; some cost more, some less. These transactions I know were made, and I know the price.

221 As to the second parcel, a circular piece of 6.5 acres, directly south of power canal, I judge its value on market price of lots in Ready's Add., directly east, and other lots in that vicitity. I didn't see what sales there had been in that addition, or in Shafer's Add., east of that, but know what they hold property at. I have property there for sale at those prices. I have held some without sales for a long time at those prices, and some only a short time.

Lots in Ready's Add. are 35.7 by 105 feet, a little over 7 to the acre; I figured 6 to the acre, at $500, or $3,000 an acre.

I estimated the value of the second piece described, south of power canal, by the lot, on the basis of 6 to the acre, and then put on an average value of $70 a front foot on the canal. That is less than it would come to, figuring by lots. It averages 235 feet wide. I took the Ready lots to get a basis to figure from. I just put that $70 as an average of value, without computation.

The parcel of 46 acres, in which I included $350,000 for submerged lands, runs from shore line to dock line. I figured water frontage at 2,000 feet. I figured it on same basis as Judge Dennison figured lands across canal in the Chandler-Dunbar suit. He figured water front at $550,000 and upland at $102,312. There are no structures on the submerged land I valued. Area of made land beyond dock or meandered line is 7.5 acres.

Another sale was recently made near this; George Kemp bought from Northwestern Leather Co. 250 feet front on dock line by 600 feet deep for $12,500, for coal dock. That is further out than this land we are talking about—all submerged lands.

222 I put $1,500 an acre on remainder of 46 acres, based on value of lots in adjacent additions—Chandler's, Foss and Hyde's, Scranton's, and Peninsula Land Company's subdivisions. They built a $35,000 schoolhouse right next to D. S. S. & A. That shows it is pretty good land. As to the sales in those additions which I took for a basis for my $1,500 per acre, a lot out near Algonquin brought $300 or $400. Those properties are not changing hands much, as they are owned by employees of tanneries and mills. Five hundred dollars was loaned on two vacant lots in block 2 of South Shore Add.

South of the railroad track and west of Sixth St. and Fort Brady, in Foss and Hyde's second addition, are lots held for less money, but none at less than $200; they run from $200 to $400. In Foss and Hyde's Add., lot 2 in block 1 sold for $650.

I know of no sales of unplatted lands out there; people who own those lots are not offering them for sale. Between Fort Brady and Algonquin are vacant lands in tracts of 20 and 40 acres—a garden community. They are all holding on, same as I am.

In the country, I valued rural lands at $25 an acre for the land, including all stations except the Soo. I made no distinction between station and country right of way; I lumped it. Some you would get for nothing, as it belongs to the Government, withdrawn for forest reserve; excluding that, some of the rest they would get at a very low price; some would be given by companies who want a road through. If you got below $25 an acre, you generally got it for nothing. When the railroad cuts across a farmer's 40 acres, he will sell the 40 acres nearly as cheap as the right of way, for he doesn't want his farm cut in two.

223 That, and the work of negotiating with owners, is the reason I said it would cost from two to three and sometimes five times the cost of the land to get it. There are 12 acres (12.12) to

the mile in a 100-foot right of way, and sometimes you spend a couple of hundred dollars to get it; that is my experience.

On December 31, 1913.

STRADLEY recalled by plaintiff.

Direct examination.

By Mr. Eldredge:

In my judgment, the value of the tract of land owned by the Sault Ste. Marie Union Depot Co. is $198,000, which is more than I valued the same property at in previous testimony. When I testified before, I made a conservative estimate, without great care about going into the thing very thoroughly, but I stated at that time that it was way below what I considered its value, and this time I made a more careful study of it, and, it being divided up into different tracts, I had to get at it on a different basis of valuation. I was asked to estimate the value of these different tracts separately, and, in order to do so, I had to go into the subject more thoroughly, and I discovered I had made the values too low. The other time was simply by estimated front foot value; this time by actual square foot values. I considered actual sales of property adjacent.

I valued the 3.29 acre tract colored red at 55¢ a square foot. I arrived at that value by figuring actual prices paid for property adjacent. I paid $8,500 for a part of private land claim 7, with a frontage on Magazine St. of 95.6 feet and on Emaline St. of 172.26 feet, with a total of 14,349 square feet.

224 Lot 2 of block 3 of Wood's Add. and a part of private land claim 7, on the corner of Ridge and Magazine Sts., and lot 8 and the east 11 feet of lot 9 of block 3 of Wood's Add., containing altogether 9,666 square feet, was purchased at $17,000. Lots 26 to 33 of Johnson's Sub., 30,660 square feet, were sold at $16,000. Lot 7, block 3, Wood's Add., 4,896 square feet, was sold at $2,200; lot 5, block 3, Wood's Add., 4,800 square feet, at $2,000; east 77 feet of lot 7, block 2, Wood's Add., 3,850 square feet, $1,600.

The total square feet in the above tracts sold was 77,671 and the total purchase price $47,300. I deducted buildings and improvements, $6,000, a very liberal estimate, leaving $41,300, or 53.2 cents a square foot. That is for property not as valuable as union depot tract, and for that reason I have made it 55¢ straight per square foot; I don't think that quite enough. I applied this 55¢ to the 3.29 acres and to the .92 acre strip on Portage Ave.

I applied 53.2¢ per square foot to the tract, 1.91 acres on Complt.'s Ex. 3*a*, Riggs. That is what the property on which I based my values came to; if anything, it is more valuable. The purchases I referred to are all purchases made by or through me. The tract on the corner of Emaline and Magazine Sts. has some wooden shell buildings, not worth $1,000. I deducted $2,000 for the buildings on lots 5 and 7, block 6. There is a little store and a house on the

corner of Magazine and Ridge Sts., and a house on lot 2, for all of which I deducted $3,000. The most valuable building deducted was at the corner of Magazine and Ridge. The buildings are all rented for a total rent of a little over $600 a year, which hardly pays interest, taxes and insurance.

225 The 3.15 acres owned by the Soo Depot Co. I valued at 37.5¢ per square foot, arrived at by using these figures and others and striking a mean between the two. That is below what it ought to be, I think. I took some valuations in Scranton and Robertson's Add. into consideration. I just tried to strike a mean between that and the other property. I think the value ought to be a little higher, but I put it at 37.5¢, as that was back further.

My value for the 1.91 acres is $44,257, and for the 3.15 acres, $51,455. I don't think you could buy those properties at the prices if it was in private ownership. You could perhaps buy pieces of it for less, but for some you would have to pay a good deal more, so the aggregate would be above the prices I give.

The triangle, 75 by 208 feet, Portage and Meridian, owned by plaintiff, I have valued at 25¢ a square foot, $3,920, which is its present fair market value. I would have put it at 37.5¢, but there is a break between it and the other tract on Portage Ave.; two lots out there. I took into consideration that it is in triangular shape and not as valuable as if square.

I know the tract belonging to plaintiff, 204 feet on Portage Ave., 850 feet on Meridian St. and 410 feet on Spruce St., and have valued the 3.1 acres in railroad use, No. 3, marked green on the map. I valued that at 12.5¢ a square foot, $16,879.50.

The .12 acre (item 4, Complt.'s Ex. 1*b*. Riggs) and the .18 acre (part of item 9) tracts I also valued at 12.5¢ per square foot, $653 and $980. The rest of item 4 is .23 acre, and the rest of 9 is

226 .37 acre. If these tracts (on 3, 4 and 9, within black lines) were together, I would make the value a little higher. The basis of value that I figured from was 14.17¢ per square foot, being the sale price immediately adjacent. I took as a basis sales of lots 1 and 2, block 2 of Scranton and Robertson's Add., 7,392 square feet, at $700, lot 25 of block 2, 3,748.5 square feet, $357; lots 221 to 224, 10,794 square feet, $2,060, lot 36 of block 3, 2,698.5 square feet, at $400, and lot 8, block 3, 2,698.5 square feet, $357. The average price of the above sales was 14.17¢ per square feet. That property is adjacent to this, and of equal value. The sales were two each, in 1910, 1912 and 1913. These were actual transactions.

I value the land in parcel 5 of Complt.'s Ex. 1*b*, Riggs, Chippewa County, at 6¢ per square foot, total $16,988. Item 10 I valued at 6¢ a square foot, a total of $21,693. In my judgment, this value was less than other property immediately joining has been selling for. I based my price on actual sales of property in Shafer's Add., and I took into account the prices of lots in Reidy's Add. The price of lots sold in Shafer's Add. amounted to 7.44¢ a square foot. Item 10 is as good property and would sell as quickly at the same price. A street car line runs through it, and it fronts on Meridian St.

I value item 6 at 5¢ a square foot, $53,012.50. In my judgment,

the value of that tract at present is the amount stated. If anything, my prices are all a little low. I figure the 2.5 acres at $5,445, the 16.82 acres at $36,633.95, and the 5.02 acres, corrected to 4.77 acres, at $10,933.55. I did not figure the 5.23 acre tract, but would put the same value on it. I got my basis from sales of lots in South Shore Add. These were actual sales, and averaged 5.13¢ a square
227 foot. There were three lots sold in South Shore Add. and three in Chandler's 3rd Add., all separate, in 1910, 1911, 1912 and 1913.

I value parcel 7, Complt.'s Ex. 1*b*, at 4¢ a square foot, 15.06 acres. $26,239.76, which is in my judgment its fair market value at present. This price also covers the wye in item 13. I arrived at this value from actual sales of adjacent land, three in Chandler's Third Add. and two in Foss and Hyde's Add. There were other sales at the same prices. On the other addition referred to, there were sales of other lots at the same figures.

I value item 8 at 4.25¢ a square foot, 9.57 acres, $17,716.93. That is a little higher than the tract east, because of the settlement at Algonquin. It has the tannery and the mills, and is quite a little town. I base my price on four sales of lots in Scranton's and Foss and Hyde's Additions, in 1908, 1910 and 1912, averaging to 4.94¢ a square foot.

All these valuations are higher than those I made of the same property on an acreage basis. I figured it out more nearly to its actual market value, and studied it a little more. If the railroad were removed, I don't know if the land could be sold right away; that would be a pretty hard proposition, but you could not buy it now for the figures I have put on it. You can't sell property until somebody wants it. I think that property, if platted and well advertised, could be sold at auction at those prices, pretty near, pretty soon, the way things are coming. I think the prices represent the fair market value of the property at the present time. I have not considered railroads at all; just the values of adjacent property, actual sales for use for buildings, residences, and other things, by people who bought to improve.

228 I know the value of the right of way of plaintiff from the joint yards at the Soo to Brimley. It runs right off from the high price land into unimproved land. It would average $200 an acre for 2½ miles ,to the city limits. There is platted land on both sides of it. On one side is Algonquin Sub., selling, per lot, at something about the prices given here; farther out in Hall's Add., and after that undeveloped land. There are no sales to go by. The land all along the railroad there is held in large tracts. The power company bought about 600 acres and is negotiating for more. It is right along the railroad, running out practically to the city limits. The river is close by. I own land outside the city limits which I would not sell for $200 an acre; it is not in the market. In all my valuations, I valued the naked land, without improvements.

The value of plaintiff's right of way from the Soo limits to Brimley, exclusive of timber and improvements, is at least $15 an acre. At Brimley, there is quite a town, and basing the value estimated

from actual sales I should say the land is worth $100 an acre through Brimley and, say, one-half mile on each side. A lot 50 by 114 sold for $100; less than an acre on the river sold for $400; .8 acre sold for $135, close to railroad, nearly ¼ mile west of station; about one-third of an acre sold for $125; two acres south of the village, not on the railroad, but over ¼ mile west of station, part of N. E./N. E. 8-46-2, sold for $209; 1.25 acres, a little south and east, sold for $150. These were all vacant lands. About .17 acre in section 8 sold for $157.37, and .4 of an acre in S. E./S. E. 5-47-2 sold for $125. Brimley is quite a nice little town. Five or six hundred people live in and around there.

229 STRADLEY.

Cross-examination.

By Mr. Wykes:

Item 1, Complt.'s Ex. 1*b*, was acquired by the Union Depot Co. before 1904. No comparison can be made with the prices now and the prices they paid, as the move was on the part of citizens and business men, who, to have the depot moved from Spruce St. and the freight depot further down, so it would be more convenient to the city, undertook to furnish a large percentage of the land. They formed a pool, and got special prices from some land owners. Some of the land was donated, and the railroad company paid the balance. My recollection is that the railroad company paid about $50,000. I don't know just how much the citizens paid; I know they paid sums all the way from $100 to $1,500. The property is worth considerably more today than it was then. Values have advanced since then; at that time I don't think you could have bought it, without that arrangement, at the price I have fixed on it.

The sales on the corners of Emaline and Magazine Sts. and Ridge and Magazine Sts., and lot 8 and a part of lot 9 and lot 2 of block 3 and lot 7 were to myself. Lot 5 was to A. J. Clergue; lot 7, block 2, was to F. W. Clark; lots 26 to 33 of Johnson's Sub. to my wife. There have been other sales in block 3, but not recently. I have been trying to buy a little piece in block 3, 52.2 by 68.8 by 172.26, 10,451 square feet, and their price is $10,000. There is an old house there, not rented. I haven't cared to buy it at that price.

I have been offered the balance of lot 9, block 3, for $2,500. It has an old building that has been burned out; not much good. None of the buildings in this block, except one, are worth much. They are cheap—no cellars, basements or foundations. I am buy-
230 ing the property at present for myself and others. I thought it a good buy. I have been picking it up for the last ten years, as I saw a chance. I haven't tried to force the purchases, but have bought just as cheap as I could for cash. There is no present arrangement between me and the railroad company that they shall take this property. I never had any talk with any person connected with this railroad in reference to its purchase. I had in mind, in

buying, that in time to come the new railroad that the Grand Trunk is thinking about will come in and take this site.

There are no other sales in Johnson's Add. within 10 years of lots fronting on Emaline or Ridge Sts. I didn't look up to see if there were sales in blocks 4, 5, 6 or 7, and in Johnson's Add. I didn't go into the second block south of the railroad. I took no sales south of Ridge St. The lots in Johnson's Add. belong to the same people of whom I bought lots 26 to 33. I took sales in both blocks 2 and 3 of Scranton and Robertson's Add. I figured nothing in block 1, as the Standard Oil Co. is in block 1, next to the railroad. There was some deal to get them located by the people who owned these blocks, thinking they would make a market for the balance of their property and get a switch in there. I do not know when the Standard Oil bought that property and located there. It was since the depot grounds were obtained. Private land claim 4 has never been platted or subdivided. I do not know the price on that; it would not be as valuable as the lots to which I have been testifying.

Blocks 2 and 3 of Scranton and Robertson's Add. were all vacant lots. There are probably four or five houses now along Spruce St. They are of a character not to increase the value of the property, and up above there they have had for some time a wood yard or
231 place to unload lime, brick and building material. Those two blocks are mostly vacant. There are a few houses there, but what they are I don't know. There have been other sales, within — years, than those given, but at the same prices I gave. I took the lowest and the high prices; I took all that were different. I do not know how many there were at the highest price or at the lowest. Several lots were sold at $357 cash. I did not go back of 1910. The subdivision has been made a good while—before the Spanish war.

The boom was in 1887 and 1888. They have had property up to boom prices right along, ever since, except where some fellow would get tired and let go. The taxes were levied on boom prices, and owners of outlying property would get tired and let go. The taxes on a ¼ interest I owned in S. W./N. E. 11-47-1 were over $28. This property is just west of Scranton's Add., the first land not platted south of the track. The city was organized from a village, and the limits fixed, in 1887. There has never been any real effort to reduce the size of the city.

There are a few lots in Reidy's Add. where taxes are delinquent, because they are non-resident owners and they put on a heavy sewer tax three or four years ago. I had no sales in Reidy's Add. I know what lots are held at by Reidy and others, and I have two or three lots there for sale for non-residents; they hold them at higher prices than I named here. I know of no sales at those prices.

Reidy's Shafer's and Eureka's Additions are pretty well built up. Forest Poole has been holding a vacant lot on Eureka St. for $450, and two other lots there have been held at the same price. An expansion sewer has gone in there. Prior to 1910, I sold a lot, 50 by
117 feet, in Eureka Add. for $400. There was a sale in
232 South Shore Add. in 1910, to Julia Vogt, who borrowed $500 on two lots, 40 by 100 feet each; I think she paid a little

more than that for the lots. There was another sale there last June, of a lot 40 by 100 feet, for $250. There are quite a number of houses on that plat.

I have no other sales there, back to 1910. I have a lot of other lots for sale there for $300, and have had offers of $250 for two lots near these that Miss Vogt bought this summer. Her lots are 9 and 10, block 2 of South Shore Add., and these other two lots were either 13 and 14 or 14 and 15 of block 2, not on the car line. My client declined the $250, and said he wouldn't sell for less than $300 apiece. The unplatted parcel west and south of South Shore Add. belongs to Judge Steere; that is the east half of N. E. Mr. Chandler owns the east half of N. W. lying south of the railroad. I do not know what either Chandler or Steere hold their descriptions at. Opposite their land, I figured the railroad land at 5¢ a square foot, or $2,178 an acre.

The Soo is well supplied with platted lands at present. During the boom they platted way out in the country; one addition of 80 acres was six miles out. There are houses on Chandler's Third Add., but I don't know how many. The last sales I have there were in 1912, lots 7, block 1, 40 by 120 feet, $225, and 2, block 2, 40 by 125 feet, $200. I think there were others, but all the same. Chandler still owns some lots there. He might reduce the price on the entire bunch of lots. He is not pushing the sales.

There isn't anything in the market outside of the "Y." I have no sales in Peninsular Land Co. Sub. It belongs to the Northwestern Leather Co., and built over by them for their employees; it has a schoolhouse, church and mills. The city limits are about 8
233 miles apart, east and west, and 3 miles north and south. The census was 13,600 people; we claim between 15,000 and 20,000, as the past three years we have been growing.

A good deal of the land south of that shown on Complt.'s Ex. 3*a*, Riggs, is farm land. A lot of it is platted. It is about 1¾ miles from Chandler's Sub. to the south city limits. I have some wild farm land up there that I refused $100 an acre for. It is high ground and worth that as farming land. I think that forty which I spoke of is assessed at $800. I have some, right across, inside the city limits, exactly the same kind of land, assessed at $1,300 a forty, the same as they assessed the best farms with improvements. There is only one farm sale that I recollect, 40 acres four miles out, for $3,200. The land was good, cleared, and under cultivation, and all it had on it was an old hay shed, a well, and a little old house.

Description 15, Complt.'s Ex. 1*b*, Riggs, runs right through land purchased by the power company, which has 600 acres there. It was bought by Clergue several years ago. I have no sales opposite this description. The land there is all wild. There are farms back up on the hill, miles away. Charles S. Beedle sold to the Dupont Powder Co. .97 acres for a powder house out of the west half of N. E./S. E. 10-47-1, about ¼ of a mile from the railroad, price $250. It is northwest of the track, adjoining the new park and fair grounds.

A parcel of 90 acres, the S. E./N. W. and east half of S. W. 22-47-1, except the Soo Line right of way, sold for $3,100. One corner runs

down to the railroad. It is wild land, located, where it begins to go from the railroad, up on the bluff, about ¼ of a mile from the city limits. N. E./S. E. 22-47-1 (39 acres), about 1¼ miles
234 from the South Shore, sold for $1,200; it is about ½ a mile from the city limits and wild land. The north half of S. W./S. E. 22-47-1, about 1¾ miles from the South Shore and about ½ mile from the Soo Line, sold for $500. The other half of the same forty sold for the same price. All that land is rough and wild, near the edge of the bluff. The west half of S. W. 25-47-1 sold for $4,500. It has a pretty fair barn on it and a small house. It is about 3½ miles from the South Shore and two from the Soo Line. It was cleared land. As far as the value for farming purposes is concerned, the land on the bluff is no better than that on the bottom, which is good farming land. There are no farms along this 2½ miles, as it has been held in large holdings ever since the boom.

I have given all the sales opposite the 2¼ miles, within the 2½ mile limit. I do not know of any lands adjacent to the 2½ miles of item 15 that are for sale, nor what was paid for them, nor what they hold them at. I would not give the sale to the Dupont Co. very much consideration. I simply made an estimate from the other lands that we have been valuing at the end of the city. There are sales in Hall's Add., on the N. E./S. W. 11-47-1, that I didn't take, but I used them as sort of a basis. They are $75 and $100 a piece on tax titles. It was platted at the time of the boom, and all was sold for taxes. Quite a number of the lots have been sold at those prices by owners under tax titles. Hall's Add. is about 1¼ miles inside the west city limits, about two miles from the city limits along the South Shore. That is the last plat along the line of the road. Then it runs into the water power land until you get to the city limits.

The land from the city limits to Brimley adjacent to the track is practically wild. I have not had any sales of improved farm land anywhere in there. I do not know what improved farm lands
235 sell for in that part of the county, nor what they are held for out that way. I don't know of any being offered for sale. The S. W./S. E. 28-47-1 was sold at $200. It is 40 acres, about a mile from the South Shore and close to the Soo Line. The sale was from a sister to a brother. The country from the city limits to Brimley for a mile on each side of the South Shore is nearly all wild land. Little corners of farms touch it. I honestly think it is worth $25 an acre straight through. I say it is not less than $15. I do not know whether this particular description was cleared or improved or not.

There was an old contract of the D. M. & M. R. R. Co., under which S. E./S. E. 29 was sold for $260. The final payment was made in 1911. It was not cleared when bought, but is now partly cleared. It is now worth $40 or $50 an acre. It is within a few hundred feet of the railroad. My recollection is that $400 was borrowed on the forty acres, which would indicate a value of about $50.

In these transactions in lands which were outlying, my information as to price is usually taken from records. I wouldn't say that that was an absolutely accurate way of getting at it, because they

put considerations in sometimes high and sometimes low. Sometimes they want to cover the consideration to keep from having taxes boosted. Most of them are getting to do that. When they want to sell, they might inflate it, but not often. It is not always the fact that when they want to keep away from the tax they put in a dollar and other considerations. Some of those people insist on having a consideration of some kind put in.

With reference to those sales to which I have testified, I know the character of the land and its value from the general values of the land in that neighborhood aside from the consideration mentioned
236 in the deed. The considerations given in deeds are very low, way below what the value of the land is, as a rule. The fact is, we have no farmers up there. Although they have lots of farms, they are generally woodsmen. Their ideas of the value of farming lands are not scientific at all. These are not the people who make the demand for the farming territory at the present time. They are coming in from the outside and buying fast, but not putting their papers on record. In my office, last week, five contract sales were made of lands out in the county, none along the line of the railroad. They were in different directions and at prices three or four times those along the railroad.

The land for a mile through Brimley is cleared, and is good farm land. $100 an acre is quite a high price for the general territory along the railroad. At Brimley, it is right at a market. I would fix it at $60 for the average. No, I don't think I would; you can't clear the land and get them cleared for that, and buy them at the prices they have to pay now. Lands will run from $20 to $50 an acre to clear. It depends, of course, on the character of the timber that was on them; some of it will clear easy and some of it hard. You have to take that into consideration, and when you get it cleared it is worth more than the cost of clearing and land, I think, because it will produce, to pay interest on that. The sales I have given at Brimley were right around the settlement.

STRADLEY.

Redirect examination.

By Mr. Eldredge:

With reference to the 2½ miles of property within the city limits, covered by item 15, my valuation is based on the uses to which that property may be put, as well as upon prices for which portions
237 have been sold. I did not take into account, as affecting my value, the holding of the power company. I took it just as it lay there, other lands, the whole tract in there. I mentioned that as an incident that it was owned by that company. That property lies along the river and railroad. The fact that it is suitable land for sites which will have a water front is one element that might be considered, but I left that out. In the portion of the right of way between city limits and Brimley, I valued the land without timber or improvements.

238 On July 17, 1912.

HENRY HOFFMAN, a witness called by Plaintiff.

Direct examination.

By Mr. Eldredge:

I am a lawyer. I have lived in St. Ignace about 30 years; dealt some in lands in St. Ignace and Mackinaw Co.; acted as agent for Northern Michigan Railroad in acquiring property in St. Ignace. I own property and know value of lands there.

(Complt.'s Ex. 4, Riggs, shown witness.) I recognize property on map, described in Complt.'s Ex. 1, Riggs, as Humphrey lot, 136 x 1,650 feet, with riparian rights on 136 feet; present value is about $200 per acre, judging from other sales I have made; there is good water for dock purposes there.

Value of property described in Complt.'s Ex. 1, as right of way and dock property to Martel Furnance, 6,450 feet, 9.78 acres, independent of improvement by railway company, is $350 per acre.

I know plaintiff's dock property at St. Ignace; should judge there was 2,400 feet harbor frontage including land occupied by docks; I value it at $15 to $20 a foot—say $20 a foot.

The Plaintiff offered $4,000 for 160 feet of water front just northwest of its docks, but owner asked $16,000, so sale was not made. The Northern Michigan Co. paid $8,000 for about 950 feet of water front near Hazeltine St., extended, with some other property. The same company had arranged to buy the Jamison Lumber Co. property, which includes about 300 feet water front, for $10,000, but deal fell through. These properties are on shallow water, while plain-

239 tiffs property is on deep water and requires no expense for long docks or dredging.

Adjoining railroad, where it enters St. Ignace on northwest, is a bluff 100 to 150 feet high on one side and lake on the other; in city, bluff on one side and business streets on other. I do not know of any other entrance for railroad from that direction into city.

I know right of way from southeastern end of yards near roundhouse to water front, 50 to 75 feet in width. The value for any other purpose, if railroad were not there, is about $5 per lineal foot; cost of acquiring it would be $10 to $12 a lineal foot for the bare land. If it was not for the right of way there, that property would be used for business lots and would be worth $40 a front foot. All the property I have previously named, except Humphrey lot and the hotel lot, is devoted to railroad purposes.

HOFFMAN.

Cross-examination.

By Mr. Wykes:

First train passed over the line in December, 1881. Population of St. Ignace today is about 2,500; it was not over 700 or 800 then. As

to value of land along right of way, some lands are very much lower now than then; lands in the country are very much higher now than at that time. Country was just developing; before introduction of railroad it was unbroken wilderness from St. Ignace to Marquette. Allenville and Moran were unbroken forest then. St. Ignace then wasn't a village at all, settlement did not extend back from State St., except in a very few instances. The railroad right of way ran along where there were very few buildings. I think it would have cost fully as much, if not more, to acquire it then as it would
240 now, excepting damages now resulting from removal of buildings, etc.

As to land from old ship dock west to gravel pit (described in direct examination as right of way from southeastern end of yards to water front), at extreme easterly end, next to State St., the right of way leaves a gore between track and street 50 to 80 feet wide, which on account of its size and shape, is absolutely valueless for any purpose whatever. If it were not for this right of way, it could be used for business purposes, and would then be worth about $40 a foot, which amount entered into my average of $5 a foot on the whole strip. I took into consideration value given it by fact that the man owning an irregular piece next to it would probably purchase it to fill out his piece. Some portions of this right of way could be disposed of at very much more than $5 per foot to fill out lots adjacent to right of way, but average would be $5 per lineal foot.

Dock property of railroad, as above mentioned, 4,485 feet by the map, has only one railroad track on it. I don't think there are any railroad buildings on piece south of track; this is not shown on map.

It may be necessary, in order to construct a long dock on a curved shore, to have 3 or 4 times as much water frontage as that occupied by the dock, in order to protect dock owners' rights at outer extremity of dock; if you didn't, you would cross somebody else's land. This question has come up several times here.

I base my judgment as to value of these lands on what we had to pay for the land and other lands in locality; values are my
241 judgment. Don't know of any place in St. Ignace as well adapted to dock purposes as plaintiff's water front; farther down you are exposed to ice floes, and farther northwest two things combine to make it far less valuable, (1) you have to go so far out to get deep water, and (2) you do not have the sea room in this bay for the big car ferries to turn around. For that reason, I couldn't say how much more valuable this property is for the purpose than that purchased by the Northern Michigan R. R. Co.

The part of St. Ignace lying between the bluff and the water front is about 400 feet at the narrowest place, the right of way there being 20 or 25 feet above water level.

Piece of land marked "e" in lead pencil on map was acquired by Northern Michigan Railroad under same contract as piece marked "e" and the water front. Paid $8,000 for water front and lot "e" in the purchase, in order to get the water front; lot "e" (for which

$4,000 was paid) is a little bit more than "c" and had a building on it, worth about $1,200, renting for $7 a month.

I am D. S. S. & A. local attorney.

HOFFMAN.

Redirect examination.

By Mr. Eldredge:

I believe that part of water front, approximately 160 feet on State St., in blue color on map, between red lines, is essential to the railroad for the use of the docks which it actually has.

I have had experience in acquiring right of way for railroads; was engaged by Northern Michigan Railroad Co. to acquire its
242 right of way from St. Ignace to the Soo; I acquired about 2/3 of it. In some instances, I presume it cost at least 5 times what we had to pay for the land in order to get the right of way; this cost was made up in traveling expenses, attorney's fees, etc., and some of the land was covered with many years' taxes. We had no condemnation proceedings. I should say that 3 times the value of the land would be a conservative estimate of the cost.

On January 3, 1914.

HENRY HOFFMAN, Recalled by Plaintiff.

Direct examination.

By Mr. Eldredge:

I testified before that the average value of the water front at St. Ignace is about $20 a lineal foot, measured on the water's edge. I am still of that opinion. That portion of the water front in item 5, Mackinaw County, of Complt.'s Ex. 4*a*, Riggs, is the most valuable in St. Ignace, as it is not necessary to go very far out to get deep water, and then it is protected. Further east than the line between claims 9 and 10, the sea has a greater force on the situation, and further west, into east Moran Bay, the car ferries don't have sea room to swing around.

When I say $20 a lineal foot on the water's edge, I estimate in that frontage, and did before, all the land between there and State St. In my judgment, all that water front is in use. The situation there is such that it would be unwise for the railroad to part with any of it; it is necessary for the proper protection and use of the wharves now in the lake. This is my opinion, as I don't suppose it is possible for any person to decide without a court decree what is and what is not necessary for the protection of the ferry dock. It does
243 not require a court decree to determine that it requires that room for the ferry to back around in. The decree of court comes in determining the rights of adjoining land owners as fixed by the angle from the shore line to the thread of the bay. In my opinion, it would be unsafe to dispose of any of the land. It would

also require a court decree to determine what effect a structure built out there would have on the lumber and slip docks.

If the part of item 6 east of the red line and just west of the base of the slip dock was not owned by the company, others might build a wharf into the lake, which would make the easterly side of the lumber dock practically valueless for company uses. A wharf built midway between the lumber and slip docks and parallel with the former, might not materially interfere with its proper use, (boats could go in and back out), but what the rights of the parties would be between the lumber dock and the slip, as to extend the structure out into the water, I can't tell. Item 6, the water front, indicated in yellow, is only used in going out on this wharf—the lumber dock.

In item 3, the parcel of 1.36 acres, standing alone, would be of little value, but it is valuable to the city or to parties owning the land on both sides, Church to State Sts., to make a street, midway between the two streets, making a market for the land. For that purpose, in my opinion, it is worth $700 an acre. The triangle, .63 acres, would constitute just about a building lot; $100 is a fair value.

The .72 acre, 196 ft. on State St., is worth at least $40 a front foot on State St. for commercial purposes as there is no vacant street frontage on the south side of State St. in the market today be-
244 tween the wharves and Goodrow Alley. The narrow right of way commencing on the west side of State St. diagonally from the dock slip to the north line of private claim 18 is 3,170 ft., and worth $5 per lineal foot. In arriving at this estimate, I consider the uses that may be made of portions of it, and sales made of nearby property.

The triangle which it crosses, 150 ft. on State St., is worth $40 a foot front on State — for business purposes. A man who owns the land in the rear would be willing to pay that in order to make his land available for any purpose or the man who owns the triangular piece would be willing to purchase the land in the rear to make his piece avaliable for use. The triangular piece standing alone is not worth $40 a foot. I assumed that the other land could be acquired when I fixed my price. Some portions of this right of way are not worth $5 a foot. The piece immediately west of this, 160 ft., is, in my opinion, worth $10 per lineal foot for the use that may be made by selling to those who own lots between it and State St., and extending their lots.

There have not been many sales of real estate in St. Ignace. Lots 7 and 8, each 40 x 90, sold this past summer for $400 for the two, and the piece of land in the rear of lot six sold recently for $125, or 6¢ a square foot, and a little gore back of lots 4 and 5, 1,200 square feet, sold for $50. Another sale of a piece 50 x 100, at the corner of State St., and the alley at the foot of Portage St., was made for $800. A lot farther west on State St. in the same block, 25 x 90, sold for $400. The railroad right of way of 66 feet wide at $5 per lineal foot would be a little under 8¢ a square foot. The position the right of way taxes precludes extension of Church St. to Trucky St., and I have no
245 doubt that the right of way for 50 feet east of Trucky would be sold to the City for much more than $5 a lineal foot, for street extension.

In making my figures of $5 a lineal foot, I figured the first 150 feet from the easterly end at $40, the next 150 feet at $10, the next 424 feet at $6, the next 915 feet at $2, the next 723 feet at $2, and the next 800 feet at $2, making a total valuation, without the square piece of land, $15,860. The 915 feet is a strip of land between Trucky Street and the alley. The uses which could be made of that would be for a street between those two points, on both sides of which lots could be laid out.

(Stipulated Item 8 is worth $100 per acre, and each acre of the same value.)

I have had no experience in determining the shore area it takes to afford proper space for use of a dock. I have not had any experience as to what the man who runs the boat would find necessary. As to that particular point, I am simply applying what I regard common sense. The usual way in which the car ferry is operated is: As it backs out of the slip, it swings around to the south and gets its bearings, comes around to the north and circles around to the east, and gets on its course. I would not say the railroad would invest in very much of the shore line to permit it to do that. While undoubtedly the ferry could be operated in a way which would not require so much of a protection from structures built out from the easterly end of this railroad water front, yet it is a convenience to do that, and in order to protect its rights to enable it to do that it would be to the best
246 interests of the road to own the water front. I would not think it reasonable for the railroad to maintain a large investment in shore land simply to permit the boat to turn around. I only mention that is one thing why it is necessary and perhaps of advantage to own that water front. Another necessary thing is to protect the proper use of the big dock south of the slip dock. In my opinion it would be unwise to part with any of that water front.

The value I place on the narrow right of way in St. Ignace assumes its use in connection with the adjoining property, sales to adjoining owners, and the uses that may be made of it for streets. The land ownerships adjacent to this right of way on both sides are pretty well cut up; it is held in many different irregular tracts. Some of this strip would sell readily and quickly for more than the figures I give. It would take some time to get your abstracts and to divide it among the people and make all other arrangements. I haven't deducted that from my price. This strip couldn't be sold and turned over to private owners all at once. I have never had charge of the adjustment of anything comparable with this, nor heard of anyone else doing it. My value contemplates that this land may be used for other purposes than railroad right of way, for the extension of lots for streets, and for building lots. Some of it without being united with the adjacent property would not be worth much except for a railroad or for a street. In the strip as it is at the present it would not be worth much unless it could be used for railroad purposes.

247 On July 18, 1912.

EDGAR H. HOTCHKISS, a witness called by plaintiff.

Direct examination.

By Mr. Eldredge:

I have lived in St. Ignace since 1890. I am cashier of First National Bank; have dealt some in lands there and know value of same. I know the Humphrey lot, 136 x 1,650 feet, and should say it is worth from $150 to $200 per acre; know right of way to Martel Furnace, about 6450 feet in length, 9.78 acres, and value it at $300 to $350 an acre without improvements.

I know dock property owned by Plaintiff, 2,400 feet harbor frontage, and value it at $20 to $25 a foot frontage. I have special knowledge of value, because we sold property of Mackinaw Land Co. there for that purpose to Northern Michigan Railroad Co. for $8,000; I made the sales. That was very much less valuable for dock purposes than plaintiff's dock property. In my opinion, this South Shore property is the most valuable water front in St. Ignace.

I know plaintiff's right of way from its yard, near round house, to the lake front, about 4,200 feet; it runs to the shore, excluding the Martel Furnace line. I should consider $5 or $6 a foot a fair price for it. It would cost $10 a foot to acquire it by purchase or condemnation if railroad was not there.

I know piece of land colored green on Complt.'s Ex. 4, surrounded by red lines, upon which yard, engine house and gravel pit is located; in my judgment, its value is about $400 or $500 an acre. This judgment is based upon my knowledge of sale of a piece of land marked "*e*" on plat, by Mr. Johnson of the Mackinaw Land
248 Co., for $4,000.

HOTCHKISS.

Cross-examination.

By Mr. Wykes:

In fixing an average value of $5 or $6 a foot for right of way running 4,200 feet west from the old slip dock, I took into account that some of these parcels were cut up, and that the owners of some of adjoining property would give more than it is actually worth to get it. The person who owns the back part of a parcel would give more than the front part of it is worth to unite parcel and be on the street. If it were a single parcel of that acreage, I wouldn't put the same price on it; it would depend somewhat upon where it was located. In getting at my valuations, I placed different values upon different parts of it, and then averaged it up; for instance, the lot just north of Truckey St., with a sidetrack running through it off to the coal dock, is a valuable lot, while the lowest values are up north of Maloney St.

In arriving at my figures in the first place, before I knew anything about what this was for, I was asked what I would consider that worth per foot, and I have my estimate. That estimate was based upon my judgment; my judgment was based upon my knowledge of what property in general is held at in St. Ignace, and what in my judgment people would regard the property worth for this purpose to go through it, not putting valuations on the different parcels but just in a general way. In my judgment, if St. Ignace were without this railroad, it would be a dead town.

249 HOTCHKISS.

Redirect examination.

By Mr. Eldredge:

In arriving at my final judgment of $5 a foot, I estimated what that property would bring if the railroad were taken away from there. My judgment is that the property at the west end of this strip would be slower of sale and of less value than the east end, and I averaged the whole distance at $5 per lineal foot.

HOTCHKISS.

Recross-examination.

By Mr. Wykes:

The values of $40 a foot would apply to less than half of the description. I arrived at this (my judgment of value) by estimating the whole tract; I didn't take a piece of paper and put each lot down.

250 On July 18, 1912.

ROSCOE C. YOUNG, a witness called by plaintiff.

Direct examination.

By Mr. Butler:

My age is 48; I live at Marquette. I am Chief Engineer of the Lake Superior & Ishpeming, and Munising, Marquette & Southeastern Railway Companies, which have headquarters at Marquette. These companies haul ore from the iron district.

I began working at civil engineering in June, 1883, as a rodman. I worked from 1883 to 1893, except one year, on the Peninsula Division of C. & N. W., headquarters at Escanaba. From 1893 to 1894, I located for the C. & N. W. in Wisconsin. During 1894, I had charge of a water works plant in Illinois. From 1895 to 1900, I was Chief Engineer, and Chief Engineer and Superintendent, of the Munising Railway, now a part of this system.

During 1900. I worked with the so-called Cooley appraisal. appraising the railroads of Michigan. I had the South Shore, Mar-

quette to the Soo and St. Ignace, the Munising, the Manistique & Lake Superior, and the Manistique Railways, part of the Pere Marquette, from Port Huron north and west, and the Michigan Central, Saginaw to Kalamazoo, via Jackson; also special work at other places. After that appraisal, I worked for the Copper Range, on special work, for two or three months. From the spring of 1901 to 1903, I was Chief Engineer of the Des Moines, Iowa Falls & Northern, in Iowa; and located and built 76 miles. During the next year, I was locating engineer of the Rock Island System, and located 200 miles through Illinois. I came to this road, here in Marquette, in June, 1904, and I have been here since.

Since here, I have located and acquired right of way for
251 and built some railroad; we build some every year. The first year, we built ten miles at our east branch, and the next year, I built 25 miles—our Lake Independence extension. The next year, I built from Little Lake west and the mining tracks around Princeton. Since that time, we built our north main line through Negaunee, and I had charge of the construction of the South Shore change through Negaunee, where they built the new track. Then we extended our line from Ishpeming west to the Barnes mine, about seven and a half miles, in 1910 and 1911. Except about five years, I have been railroading in the Upper Peninsula 29 years.

When I took part in making the examination, for the Cooley appraisal, of the lines of the South Shore Co. east of Marquette, I went over the road on a handcar. I made and reported estimates of the quantities of grading, and classification as between earth and loose rock and solid rock.

Two weeks ago, I went over the lines of D. S. S. & A. west of Marquette, as far as Iron River, Wis., going over all main track in Michigan west of Marquette. I had with me the condensed profile. It gets to be a habit to form opinions as to the yardage in the roads; that is a part of the engineering profession. We are required, in locating, to make approximate estimates of yardage per mile; we get familiar, by looking at a piece of road and profile, with arriving at the approximate quantities. In calculating the yardage to be moved in a railroad to be constructed, the profile is used. It is customary to add percentages and other things deemed necessary to bring the yardage up to what we think it actually will be to include work outside of that actually shown on profile.

252 It is customary to add 10% to cover shrinkage and settlement; it is also customary to add a percentage, and a percentage must be added to cover grading for crossings, channels, surface ditches, drains, roads to barrow pits, etc. An engineer usually forms an established custom, though he departs from it if there is anything extraordinary. Usually, I add 10% for these things, and if there is a lot of swampy ground, or something like that, we add more; this percentage is in addition to that for shinkage and settlement.

On D. S. S. & A., east of Marquette, I would add 10% for shrinkage and 10% for highway crossings and extras, except through the long swamp, Ta-qua-me-non, where it would be necessary to add at least 50%; my recollection is there is 30 miles of it. My experience

justifies 10% for shrinkage and settlement; it is only a safe figure to bring the road to completion at the end of contract period. Even that would not cover the road after operation for a number of years.

Ballasting in swampy places disappears. On Munising railway north of Shingleton, I put three train loads of sand ballast on a similar dump to the one spoken of and two years later hauled two more train loads on to the same embankment; the sand had settled into the embankment. The surface of the embankment on which the ballast rests sometimes settles and distorts out of shape, requiring more and more ballast, as time goes on, to keep the line in shape for operation.

American Railway Engineer and Maintenance of Way Associations' Report, pages 548 to 552 inclusive, for 1907, shows cross-section cut of an established roadway; it indicates a deformation of
253 the original roadway, and that there is 2 or 3 times as much ballast actually in roadway bank as indicated on surface. It is always the case, and more especially in soft roadway; clay roadway is not as liable to deformation as the muck banks I referred to on D. S. S. & A.

The illustration shows how it is necessary to keep restoring the ballast from time to time, and that it is impossible from examination or measurement of a bank to calculate accurately the yardage of grading and ballasting of an existing property. The presence of that amount of ballast is an advantage to the track; the track becomes firmer after the period of years shown. A railroad embankment well maintained appreciates; the reason is that when the road is built it settles and it is necessary to employ a larger number of section men to keep track in good operating shape, and the shoulders of an embankment wash down, and it is necessary to haul more material on for shoulders, until banks and cuts are grown over with vegetation, so they stay practically the same.

Growth of vegetation on slopes adds to value of the property; it gets in fair shape in 5 or 6 years; after 10 years it is practically permanent, after which it usually requires no more work. On our line, M. & S. E., Marquette to Lawson, 10 years old, I was obliged last year to widen all of the shoulders, to get in shape to hold ballast; on that track, though 10 years old, the cuts have not become sodded over like D. S. S. & A. Construction, or added maintenance, continues a number of years after the road is open to use; it is necessary to keep doing work on it a number of years, which is not usually considered in line of maintenance work.

For 1911 or 1912, in my opinion, fair unit price for grad-
254 ing to reconstruct lines of D. S. S. & A., taking everything into consideration, would be 30¢ for earth. You would have to pay contractors the price for that length of line.

For ties, as a whole, I always figure 55% condition as their limit. After the road gets to a renewal basis, the ties are usually 55%; they are still in 100% efficiency. If ties last 10 years, 10% must be substituted by new ties each year. When the old tie is taken out there is a new one to put in its place; you have them both on hand, which

is the reason it is 55% instead of 50%. You are using the old tie, but still have the new one which has been charged to the work.

Usually 3,000 ties per mile of main line are put in first class track; South Shore main line and mine tracks have 3,000. A cedar tie will last 12 to 15 years; hemlock or tamarack 6 to 8 years. We have been putting date nails in our ties for 12 years; have kept a record of every tie that has come out, and had that compiled, so we know how long they last. In 3 or 4 years we make a statement of averages; that is done so we know what ties to buy.

Last year we paid 38¢ for cedar ties along the track; it costs us 2¢ to load on cars, and we figure inspection at 1¢; I should say on the South Shore 3¢ a tie would be the minimum for freight charges, 2¢ for loading and unloading, and 1¢ for inspection; that would make 44¢.

It costs probably half a cent more apiece to load hemlock and tamarack ties, as they are heavier. 38¢ is the price we pay small jobbers, delivered alongside our tracks. Ties sold for more money last year by the larger shippers; we buy ties considerably cheaper to
255 take them from farmers and the like along the track. There are dealers along the Munising Railroad that we cannot buy ties of, as they get more for their ties in Chicago then we can afford to pay. It costs more to load ties picked up along the main track, as we must have the services of a tie train all the time. The hemlock, tamarack and black ash ties would be a half cent more for the extras and the tie charge is 30¢, making 36.5¢. For culls or number two ties, I paid, last year and this: cedar 22¢, and hemlock 18¢; loading and transportation, 6¢ extra. This is ties taken on regular inspection; taken out of regular inspection, we paid: cedar, 15¢ and hemlock 10¢. Material is getting scarcer and harder to get. The high prices of two years ago have not been reached since, but we do not get the low price we did 10 years ago; the tendency is upward.

I estimate track laying at $528 a mile. I am generally low; it generally costs a little more than I estimate. There are other contingencies and things which make it cost more. I think it usually costs 20% more than my estimate.

It is customary to add for engineering services in constructing a railroad. The recognized percentage varies somewhat; my experience is that 4% is about right, applied to the construction items, not including rolling stock.

It is necessary to allow interest during construction, the allowance depending on the time and rate; the time is an estimated factor. To reconstruct plaintiff's lines, including location and acquiring right of way, would take about 4 years; the location ought to be made in a year. The chances are, the right of way would not all be
256 acquired until construction was completed. I think a year for preliminary and three years for construction.

The bulk of right of way would usually be paid for before grading is commenced. The interest should be computed for half the time for construction—2 years. Our custom is one-half the period at the full rate; I think that about right. 5% is customary, and our calculations are based on 5%. The rate depends on the credit of the

owner. I am always instructed by the management what rate to figure.

Our company has good credit and strong associations. I think its credit the best. The Lake Shore & Ishpeming are now building an ore dock near Presque Isle. I estimated the interest at 6%. They told us that conditions are different, and the bond rate would be higher. It is now on the second year, and I have over-run almost 25% on it. My interest estimate was $36,614; on June 1st, we had spent $42,030. We won't begin partial operation until Aug. 1st, 1913. My experience is, if you get any earnings due to operation during construction, they hardly come up to cost of operations. Such operation is a nuisance; it interferes with construction, and makes it cost more. My opinion is there would be no net revenue during construction to be offset against interest.

While I think the road when built, Soo to Marquette, could be operated at a profit while the rest was being constructed, I don't think they would finish a piece of road like that; they would not get it done in three years if they did. They would have to start it all at the same time; if they started to build from here to the Soo, and did not start the other work, it would take more than that time to build it. Piecemeal construction would take more time and money.

257 In estimates of cost of railroad construction, it is customary to include, over and above all items of material and labor that can be specifically enumerated, a percentage for contingencies. So far as my experience goes, 10% is customary for all construction items until the ballasting is finished. I am not as familiar with rolling stock, and do not think the percentage as high. On 5 engines recently bought, the overhead cost, including freight, inspection, etc., was 3%.

My custom is to add to all the different items going to make up the estimate, usually, 10% for contingencies, and afterward I add another 10% for contingencies to the whole estimate; we always needed it before we got through. I always figure that if I come within 10%, one way or the other, I am near enough. I sometimes overrun 10% and sometimes underrun 10%, but have concluded that that is a fair method. If I understand correctly, Mr. Riggs' percentage for contingencies in Complt.'s Ex. 1, Riggs, page 292, includes a percentage for engineering.

I don't think the average of 7.9% high enough for contingencies. On some items, such as ties and track fastenings, 5% is allowed; I do not think the average is high enough. It ought to be 10% on both ties and track fastenings. I do not see anything else on page 292 but what looks all right. The right of way items might be a little low; it is hard to estimate. I have never been able to make an estimate on that.

The estimates and experience referred to in my testimony relate principally to work on the L. S. & I., M. & S. E. and Munising Railroads, about 160 miles of main track and 50% other track. The prices have been varying, usually advancing. I have had to do with acquiring right of way, involving acquisition through

258 rural, timber, second growth and agricultural lands, in northern Michigan and Iowa.

I am familiar with lands through which South Shore runs. I am able to give my opinion of relation of cost per acre of right of way lands as compared with value for other purposes in rural districts; eliminating mineral lands, the average relation is 3 to 1. You get extremes both ways; sometimes you pay about the actual land value, and again, somebody holds you up to more than 3 times the value. On a piece of land 25 miles northwest of Marquette, acquired 7 years ago, prices, aside from cost of procuring, ran $15 to $170 per acre, through practically the same kind of land. That land varied from sandy loam to heavy soil. The timber conditions were about the same as on South Shore, some second growth, virgin timber and rocky lands.

On recent trip over South Shore, I noted character of land in Gogebic, Ontonagon, Houghton and Baraga Counties. I have never been able to buy right of way at less than 3 times what I considered the fair value of the land.

In my opinion the multiplier to be applied to market value of land, Nestoria to State line, is at least 3. That applies generally, I think. People I have had to deal with objected strenuously to a railroad across their property. This would apply to all the lands of the company west of Marquette. I have a good deal of experience in getting right of way in Marquette County.

I do not think you would be able to buy any land without mineral reservation. The principal area containing deposits of iron is from

259 west boundary of Marquette County to near Eagle Mills, 8 miles west. Prospecting there to Marquette has never shown anything. In past few years we are not able to get right of way in Upper Peninsula without mineral reservations and removal clauses that read "by removal at railroad's expense if minerals are found under tracks." We have to accept that kind of grants. We cannot afford to pay for suspicion of mineral under right of way. The tracks of my company, the South Shore and the C. & N. W. are indicated on Complt.'s Ex. 8, Riggs.

I have recently procured right of way in territory embraced in this map, in section 5-47-26; this was for South Shore, where I had charge of construction. I procured three-quarters of a mile to a mile of the 2.6 miles right of way now used by South Shore. I acquired this right of way and built for plaintiff, as Cleveland Cliff Iron Co., which controls L. S. & I., owns mines each side of old South Shore main line. The South Shore had permanent right of maintenance contract on their old line, which could not be enjoyed consistently with the mining under the track and for some distance away. As they mine the ore, they hold up the surface temporarily; when they are through mining that part of the mine, they let the surface cave in. It would be too expensive to reconstruct the track afterwards, and you cannot tell when it is liable to cave.

The owners of the surface do not think it best to mine the ore and hold up the surface; that would be prohibitive of the mining. About a mile and three-quarters of the South Shore was abandoned,

and in locating a substitute road 2.6 miles was built. The new location is not subject to removal clause; the Cleveland Cliffs gave a bond to certain land owners for any iron ore that might be tied up on account of construction of the new road.

260 The mining, even if not under the right of way, is likely to disturb the railroad. They figure a slope of about 60 degrees, 1,000 feet depth, is liable to pull 700 feet, and 500 feet to pull 400 feet away.

The right of way I procured, about 15 acres, cost $5,000 an acre in addition to the bond. The Cleveland Cliffs employed the L. S. & I. to construct this line, and owned an interest in the company which owned part of the right of way; the price was made by other interests. I think $5,000 was too much, but we were not able to get it for any less.

The cost of construction of a single track of the new road was a little over $80,000, and the right of way about $102,000. The Cleveland Cliffs and Oliver Iron Companies paid the cost. It was necessary to build more line than the abandoned right of way in miles; the line is not less than 100 feet wide—a little more, part of the way.

The price for the right of way throughout would be about $3,500 per acre. Only a portion of the abandoned right of way was underlayed with ore. More ore is tied up than is under the 100 feet. It might be 500 to 700 feet each side of the track. We also built, in 1911, a track to Negaunee Mine, nearly parallel to and north of the above track, across sections 5 and 32; it is marked L. S. & I. Railway. The deed has usual removal clause.

I procured right of way to Negaunee Mine, number 3 shaft, through section 33, S. E. ¼ of section 32-48-26; and N. W. ¼ of section 5-47-26, in 1911. Right of way across N. W. corner of section 5, from Pioneer and Arctic Mining company surface

261 rights with removal clauses, cost $1,350 an acre; we condemned the S. ½ of S. E. ¼ of section 32, and N. W. ¼ of S. W. ¼ of section 33, getting the same rights as by deed-removal clause and waiver of mineral rights.

The N. W. ¼ of S. W. ¼ of section 33 cost $1,111 an acre, not including court costs. The other parcel, with three owners, cost $3,059 an acre, being .85 of an acre at $2,600, .21 of an acre at $2,381 per acre, and .64 of an acre at $2,344 per acre; it cost $1,100 to $3,000 per acre for right of way subject to removal clause. I know that land would not sell for $1,000 an acre if platted.

I am familiar with right of way of South Shore, mile posts 163 to 164 plus. It is practically the same as east end of new line; it crosses same parcel as this $1,111 an acre piece that I have in here. Except for permanency of right of way, the cost of right of way of new line and for line to Negaunee mine would be about equal. The question of permanency or existence of removal clause bears substantially on cost, because nobody knows whether there is any ore there or not.

Am familiar with south line, mile posts 9 to 12; it would average about the same as new. The west end of the south line is right in

among the mines. Do not think right of way quite as valuable on south line as on north line.

We bought another little piece on section 7-47-26, with right to maintain one track for about a quarter of a mile, 1.10 acres, in 1909 or 1910, and paid $5,700 an acre, to build a track to another mine. The $700 was to a tenant for moving a building back. We had removal clause. The South Shore goes right alongside this.

262 Conditions are the same three-quarters of the way through section 18 to within a quarter of a mile of the south line; that is the Palmer or Volunteer branch.

It would be impossible to get perpetual rights at any reasonable expense. In my opinion, you could not procure right of way of Palmer branch with right to perpetually maintain track except by condemnation proceedings. The only thing I have to guide me as to the cost is what was done around Negaunee; I think it would cost $2,000 an acre with the removal clause.

I think fair cost to reproduce Palmer branch right of way subject to track removal $2,000 per acre. I do not think any sane man would go in there and estimate it at that unless he had had some experience in it. Don't think right of way to Mary Charlotte mine, 3.2 acres, would cost quite as much; not more than 40% or 50%—about $2,000 an acre.

I have procured right of way through west end of Negaunee from center of S. W. ¼ of section 31-48-26, down through section 1-47-27, connection with L. S. & I. old main line in S. E. ¼ of section 2, in 1909. It is heavy work, and width is more than 25 feet average. We have 50 feet all the way except part of section 31; on the S. W. ¼ of S. W. ¼ of section 31, and N. W. ¼ of N. W. ¼ of section 6, we have 400 feet; we bought it as lots. Where we bought unplatted part in section 1 by the acre, we paid $1,000 an acre. It belonged to same people our road belonged to. Right of way bought at that time contains 4,603 feet of track to west line of section 1, and cost $45,288.45, making $9.84 a foot.

Another description, of 1.73 acres, cost $7,000, or $4,080 an acre. Adding that 760 feet, would make 5,363 feet, at $9.80 a foot.

263 The 760 feet of 1.73 acres was acquired by condemnation, and took entire surface; the owner did not own the minerals. There is some question whether it included any right to sustain the surface. Owner was Samuel Collins, and description the W. ¼ of S. W. ¼ of S. W. ¼ of section 31-48-26. I think they got too much. They claim value to be there on account of platting purposes. You would be surprised if you could see the prices that we had to pay for lots there; I would not have believed it myself.

The value of that parcel, as compared with reproduction cost of right of way of South Shore through Negaunee, is a good deal less. You could not buy right of way through where South Shore Negaunee station is. The parcel above described cost $9.80 per foot for trackage rights. Strategically, South Shore is in a great deal better position than this new line; it is right in the center of the business part of town, and this is on the outskirts. It cost us $258,000 to

build that piece of track through there that we would not have been obliged to pay had we had a perpetual right of way on other line.

I have acquired other right of way through this same point, or through between Ishpeming and Negaunee from west side of the platted portion of Negaunee to west city limits; we got just width enough to lay our track, at $1.55 a running foot, for 3,305 feet. There is removal obligation there.

Comparing rights described with those of South Shore, alongside, I feel hardly competent to make comparison; we are only tenants at will. Width occupied by South Shore is in some places greater than ours, and would average 1½ as much. For north track, my
264 experience in procuring this last job of right of way would be a fair guide to fair cost of reproduction, except their rights are a little better than ours.

We made 2 or 3 condemnations in Ishpeming, and all looked ridiculous to me. There is a little house on a triangular lot where we crossed South Shore track; we took off a triangular piece of the lot, about 50 feet on one side and 40 on the other, which did not involve any difference in the lot, and question of the proximity of railroad did not cut any figure, because South Shore ran right behind the land. The jury allowed her $2,000 for cutting off point of that lot.

Another place in Ishpeming, where Pine St. crosses L. S. & I., we acquired a license, subject to redemption if needed for mining purposes, of 1.15 acres, for building track, costing $787.58; re removed rock, at cost of $1,181.50, and in addition moved a lot of houses and things which cost us, with the removal of a city water main and the building of another street, probably $2,500.

I procured right of way for extension to North Lake mine, 4.3 miles. We paid owners a thousand an acre for surface rights and tenants $50 an acre for theirs, from west line of section 10, in Ishpeming, to city limits. Tenants had cleared ground and had it under cultivation. From that point to North Lake, Excelsior Iron Co. owned all but one description. We paid tenants from $48 to $75 an acre for their clearing and cultivation, and $100 an acre to the owners, plus attorney's fees.

On one piece, in section 5, to get 3 acres we were obliged to take 5, for which we paid $1,000. We were building to the Excel-
265 sior Mining Co., and $1,000 an acre was paid to it for its lands; that company is owned by Cleveland Cliffs, which owns a majority interest of L. S. & I.; 60% ownership of railroad company and mines were identical. The president of the L. S. & I. is president of Cleveland Cliffs and has quite a voice in the matter in both cases. His contention is that their company should get what other people get and accept for their rights.

We have been able to get right of way from Cleveland Cliffs at a little less in every case than through outsiders; think it is all too high, but we cannot get it cheaper. For comparison, we paid the Cleveland Cliffs $1,000 an acre for the N. E. ¼ of N. E. ¼ of section 1, and in condemnation $4,080 an acre to an outsider for parcel in S. W. ¼ of section 31. Cleveland Cliffs parcel was nearest to town and worth more per acre. I offered Collins $1,000 an acre, rather

than go into condemnation. Conditions in Ishpeming and Negaunee are just as good today for getting right of way as they ever will be, and I think better.

If railroad was out of there, and that 25 feet owned by those who owned the abutting lands, there would be an element of damages on account of injury to property and lands not taken. It would cost $50 to $75 a running foot to get that right of way through there, perhaps more; I mean that is just the value of the property. If lots and blocks covered land now occupied by South Shore, chances are you would have to pay damages amounting to another $50.

By reference to Complt.'s Ex. 6, Riggs, (Marquette) lot 1 was acquired by condemnation, for freight house grounds, on Lake Street. There is 500 feet on Lake St. at foot of bluff, below Ridge street; it runs back 145 to 163 feet, contains 1.7 acres and cost $14,10).

266 It had no water rights; was part on hillside,, with 6 owners. Probably half of it was useful. There were 3 or 4 houses, which we gave away for tearing them down.

We bought the site of our present depot, corner Washington and Lake Sts. in Marquette, 4 years ago, 2.34 acres; .67 of an acre on hillside, and 1.57 acres good ground. We paid $50,000, and worked over the old shells of buildings into our offices. We called the buildings worth $25,000 and the land $25,000.

A couple of years ago, we paid for trackage rights near Hampton St. There was a lot 40 feet front on Lake St.; we paid $250 for abutting damages for building on opposite side of street. Ten years ago, we bought lot 1 in Edwards' Add., between Garden and Mesnard Sts., 200 feet by 446 one side and 504 the other. It had an old stone house of no particular use on it, and cost $8,500 plus some taxes. By the Chocolay River, 300 or 400 feet from South Shore road, we paid $1,000 for .9 of an acre, for right of way. There was a house on the front part of lot.

267 YOUNG.

Cross-examination.

By Mr. Wykes:

I was connected with 1900 Michigan appraisal, and testified in 1902 appraisal. For 1900 appraisal, I made inspection of railroads in both Upper and Lower Peninsulas to determine grading, ballasting, etc., going over the road on a hand car, making 35 to 50 miles a day, except where there were a lot of buildings, bridges or sidings.

The recent inspection of D. S. S. & A. was from back end of a private car on special train. We spent two days on the line west of Marquette. Train was moving most of the time; we stopped and examined a few bridges and a few buildings, but did not stop to examine quantities of earth work. From character of inspection, there would be liable to be some variation from figures obtained for quantities of earth work. Nobody can look over a piece of road and absolutely assert that there are so many yards, and no more or less.

I considered judgment I gave conservative. It may not be ab-

solutely correct. Without measurements of cuts, fills, slopes and heights, it is a guess. The best way is to estimate from the profile and add proper percentages; I didn't attempt to make an estimate, except to give judgment on an estimate I made for the purpose of checking. On an inspection of the character I made, there might be a variation of 20% to 30% on the actual yardage. Same thing would not apply to the rock. I am satisfied that this would be much more than the figures I gave. I would not be surprised if there was three times as much. The variation of my figures from actual solid rock might be from 20% to 40%. I think variation would be over; I don't think there could be any variation under.

Shrinkage is the earth moved necessary to put into a fill over what you can measure in a cut. It is always necessary to put more earth in an embankment than you can find in the cut. An
268 engineer putting shrinkage on embankment always sets his grade stakes a certain percentage higher than his actual grade. You cannot set your grade stakes 10% above grade you want, because it might not shrink that 10% before you got ready to lay track. You have got to take care of shrinkage sometimes in extra widths—putting it on the side of the embankment. To each original estimate of yardage, after estimating profile as near as I can, I add 10% to all quantities, to take care of shrinkage and embankments, the extra yardage and cuts due to the side hill slopes and surface ditches and such things. Measurement and payment for earth quantities is on earth in place in the cut, which is packed earth.

The contractor is paid a place measurement on excavation. In making estimates from the profile, the fill embankment nearly always overruns the excavation. In order to get whole estimate you must take embankment estimate for your figures, or cross-section all cuts before you make your estimate; therefore, figures you get estimating your profile are embankment rather than excavation figures. You add the 10% to take care of excavation figures, such as contractor is paid upon. Figuring for purposes of payment, you figure directly upon cut, while, figuring for purposes of appraisal, you figure on the fills. If the cut happens to exceed the fills, then the cut estimate would be taken, rather than the fill. It gets back to the question of whether, in estimating the profiles, estimate was made on the fill quantities or on the cuts.

Overhaul is the distance beyond free hauls; the contractor, for a stipulated price, agrees to haul material for 500 feet; for every hundred feet past that he gets a certain price per hundred feet for hauling. In this territory, 500 to 1,000 feet is the free haul. It de-
pends on character of work and kind of equipment: if done
269 with wheel scrapers, we usually make the free haul 500 feet. If better to use tram cars and track, then it is 1,000 feet. The 30¢ price would cover either 500 or 1,000 feet. For overhaul, the usual price is 1½¢ per 100 feet per yard. I have known it to be 2¢, and to be 1¢. I have known, and let, quite a number of small contracts at 1¢. In making an appraisal, if you are going to get at cost of the property, overhaul is to be put in. I would not include

that item in contingencies; it is not difficult to get at, if you have the profile to work from. When the contractor is paid, you have actual, instead of estimated quantities. If you had sufficient data to get at price of overhaul in any other way, it should not be included in contingencies.

Contingencies is to cover those things you cannot get at. The question of whether things of that kind were or were not included in contingencies would affect rate that should be added for them.

In the place near Taquamenon swamp which I described, speaking of filling and putting on extra trains of sand, I would not put it under contingencies; I would add that percentage to earth work when I was making the estimate. If I found that profiles show 5,000 yards to the mile, in making my pre*mil*inary estimate, I would say that it would take 10,000 yards, if I knew that swamp was there; and I would know, because we always know what kind of land we are going over. I suppose for inspection of completed road it might come into contingencies, but it would have to be a larger contingency than we have ever used to cover it. I do not think that it ought to go into the contingency. An engineer with judgment enough to know would cover it in its yardage by a percentage, in the first place. The company's records might show the yardage now, but would not in the old days.

270–1 I intended to add a percentage for shrinkage, and then another percentage covering what I mentioned in the way of ditches, road crossings, etc., that are not usually taken in. I did not add any more percentages, but said that in the case of a large swamp 10% wouldn't be nearly enough; it would there take nearer 50% for shrinkage, which I would add as a percentage to the quantities. That applies to a swamp. A sink hole is a depression grown over with vegetation. The weight breaks through this crust and you must fill in the hole. The amounts required for sink holes would have to be included in the estimate, which would be difficult.

My experience is that, after you have gotten at everything as best you can, then you must add a percentage for contingencies to take care of things you cannot find.

A surface ditch is sometimes placed on the edge of the right of way, to keep the water from coming into the cut, or seeping through the sides; it drains the top of the cut, and is put in, either at the time of original construction or afterwards, by section men, when needed. Crossing fills are made for all existing crossings at time of construction, before the road is turned over by the contractor.

The first two or three years the roadbed is settling, and the work done on it goes into permanent construction and becomes an asset to the road itself. You must have extra section men during this time, as well as extra work trains and extra work in the engineering departments. On our road, if we can do this work with regular section men, we charge it to operation, otherwise to capital. Section labor always goes into operation. Our road and the Northwestern generally make authorizations and put on extra trains and gangs to do this work. It is then charged to capital.

272 I am not sure that all railroads charge the work in parts of roadbed during first few years which I stated was construction rather than maintenance, to capital; as long as it goes to betterment of railroad, it is an asset and an added value to the road, whether charged to capital or maintenance. In my experience, a road, if properly kept up, becomes easier and less expensive to maintain with age.

In one case, where we purchased 5 locomotives, shop inspection and freight amounted to 2%, charged to the locomotives; when a new locomotive took the place of these, there would be a new engineering charge on the new locomotives.

South Shore uses a 7 inch standard tie; ours is a 6 inch. We paid 38¢ alongside our track for 6 inch standard cedar ties. We do not want to buy any, so we put our price very low; 23¢ on hemlock and tamarack, to 19¢ for culls, is the price posted for 1912. Last year, I paid 30¢ for hemlock, and the same for cedar. I bought tamarack or hemlock ties, that seller would rather we would take than bother with shipment of less than car load, at 23¢; a few they could not get rid of any other way. We paid 37¢ for hemlock and 47¢ for cedar, to Northwestern, where we have joint maintenance on tracks, or in exchange of tracks, and charged the same price to them; then they charge 15% for freight, counting and handling.

I figured my ties at 55% of their value new, where renewals are sufficient to keep up the depreciation within the life of the tie, where in normal state of preservation. I figured there is one tie in the track good for a year and one practically new; you average a tie that is good for one year and tie that is good for 10 years, and it will give you 5½, or 55%. I figured there is no tie in the track not good for a year. We always have a factor of safety on ties, the new tie

273 is on the ground and has been charged to the track, or if you take it after it is in, the last tie is good for 10 years and the first one good for one, making an average of 55% in either case. That is when track is in normal condition and ties are running to their limit; if the life of the tie were 9 years and renewals on the basis of 11, they would be run two years beyond their safety point, and they would not be at 50%. The fact that the average life of a tie might be 9 years and you left it in the track 11 years would not mean that they were two years beyond safety point, because there is a very great variation in the life of ties; some will last double what another of the same kind will.

The average life of a cedar tie is 12 years, but some will last 25, and some must be taken out in 7; average life of hemlock and tamarack is 6 to 8. I would not say it was possible for condition of ties, in a main track being used, to go below 50% with safety. Ties with average life of 9 years might in a certain piece of track run 11; it depends on nature of soil. We take them out on inspection. On a straight line, you can allow a tie to run a little longer than on a curve. Section foreman makes his inspection, by going over with a pick, testing ties to see whether rotten, and estimates number of ties to be put in, after which roadmaster goes over and checks him up; road master walks over the road, usually, or goes on a hand car where he can see it, but that is only to get at the estimtae of ties needed that

year. Sometimes a road would stand 2 years without ties; I have seen that done without renewals, when they think they are keeping it up in normal state.

I do not remember just what my grading price on South Shore cutoff figured out at; I don't remember that I ever figured it. My estimate was 30¢ and it ran very close to that. I don't think I ever furnished South Shore or Mr. Riggs with actual yardage; Mr. Riggs' approximation was estimated yardage. I might have furnished correct tally, but do not think so; I furnished a profile with
274 estimated yardage on it to South Shore. The total cost included everything, including rock, that went to make the expense of the work. I don't remember that rock was separated from the other work in my preliminary estimate; my 30¢ did not cover rock work. I had two contractors figure on that work before it was done, and one made a price of 27¢ or 28¢ and another of 33¢. I don't know what accounted for the difference between them; the higher one was a little afraid of the sink hole, and the other man's outfit was a little closer by.

In past few years, our company has done grading at less than 30¢; on the short spur west of Ishpeming we let part of it by contract to a small contractor for 24¢. We did the heavy part of it ourselves, that being a steam shovel job, and a long-haul—about a half mile—for 30¢; it was all fill, to build an overhead crossing in Ishpeming. The question of overhaul not so material in steam shovel work; on South Shore cutoff, nearly all the work would have been more than the earth price due to overhaul. So that method—paymen' for overhaul—would have cost more than 60¢, instead of 30¢. If material were there to borrow, it would be impossible for an overhaul charge which reached or went beyond the contract price for moving earth, due to fact that when overhaul becomes too great you borrow from other pits.

On a careful inventory, it is impossible to see and get everything. The percentage for contingencies should not be below 10; unless proper care is used, more than that is probably needed. Contingencies is for items not anticipated in construction. After road is completed, some of those items have become visible, and are capable of inventory, but the larger part of them are not; if I were able to sit here and list the items, they would not be contingencies. The theory of the contingency is that the items are there and have to be paid for.

275 Lowest price we paid for right of way in Ishpeming and Negaunee district was, Ishpeming to North Lake, $100 an acre for right of way and $50 for settlement with tenants; that is west to our North Lake mines.

YOUNG.

Redirect examination.

By Mr. Butler:

A comparatively high proportion of South Shore mileage in Michigan is tangent or straight line. The high rail on the curve wears

off on the guage side only; very little wear is on the top of the ball of the rail. The inner rail wears on the top only. (The witness produced a chart—Complt.'s Ex. 18, Young—showing the different way- rail would wear in different places.) On a tangent, with the same amount of service, rails would show very little wear. The outer rail of a curve is worn off much more than the inner. The outer rail is worn on guage side, in some cases, enough to make it necessary to remove it. The outside rail on a curve may be placed on inside, and inside rail on outside; when so transferred, the rail does not wear as rapidly as a new one would in the same place, but will last as long, or longer, on account of its having been cold rolled with the traffic.

Rail removal from main line track or curve is excellent for less important lines, putting the unworn side toward the guage side, and the worn side out.

YOUNG.

Recross-examination.

By Mr. Wykes:

My testimony with regard to rail wear and use of rail on curves is dependent partially on study of experience on B. & O.,
276 though I recently made some study on it myself and calipered some rails. The traffic on the L. S. & I. is very heavy in freight. Our rail wear is heavy on curves, but not on straight line; we have about 50% of curves, which is a high percentage. Our traffic is ore, in full trains when they can get it; very often they run with light trains. I am not able to tell what one train does wear the track, and it would be impossible to know what wear is due to one character of traffic, and what to the other. Weight and character of the cars, and whether curve is on grade or level track, are factors. The curves wear more rapidly than the tangents; that a curve occurs on a grade makes no difference in wear, but it does in the resistance to pulling power of locomotive. I don't think a locomotive drawing a heavy train wears the track more than a light one; it is the engine that wears the rail, more than the cars. The power of the train comes from contact of engine wheels with top of rail, and not with the guage side of the rail, which does not wear unless the engine slips.

Wear of rail or fastenings, or depreciation of ties due to derailments, is a considerable item during construction; I mention it as a contingency of construction. It would also exist more or less in operation. There would be less derailment of passenger trains than of freight, on account of the greater care in inspection. I did not notice any rail on curve on South Shore, on inspection trip, that was worn very badly.

On January 7, 1914.

YOUNG, recalled by Plaintiff.

Direct examination.

By Mr. Eldredge:

I know the south yard of the South Shore in Marquette, and have seen Complt.'s Ex. 1c, Riggs, Parcels 6, 7, 11 and part each of 12, 13, 14, and 16 (Marquette County), totaling 18.85 acres, are included in that yard. In figuring the area of the yard, I in-
277 cluded streets used, making altogether 25 acres. In my judgment, this yard has a special adaptation for railroad purposes.

Mr. Wykes: Just a moment before you answer, I wish to object to it as immaterial and incompetent and not the proper way to fix the value of a large tract of land which in acquiring must be acquired in individual parcels; that is, if the problem be to acquire, it must be taken in individual parcels and not as a whole, and it is not the value to the railroad company, and this method is a method which seeks to get the value to the railroad company.

That value may be arrived at by considering it in comparison with the next best parcel of land of proper size for the same purpose, comparing the cost of purchase, construction and operation of yards on both parcels. There is no other site as well adapted for a yard, both in point of cost of construction or in economy of operation, as the south yard.

The next available site is the ore yard, just west of the present shops and roundhouse. It would comprise two strips of land, one 230 feet wide by 1,600 feet long, parallel to and 50 feet north of the center of the present main track, and the other, 456 feet wide and 1,600 feet long, parallel to and 15 feet south of the center line of the present main track, beginning at the western boundary of the south half of the northeast quarter of Sec. 22, 48-25, and extending easterly 1,600 feet—25 acres, the same area as the south yard. I made an estimate of comparative cost, assuming the building of the track to be the same, the only difference being in grading for the tracks. The difference in the cost of grading is $48,735. I assumed the track material, laying and ballasting to be the same on the new yard as on the old. I assumed that, if this yard had been built in some other place, it would have been built under the same conditions it is in now—piece-meal, as they needed it—and that the conditions of building the yard would be practically the same in one place as in the other.

278 The substitute yard would cost much more for operation. I made conservative figures on the cost. The first item of additional cost is handling coal—130,000 tons handled last year. It would be necessary to handle all the coal the additional distance to the new yard at a yearly cost of $803, which, capitalized at 5%, makes the additional value $16,060. The west bound freight trains yearly

cost $1,003, which makes a total cost of $20,075, and the freight trains east of Marquette, both east and west bound, cost $1,204 annually, capitalized making $24,090. I figure the coal two and a quarter miles, and the freight business one mile, both east and west, extra haul. All freight coming into the alternate yard stopped there; there would be no extra haul. The west bound freight from Marquette would have to be hauled around by the south line, an additional haul, and both east and west bound freights east of Marquette would have an additional haul.

I included in this estimate the cost of train operation only. There is a legitimate expenditure for replacement of cars and maintenance of track, which would bring the actual cost, in my judgment, much above the figures named; that has not been included. The total difference between the cost of construction and operation of the two yards would be $108,960, according to my estimate, which would in my judgment represent the value of the special adaptation of this yard for railroad purposes. If the value of the land in the substitute yard and in the present south yard were the same, then this $108,960 would represent, in my judgment, the special value of the south yard.

I know the value of the south yard land is more than in the substitute yard. In my judgment, to arrive at the true special value of this land by reason of special adaptation to railroad purposes, it will be necessary to determine the market value for other purposes of the two sites, and, if the value was greater in the present than in
279 the substitute yard, deduct the difference from this total of $108,960.

The 130,000 tons of coal represents the haulage of coal to Negaunee or points west, taken from the South Shore dockage. I figured the item of expense on other freight on five west bound trains from Marquette, and three trains each way east of Marquette, making six trains east of Marquette daily for the year, including Sundays. I got my information from the Chief Train Dispatcher. This substitute yard is located on both sides of the main line, and would need no new track, except the yard itself. I would not put it on one side, on account of being more economical to grade it on both sides, and because the objections to having it on both sides of the main line appear in the south yard as well.

YOUNG.

Recross-examination.

By Mr. Wykes:

The substitute yard could be located on one side, and reduce the expense of operation somewhat, but not reduce any expenses of operation to which I have testified. It is an inconvenience to have your main line running through your yard. The amount it increases the yard expenses depends on the amount of through traffic. The east end of the substitute yard would be 4,400 feet from Front St. Part of it is on description 33, Complt.'s Ex. 6*a*, Riggs. It begins west at the boundary of description 33, and runs 1,300 feet east. It takes in

lands already owned by the railway company, except so much of it as falls on a piece north of the track, 528 feet long by 345 feet wide.

The coal on which I figure an extra cost is only that hauled through to Negaunee and beyond. I figure the extra cost due to having to take the coal from the unloading point up into this yard and then haul it back the distance it must be hauled back to get it onto the west bound track. Coal goes to Ishpeming and Negaunee over the south line. A maximum of ten large cars can be hauled up the hill. There is not room in the yards adjacent to the coal dock, aside from the south yard, to switch and get together a train of that size. That coal plant is used by the L. S. & I. and the South Shore, and there is no room for storage of cars there. The L. S. & I. brings its cars down from the yard and leaves them on the passenger track when it is not used by passenger trains. We make up all our trains at the west yard, after the coal is loaded. I assume that the coal would be taken to this other yard.

280

There is an extensive yard now, east of this point, used for storage and sorting of loaded ore after it is weighed. If arranging a new yard at this point, they would arrange it so as to best handle the traffic. If they could handle the ore farther west and the coal farther east to the same advantage, that would be done. That would make an extra haul on the ore cars, instead of the coal. The ore cars all take the south line out.

The figures given are minimum costs. It is an approximation, in which I have attempted to be conservative. I did not go into close fractions of miles, but took half a mile as the distance, when it was actually a little more. I used five per cent, because my experience is that that is a low figure for capitalization of railroad properties now. At six, I get a lower value, and at seven a still lower value. I use five per cent, because I thought it a fair average for capitalization. I don't attempt to say the money could be gotten for that. It is a value that we use entirely in leasing railroad tracks around here.

281

I figured my extra distance for west bound freight from the freight house to the new yard. The through freight coming from the east would have to be taken to this new yard and back again. The distance would be longer than I have used. I treated it all as local freight. I do not think any freight on the South Shore goes through Marquette without breaking trains.

On February 12, 1914.

YOUNG, called by Plaintiff.

Direct examination.

By Mr. Eldredge:

I have given some study to the question of apportionment of M. of W. & S. expenses between the passenger and freight service. It is impossible to actually divide the causes of these expenditures in a great many cases between the different classes of service, and, consequently,

it is necessary to adopt some arbitrary method, based on the proportion of the use of the causes of these expenses. In my judgment, dividing these on the revenue train mileage is the only fair basis.

As civil engineer, I have had charge of maintenance of way and structures for a great many years. In the course of my employment, I have had to consider the extent to which the two classes of service, freight and passenger, tended to cause the expenditures necessary for maintenance of way and structures. I have to review all the accounts every year, make annual reports of all the expenses in my department and explain the causes of their increase or decrease. That would not specially involve discriminating between the wear and tear caused by freight service and that caused by passenger service, except it does have to do with the wear and tear caused by trains, as units, and their relative weight and speed. Considering them as units, and their
282 weight and speed, would cause discrimination between freight and passenger. I would except from the revenue train mileage basis but three items of the I. C. C. classification of maintenance of way accounts; i. e., docks and wharves, maintenance of joint tracks, yards and other facilities, debit, and the same item, credit.

As to the buildings, fixtures and grounds, a part of those could be allocated between the different classes of service, but the unallocated parts are, in my judgment, properly divided on revenue mileage basis. In maintenance of way and structures accounts, certain elements of expense are not attributable to train movement, but to the action of the elements; those are; part of the ballast, a percentage of tie renewals, and quite a large percentage of bridges, trestles and culverts and over and undergrade crossings.

The whole of the item of over and under grade crossings would be due to the action of the elements, as would fences, cattle guards and signs, snow and sand fences and snowsheds, telegraph and telephone lines, and buildings, fixtures and grounds. I adopt the revenue train mile basis for the division of expenses due entirely to the elements, as it seems to me that the train mile is the unit of service into which the traffic is divided, and as that unit has more of the elements of the cause of these expenditures than any other way of division could have. The cleaning of roadway is done for two reasons, the primary reason being protection from fire, and the secondary reason being appearance, entirely on account of passenger trains. There are two causes of fire; one is the locomotive, and the other the open windows of the passenger train smoking car, which is quite a prolific cause of fire in this country in summer.

I have known quite a number of cases where fires have been
283 caused by throwing cigar stubs from smoking car windows, and many other cases where they could not be otherwise accounted for; e. g., where a passenger train causing fire was coasting down a grade and not working steam, and there wasn't any spark flying. I have personally found cigar stubs in rotten stumps that caused a fire, in 15 minutes after the fire started.

In many of the items, the additional speed of the passenger train offsets any additional weight of the freight trains; that is true on

bridges, to a great extent. The damage to bridges is caused more by train impact than by the actual dead load, and the impact is very much greater as the speed increases; the impact causes the vibration, and the vibration causes the danger to bridges.

In repairs to track, the freight train on a well kept up tangent would be a little harder on the track than a passenger train, but on a curve a passenger train causes more damage, because the outer rail must be elevated to suit the passenger train speed, and on that account the freight train causes considerably greater damage than it would if the elevation was right for the freight train; also, it reduces the load the freight engine is able to pull around the curve. Especially on a road like the South Shore, where they have no tie plates on curves, it causes cutting the ties by the rail, canting over the inside rail, and spreading the track, making it necessary to reguage often and adds tie renewal. Another item is the creeping of rails in soft places, which is aggrevated considerably by the excessive speed; that is an item that should be divided into train unit.

In removal of sand, snow and ice, there is a difference in favor of the passenger trains, due to the necessity of keeping the passenger trains moving during snow storms. It is customary for freight trains to be left in during heavy snow storms, because it would be impossible to do any work along the road anyway, on account of not
284 being able to get into the side track, but the snow plows are run to keep the passenger trains moving, and the work they do must be done over again when the storm is over, to clean the road up for general business, as the snow fills in behind the snow plow.

To offset that, there is some cleaning of switches, done more for the freight than for the passenger trains; shoveling out of drifts happens occasionally, when the drifts are larger than can be taken care of by the plow, but, on the other hand, there is shoveling to be done on side tracks that is for the freight service only. I mean that the cost is increased by reason of being obliged to run the passenger trains, and that the greater cost, if there is any difference, should be attributed to the passenger trains.

On the South Shore, winter maintenance would come under item, Roadway and Track. That item is almost entirely labor; in winter, it is nearly always shimming track on account of heave spots, and this is necessary in direct proportion to the speed of the train over it. Shimming is much more necessary for passenger than for freight trains, because the passenger trains run at greater speed, and it is necessary to keep them riding smoothly for the comfort of the passengers. Shimming is quite an item of track maintenance in this country in winter. Without shimming, the track is not safe, especially for high speed. Taking out the shims is quite an expensive job, and must be done at exactly the right time.

The items to which I apply the revenue train mileage basis would on that basis be equitable divided between the two services in the proportion that each had caused the expense; in my judgment, that is the most equitable way. In the absence of any absolute figures as to which class of trains causes any of these expenses, this arbitrary method of division would be nearer to the actual facts than any other method.

285 I don't know that I am competent to testify with respect to the speed of South Shore freight and passenger trains; this question refers to depreciation of equipment, with regard to which I did not intend to testify. I intended to testify only to the depreciation of items under M. of W. & S.

When I said curve elevations not suited to freight service would reduce the hauling power of locomotives around the curve, that is a matter of engineering calculation; but I could answer that only in theory, not having any practical knowledge of the effect on maintenance of equipment. In theory, I think it would increase the maintenance of equipment to some extent. Having in mind services performed by freight trains for passenger and common service, company material handled in revenue freight trains usually is quite a considerable item—the handling of ties, rails, scrap iron, and of material going over into passenger cars and engines. Even coal is sometimes handled in a revenue train. I do not know whether that is charged to the coal or not; It is on this road.

YOUNG.

Recross-examination.

By Mr. Wykes:

I have never testified to the propriety of the revenue train mileage basis for division of common expenses between passenger and freight before; at best, that is an approximation. I do not attempt to say that the division, when made, states the real expense caused by the passenger or freight service. I do not attempt to absolutely place the actual expenses; I don't think it can be done. I only make this basis as an arbitrary basis for the division, and as being the best arbitrary basis. I do not believe it can be done to any degree of refined certainty. My judgment is it is the fairest basis that has come to my attention. By arbitrary, I mean it is merely a

286 method decided upon on which to make this division; in some cases it will favor one class, and in others the other class, of service.

I meant by arbitrary that it was a method to be followed even if in some instances it was absolutely correct, as long as we are unable to get anything nearer correct; I mean it is a basis that goes outside the direct charge or direct expense, and takes some general rule of division. The reason I select this basis is because in my judgment the train mile is the unit of service.

I have never been called upon to compute the cost of a passenger or a freight train mile, or a series of either. It has been done by some accountants, as near as they could arrive at it, but I do not know how close they did arrive at it. It was done as an accounting, rather than an engineering proposition.

I have never for a railroad attempted to determine the cost of doing its passenger business. The passenger train is not the equal of the freight train in average length, number of wheels, tractive

force required to pull the load, number of wheel impacts, or amount of coal required per mile.

Starting with those two unequal elements, I state that the passenger train ran at a faster speed; that, other things being equal, would add to the cost on the items we have been referring to. I have studied the comparative cost, but not to get at it as finely as to find the degree of extra cost that would result from the greater speed, or to say how much more cost would result from running 40 miles an hour than 20; I could not pretend to give percentages, but I have made observation on the track, and been put to considerable extra expense on account of the increased speed of passenger trains over what they had been running before, and other trains as well.

287 Those tracks were tracks over which, at the time I made my o' servations, both passenger and freight trains were running constantly. The thing I referred to was absolutely certain. In the case of wear, the track had heaved slightly, but not sufficient, as we thought, to shim it; our time for passenger train between two points was shortened, increasing the speed, and we were obliged to brace and put tie plates and shims on this track, in order to keep it to gu*a*ge, when we had no trouble before the increased speed. If the track had been in perfect alignment, the extra work would not have been as heavy, but it was a typical winter condition in this country. I have not gone so far as to attempt to express in percentage or in amount per train mile the amount or degree of extra cost that would be required by the faster moving passenger train, and do not know any one who has. I know in a general way the relative speed of South Shore freight and passenger trains; I have been riding on them both quite often; I do not think I could give their average passenger speed, and I do not know the maximum permitted by their rule. I do not know their average or maximum speed for freight trains; I know until recently the extreme speed permitted by rule for freight trains was 20 miles an hour, but I don't know what it is now. I have never observed that they exceeded this maximum.

On the question of speed, the amount of tangent or curve enters into the question of the extra weight that you must give to the speed. I have not made a study of the amount of tangent and curve on the South Shore to reduce it to percentages, but I have been over the road a great many times, and I know in a general way how the road runs for tangent and curve. Railroads vary in the amount of tangent, the amount of curve and the rate of speed; that causes a variance in the accuracy of the revenue train mileage basis, applied to railroads generally, as a class.

288 There might be a slight variation, but, taking it as a whole, I do not think, so far as my observation has been, there is any material difference on any great length of railroad in this vicinity. I know sometimes they claim the revenue train mileage basis to apply to all railroads generally as a basis of division between passenger and freight. If it were applied to the South Shore, I would not say whether it should or should not apply to the Michigan Central, without giving the matter more study as to condition.

Q. Have you made any investigation to determine the degree of

accuracy of apportionment of expense that can be reached in the application of the revenue train mileage basis on the South Shore?

A. Personally, I do not think that there is any way that you can prove or disapprove what is or is not correct or accurate.

Q. And it gets right back to this, does it not, when you consider the whole subject, it is just a matter of your judgment?

A. Well, that is all I claim, that it is my judgment of what is the proper basis. I would just go back to my statement that it is the most correct basis in my judgment; it is the nearest to the correct basis of any that I know, and also that I have made a great many observations to prove in certain different items. That is the direct effect of the train as a unit on certain conditions on bridges and track, but not to reduce it to percentages or actual cost.

In instances I have watched the effect of each particular train on certain things independently of the other; e. g., I would be under a wooden trestle watching the effect of the impact of trains on it—a freight train and a passenger train striking and going over the same trestle in an especially weak part I was giving consideration. In some cases, it was a question of creeping track, where I wanted
289 to determine the effect of the different trains on the track; and then this other case, the effect of the high speed trains in spreading the track.

In addition to the speed as weighting the passenger side of the wear, I spoke of the super-elevation of curve due to the speed. That is a very material element in the cost of maintaining curves and ties thereon; it also produces some influence on equipment. That is something that probably takes more of the track men's attention than any other one thing, due to the passenger service—that, and the shimming. In order to determine the weight to be given to the elevation of curves, it would be necessary to give consideration to the amount of curve, and to the degree of elevation, which must be in such condition as to allow the maximum possible speed, if necessary. They must also be in condition to care for the maximum possible speed of freight trains, should that exceed the passenger train speed. I do not think greater weight at the same rate of speed requires greater elevation than less weight; there is no recommendation by any engineering society that recognizes any greater superelevation for heavier than for lighter engines, even on the same speed. The weight hasn't anything to do with the formula.

Q. Now, the precise loading of the passenger side, due to the existence of curves and elevation, you have not been able to work that out as a percentage?

A. No, I never attempted to work it out in percentages or in any other way, except we know when we elevate a curve, for instance, for passenger train speed, that the low side of the curve takes the whole load of the freight train and continually increases the elevation, and it is necessary to take up the low side very often—usually once a year, or even oftener sometimes.

290 The wear on curves is due to the tendency of the inside wheels of the engine to travel faster than the outside, which keeps the flange against the outside rail; the gu*a*ge side of the inside

rail never wears on a curve. The only way rail fails is by flowing of metal caused by the slipping of the inside wheel. If done before the rails are too far gone, they can be transposed, and the cold rolled metal is better for the traffic than if it had not been in the track before.

The fact that the passenger train, due to extra speed, is on the track half the time of the freight does not, in my judgment, reduce the fire risk; it makes almost as many exhausts, and our records show more fires from passenger than freight engines. I have considered that the freight trains move under full load, at the maximum power, and burn more coal. I think from the locomotives alone the fire risk would be about equal.

For sand, snow and ice, there is considerable hand digging, around terminals, cleaning switches, which is quite a considerable cost, but the switches must be cleaned in order to use the main track for the use of the sidings, it being necessary to clean the switches to make the main track safe, both in the country and in the yards. Every switch has to be cleaned, and that is a considerable part of the expense. The snow plow is put on to clean for both purposes; the passenger trains are kept running during the storm, when freights are not. This snow plow work during storms is not as good as permanent cleaning.

Frequently, the snow plow goes over the road twice the same day, and still leaves the road blocked at night. Some of the side track cleaning is done with snow plows, and some has to be shoveled; usually, no more men are employed on this account, but the men
291 use their spare time between storms to clean up; that is, the men in the yard, and section crews.

The shimming is usually done by the regular crews, the size of the crews being guaged by the amount of shimming and other work. Usually, we have as many section men in winter as in summer, when we have a heavy fall of snow. The shims are taken out in the spring by the regular section crews.

As to weighting the passenger side of the cost, I mentioned the carrying of company freight in freight trains. The weight that should be given to this varies in proportion to the traffic; I would not attempt to say how much that was, but, of course, there is a considerable amount of it done.

The carriage of workmen on passenger trains is usually inconsiderable, the larger number being carried on work trains. On passenger trains is carried more or less material, supplies, company mail, and passes for both classes of traffic, and the companies' employes of different character. I have not attempted to refine between those, but merely mentioned that item as being worthy of consideration. I do not think of any other thing that would weight the passenger cost, speaking generally of the items mentioned.

Q. You have not determined the weight that should be given to any one, or to all of those collectively, have you; any one separately, or all collectively?

A. Not any definite figures at all.

There are some things which would make the cost of the freight

side heavier; among those is the greater freight tonnage. To determine whether that had sufficient weight to counterbalance the speed would involve an investigation into that greater tonnage; that would affect some of the items, but there are many that it would not affect materially. I don't think there would be any way of measuring that effect. I don't think it affects any item very
292 much, unless it be the wear of rail, the maintenance of track on tangent, and re-surfacing track. I don't think it affects such items as bridges, though you very often have to strengthen bridges for heavier locomotives. I don't think you would have to get the number of wheels and types of your locomotives in each class. Of course, the comparison between the classes of locomotives would have some effect.

Bridges seldom fail on account of dead load; they fail on account of impact and vibration, more than any other way. According to my observation, the impact and vibration is not longer and does not become more violent through the passing of a long freight train as the end of it passes over the bridge. The greatest strain on a bridge is when the engine first strikes it, and then it settles down to a steady uniform strain. If the speed was the same, the impact would increase with the increasing weight. Impact is a very uncertain thing with the best engineers; we merely know that impact causes a lot of trouble, but it is pretty hard to measure it.

I did not give any account, in applying the revenue train mile basis, or in saying it was proper, to the greater length of time that a freight train uses the track in making a given mileage; I do not think account should be taken of this. I did not take that element into account in fixing weather costs. I did not take into account the fact of whether freight trains are or are not as carefully inspected, and whether the wheels are or are not kept up and as frequently inspected, as passenger trains. I did not take into account the greater number of derailments, etc., in the freight service than in the passenger service. I did consider the different types of locomotives in freight and passenger service. My opinion as to the propriety of the train mileage basis was made up before last night, when I saw this statement; I then knew the types of locomotives, but I did not look
293 into the details of their measurements until last night.

In weighting the freight side, I did not take into account the greater use of terminals by freight trains. I understood that most of these freight tracks were allocated to the freight service. That was not the basis on which I answered that I thought the revenue train mileage was proper. I took what information I had into account, and I understood that there were a greater number of tracks allocated to freight service; that is partly the reason I did not take into account the greater use of terminals by freight trains.

We have woods branches, used for switching, to run in and get freight cars, on L. S. & I., but do not run any trains on them. The expense of maintenance of those tracks should be borne by the traffic that passes over them directly. On trackage of this class, we make no train mileage; my idea is that the expense of maintenance of those should be borne by the freight service. I was not informed

of the amount of stational switching done by South Shore freight trains. I knew that this stational switching was done, although I did not know the amount of it. I did not take that into account; I took into account the movement of the trains on the main track.

Q. And that is the element that would weight the freight side, is it not; if there is a large amount of stational switching it would make the freight side of it to that extent more expensive? I am talking about maintenance?

A. These are kept in a separate account; that is, the repairs of the side tracks; they are not kept in the same account with the repairs of main tracks. I do not know whether the South Shore keeps them together.

294 Naturally, the stational work of freight trains would increase the maintenance cost slightly, but, aside from rail wear, I do not think it would be noticeable; your weather and wear cost go on just the same. So far as stational switching involves the use of the sidetracks, that did not enter into my division on the revenue train mile basis, as I presume the side track accounts were kept separately, and that their expense, where not used by passenger trains, was assigned to freight. The use of side tracks by freight trains, to allow passenger trains to pass, I attribute to the passenger trains, and that would weight the passenger side further than what I mentioned.

The locomotive movement of starting and stopping does not cause any wearing, unless the engine slips and burns the rails, which is inconsiderable. There may be greater stress in starting and stopping, but it does not seem to hurt the rail any unless the engine slips; slipping is more liable to occur on larger diameter driving wheels, like those used on passenger trains, than on an engine with more tractive power. There is more frequent starting and stopping in freight than in passenger service. I do not think there is any more wear at switches than in main tracks; there is no hammering on the frog, except going in on the side track, to take the sidetrack movement. There would be a little lurch in taking the sidetrack on a sidetrack movement; I don't think the increased wear by a train running on the main line is noticeable.

The only reason I can give why costs resulting from weather depreciation are to be divided on revenue train mile basis is because that is the unit of service; it is just the question of what is the proper method of dividing the cost that the running of the train has no effect upon. I do not think weather costs should be divided upon the relative time of use; in the first place, it would be

295 such a hard thing to compute, and it would be cumbersome. That is not the reason I did not use it; it is because I did not think it would be fair, or as good a way. I considered that, and thought of several things besides, but have not been able to arrive at anything that was practical, except this train mile basis.

These weather costs are here for the purpose of running trains; that is the reason that these costs are accrued.

Q. Yes, but when you get back of the whole thing, the trains are run to carry tons and passengers.

A. Yes.

Q. And when you apply the revenue train mileage basis to a division of weather cost, you are right in saying that it is an arbitrary basis, are you not?

A. Yes. I think any basis is arbitrary on those items.

Q. What expenses are incurred in producing the train movement, the actual movement of the train, that is, the propelling force of the train itself?

A. You mean the labor cost, and the fuel, water and roundhouse expenses?

Q. The roundhouse expense is not in the movement itself?

A. It is chargeable to it.

Q. It is the water and fuel and labor of the employes, is it not?

A. Yes, those are the forces that cause the train to move, and that cause the wear on the train itself.

Q. If the revenue train mileage is correct, shouldn't it approximate the wear on the train itself. Should not the wear on the tracks?

A. Oh, I don't think that has any relation whatever to the
296 other; I think that the wear on the train itself may be caused to some extent by the construction of the train, whether it is constructed to take care of that.

Q. That is the same thing that is true of the track, is it not?

A. Yes.

Q. That element would enter into both sides?

A. Well, the point I was trying to raise is that the things do not go together. The track might be constructed well and the train might not, or vice versa, so that the relation between the cost of maintaining your equipment and maintaining the track might not have anything to do with each other.

Q. And, other things being equal, assuming they were equally well constructed.

A. I would not want to say they would.

Q. Should not the wear produced by a force bear some relation to the force that produces the wear?

A. I don't think so.

Q. Why?

A. There are certain elements in a track, for instance, that wear in one place ten times as much as in the other produced by the same force that produces a less wearing in another place.

Q. True. But that same element in the track produces a wear back on the thing that runs over it?

A. No, there are lots of times in this particular case, a soft track would form a cushion and reduces the wear on the trains. That is very noticeable in years gone by, where tracks were built on muck dumps, making it very easy on rolling stock and very hard on the track.

I have not attempted to apply any other basis than the
297 revenue train mile basis; I considered several others, but did not attempt to apply them, as I gave them up as not being practicable—not fair to the service. I have never made any figures

based on a revenue train mileage basis of apportionment on any railroad. I did not study the accounts of the South Shore to determine it, but am familiar with those of L. S. & I. I have nothing to do with any accounts except the M. of W. & S., and with those I am familiar only on L. S. & I. I did not study them on the South Shore, and do not know what results would be produced.

As to how close the cost divided on the revenue train mile basis would be to actual cost, I do not think anybody could say what the actual cost is, except to devise some method of dividing it from their judgment and observation. I do not know how close the cost divided on revenue train mile basis would be from actual cost, except from observation.

Assuming the average number of cars per freight train on South Shore is 17, and it increases the number to 19, and thus decreases the freight train mileage, while the passenger mileage remains the same, I should still divide the weather cost the same as I did the other costs in any case, arbitrarily, on the revenue train mile basis. I do not think it would change the situation in any way regarding dividing it on a mileage basis; this is regardless of the fact that the company did the same business, with less car mileage, and that the factors of division were not factors which produced or affected the weather cost. That is because we have not in the item of weather cost any precise division, and that you must be arbitrary. The division on the other items would necessarily be the same, and I think those should be the same as the other.

298 YOUNG.

Redirect examination.

By Mr. Eldredge:

In answering Mr. Wykes, that the revenue train mile basis might not be absolutely correct, I meant it might not be absolutely correct in certain portions of certain items; in other words, certain portions of certain items might overrun and other portions underrun.

I think the question of delays to freight trains by precedence given passenger trains would enter into my judgment, but I did not speak of it because I was dealing only with M. of W. & S. costs. In my judgment, the revenue train mile basis would assign less of the cost to the passenger service than ought to be charged to it. I intended to say that, if there was any error, it was in the way of imposing costs on the freight traffic that ought to be borne by the passenger traffic.

I intended to say that the tracks in exclusive freight use were probably allocated to freight service alone, and did not come into this. We carry side tracks on L. S. & I. as a separate item, but don't separate between passenger and freight. The ore yards, for instance, I didn't think were included in the total of M. of W. & S. expenses.

I also had in mind track serving exclusive freight houses; as a matter of fact, I merely had that idea in mind, thinking that these particular tracks had been allocated on the appraisal of the property. I

don't know any way the cost of maintaining those could be gotten at, unless by changing the system of accounts and keeping them separately in the time books.

In the application of the revenue train mile basis in determining these maintenance charges, I think the exclusive ore and exclusive freight tracks in any large freight station ought to be ex-
299 cluded, before the method will correctly divide the expenses. If the passenger tracks and the freight tracks are approximately the same, neither one ought to be excluded.

I had in mind, when I said that (evidently referring to cross-examination), more especially the tracks used exclusively for iron ore. I do not know but what there are some places where you might have some exclusive freight tracks that are not offset by passenger tracks. As I think of it now, I don't think of any; in this town, there are probably more passenger tracks than freight tracks.

YOUNG.

Recross-examination.

By Mr. Wykes:

I did not have in mind, making this division, that these branches, such as traffic spurs, industry tracks, etc., over which no train mileage is made, were included in this maintenance. I thought they were and that they ought to be set apart to freight.

My Wykes: I wish to make a motion to strike out Mr. Young's testimony in entirety, because of making a division of expenses upon an arbitrary and a fanciful basis, not being an actual apportionment, and being out of line with what is permitted by the recent decisions of the United States Supreme Court.

YOUNG.

Redirect examination.

By Mr. Eldredge:

Since previously testifying, I have examined Complt.'s Ex. 1a, Riggs. I then stated it was my judgment that a division on
300 the revenue train mile basis would give a larger share of the burden to freight traffic than is absolutely fair, after excluding certain trackage I mentioned. I have gone over this exhibit, showing the lengths of the tracks, and have drawn off the tracks I intended in former testimony to exclude. I find on figuring the length of track that the amount of maintenance on them would be relatively so small that I am quite sure a division on revenue train mile basis would not only include this cost, but more, and, in fact, I think nearly enough to include all the branches, which I testified should be excluded.

I said all the branches and certain of the side tracks, in amount (now ascertained) 45.32 miles, should be excluded; an estimate of

maintenance on that amount of side tracks would be about $11,000 a year—a very small percentage of the total maintenance charge. I am sure that there is enough other costs to more than make up this difference. I estimate cost of maintaining side tracks as $250 a mile, that being the average cost of maintaining side tracks on L. S. & I., where the traffic is much heavier than it is on these tracks; $300 a mile for maintenance for industrial branches and $275 a mile for mine tracks, as fixed by Mr. Lytle, are, in my judgment, high.

I have a record of actual cost of maintaining some mine tracks in which South Shore owns an interest and of which it maintains a part; this cost, covering 4 years, averages $180.15 per mile, the highest cost being $360.38 and the lowest $30.45. The average of the two high years is $325.88; the two low years were years of evidently light traffic on these tracks. On M. M. & S. E., where we have kept similar tracks to the industrial tracks, our average maintenance cost for 1913 was $142, which was higher than two previous years, on account of more tie renewals.

The side tracks from which these figures were derived were our ore yard tracks, where we have our heaviest traffic; our ore cars
301 are higher center of gravity than most of the South Shore ore cars and the tonnage through these yards is pretty heavy. I am confident that the side tracks, as a whole, on the South Shore would not approximate the cost of these particular tracks. The ore tonnage is greater on the L. S. & I. than at the special yard at Presque Isle where all our iron ore passes through; the tonnage of ore on L. S. & I. this year was 2,250,000 tons.

YOUNG.

Recross-examination.

By Mr. Wykes:

Q. You have stated that in your judgment a larger proportion of the cost of maintenance of way is attributed to the freight traffic than is due to it, by the application of the revenue train mileage basis; can you express that in any figures, any percentage, or in anything other than as rests in your judgment?

A. No.

Q. And that depends on all of the features which you have stated, in former testimony, affect the two different sides of the problem.

A. Yes, that depends on those features.

Q. And it is simply your judgment that one would be a little heavier burdened than the other, with this method?

A. Based on experience, yes.

Q. And on the things you have testified to?

A. On the things I have testified to.

The mileage, 45.32 stated, was side tracks and exclusive ore tracks, not including branches. I did not know that there was any South Shore main line not used in passenger business; I did not take
302 that into consideration. I presumed, also, that the branches would be excluded, although I think they would be at least

partially covered by the difference I spoke of. The L. S. & I. cost of maintenance is variable; in 1913 our highest cost per mile of main line was $945.01, and our lowest, excluding a switching branch, which ran $211.88, was $323.49.

Our road (L. S. & I.) is divided into sections, the average cost for each being:

	1912.	1913.
Section 1, main track, Presque Isle ore yard, 1.37 miles (main track only)	$669.38	$914.01
Section 2, from section 1 toward Ishpeming, 5.52 miles	845.76	323.49
Section 3, west from section 2, 7.87 miles	335.01	490.61
Section 4, west from section 3, 6.2 miles	439.73	434.25
Section 5, south main line (not used for hauling trains)	292.23	194.46
Section 6, North Lake Mine Branch, 6.36 miles	211.88	179.23

I regard sections 1 to 5 inclusive as distinctly main line. Those include no expense of side track maintenance; we have that separate. The average per mile for side tracks, for the same period, was:

	1912.	1913.
Section 1, 13.37 miles (9.72 miles in 1912)	$243.02	$238.16
Section 2, .32 mile 1913, .5 mile in 1912	435.18	150.40
Section 3, 1.49 miles 1913, 1.50 miles 1912	121.82	203.21
Section 4, 7.08 miles 1913, 5.2 miles 1912	152.97	210.75
Section 6, 5.76 miles 1913, 5.87 miles 1912	346.09	601.20
Section 7, 3.65 miles 1913, 2.92 miles 1912	91.83	123.96

303 Section 1 is ore yard, with very heavy traffic; section 2 is ordinary side track; section 3, side track; section 4, there are some tracks called side track, used for loading ore; section 6, track composed almost entirely of yards for making up iron ore trains, and mining tracks, shifted for steam shovels; section 7, mining tracks, to mines not working in 1912.

On Section 7, and some on section 4, the tracks were so new that they needed very little tie renewals. I think the costs on the M. M. & S. E. would run a little lower; our costs on that road ran quite high this year; we did quite a good deal of work there, part of which is charged to operating.

There is a little higher center of gravity on all ore cars than in the ordinary merchandise freight cars. At high speed, the effect of this is detrimental to the tracks; at ordinary speed it has no noticeable effect. I presume that same thing would be true of a high loading of a freight car, raising the center of gravity; I presume it couldn't be to such a great extent as on an ore car, because the freight cars are so much longer that it would be impossible to get the load in it. Raising the center of gravity has the effect of exaggerating any bad spot in the track at high speed; the engine,

is the initial shock to the track, but if ore trains were run at high speed, it would make the track maintenance higher.

I have made no investigation to determine the effect of the continued vibration after the initial shock on track, more than to note the expense necessary to keep the track up. It must add to the rail wear, but I don't know that it would add materially to other costs; it might add to displacing ties and ballast. It has been our experience that it does not add to the creeping of ties.

304 YOUNG.

Redirect examination.

By Mr. Eldredge:

Trains are run on L. S. & I. only from Marquette to Ishpeming; there are only two short passenger trains, and they don't amount to much. The special maintenance in reference to passenger trains does not cut much figure on that part of our road. I wouldn't attempt to make any comparison between L. S. & I. and South Shore. I don't think it would be exactly fair to make comparison. Considerable money has been spent on L. S. & I. and charged to cost of line that materially reduces maintenance charge.

Section 4, is our new main track, and section 7 has no traffic to speak of—an occasional switch engine goes up there for ore, and last summer there was a passenger train twice a week.

(This witness was later called to testify before the Court.)

305 On July 19, 1912.

ERNEST J. DUBE, a Witness called by Plaintiff.

Direct examination.

By Mr. Eldredge:

I have resided at Houghton 28 years; in real estate business from 1888 to 1909. I was secretary and treasurer of Houghton County Loan & Investment Ass'n; I know value of real estate, Houghton and vicinity.

I know D. S. S. & A. property described in Complt.'s Ex. 1, Riggs, as Houghton Terminal, 12 acres, 1,550 feet of water front, with riparian rights, depth 150 to 350 feet; I estimate its worth at $35 to $40 a front foot.

(Map, Complt.'s Ex. 16, Riggs, showing property of D. S. S. & A. at Houghton, offered in evidence.)

DUBE.

Cross-examination.

By Mr. Wykes:

A piece of property within 500 feet west of terminal on water front sold within 18 months to Carroll Foundry. No other sales of water front property within a year or a year and a half. Within five years, there has been sold in this vicinity, a block of land where Amphidrome stands, a piece to Peninsula Wholesale Grocery Co., and another near and west of depot and terminal. Amphidrome is 200 feet back from water. The piece starts from water front. The Amphidrome Co. paid $100 a front foot for it with riparian rights. That piece was nearer the village than D. S. S. & A. towards the bridge, north and right back of main business part of city.

The piece sold to Carroll Foundry adjoins Carroll Foundry on east, runs back to Carroll St., and is 200 feet on the harbor line and 190 feet on the back. I was commissioned to sell this piece for $10,-
000. It sold for possibly $500 less. Principals made deal;
306 I don't know exact price. This piece lies closer to business part of town than the railroad property. It is only 300 feet from the old town, which is main business section. The terminal grounds are about 800 feet further east. The business center of the town is near intersection of Sheldon and Isle Royal Sts. This difference in location induced me to make difference in price. I added something because it was a large parcel, together, and the only available one for a large industry.

I am not sure it would be worth much less without the railroad on it. If the railroad were in the rear, all this would be more valuable, but lake frontage for business purposes, without railroad connection, wouldn't be worth very much. It would be worth much more than $50 a front foot if there were no railroad there, the property were all vacant, and it were wanted for railroad purposes.

On January 3, 1914.

DUBE, recalled by Plaintiff.

Direct examination.

By Mr. Eldredge:

I know the Mineral Range Station grounds at Houghton, shown on Complt.'s Ex. 16*a*, Riggs. It lies on the shore of Portage Lake between Is. Royal and Huron Sts., and averages about 440 feet deep along Isle Royal. It is block E and a part of block 4 in original plat of Houghton. In block 4 it is about 170 feet north and south from the Harbor line on the east, and about 115 feet on the west, side. I know its value for commercial purposes; it is $25,000, exclusive of improvements.

The right of way from east side of Ripley St. to west side of

Quincy St., not including that part of block E occupied as a depot and station ground, is 27,250 square feet, which I value at
307 75¢ a square foot., basing the value on the properties located each side of it. Between the west side of Franklin St. and east side of Ripley St., the right of way is 15 feet wide and 310 feet long, or 4,650 square feet, which I value at 35¢ a square foot, in the same way. The right of way from the South Shore terminal to the west side of Franklin St., 19,320 square feet, I value at 20¢ per square *feet*. It is my judgment that this narrow strip of right of way would be salable at present, assuming the railroad was not there, at $25,928. Assuming that the railroad was off, the people owning the adjoining property, Ripley to Quincy Sts., would be glad to buy this additional strip, to add to the properties they already own, and to pay this figure, in my judgment.

The Houghton people are seriously handicapped by not having a street on the lake front. We have a part of a street in the block, Franklin to Ripley, and no communication from that point to Quincy, so all the heavy traffic has to climb a hill and come on Sheldon, our best paved street, and the question has often been raised to acquire a street on the lake front, but, on account of extremely high price at which property is held, we have been unable to finance the proposition. If this right of way was vacated today and the village was privileged to buy it for 75¢ a square foot, it would be a quick transaction, in my judgment. Another reason for this value is that on each side of the right of way, between Ripley and Quincy Sts., is located the wholesale industry of Houghton. The Copper Range has purchased a right of way up to Quincy St.; (under objection as speculative) they are very auxious to come in, to serve these wholesale interests, and, if this right of way should be purchased by the Copper Range at 75¢ a square foot, there would be an opportunity to make some money, if I could purchase it at that price, and sell to them.

308 My opinion is, the ground lying north of the right of way, between Portage St. and the west end of the terminal, is more valuable than the terminal grounds. I am of the opinion that at the time the railroad came (1882 or 1883), this piece of ground from Portage St. toward the terminal was more valuable than the terminal property, as part of this was already platted, and several industries were already established on the lake shore adjoining the village plat, which plat was from Dacotah St. west to Franklin St.

309 On July 19, 1912.

WILLIAM D. CALVERLEY, a Witness called by Plaintiff.

Direct examination.

By Mr. Eldredge:

I first came to Houghton in 1860; have lived there continuously since 1881. I have been connected with a real estate firm there most

of the time since 1881, first as bookkeeper, and later as member of a corporation made up of large real estate owners. I have dealt in lands a great deal, buying and selling, both representing the corporation and myself. I own real estate in both business and residence portions, and know value of real estate in Houghton.

I know the property described in Complt.'s Ex. 1, Riggs, as Houghton Terminal, 12 acres, 1,550 feet of water front, depth 150 to 350 feet, and consider it worth $40 to $50 a front foot; I would prefer to call it $50.

CALVERLEY.

Cross-examination.

By Mr. Wykes:

Values have increased very materially recently in the section around Houghton to Chassel.

The Carroll tract, of which Mr. Dube spoke, is west of the terminal, adjoining, on the west, Crow's property, which is west of the building on Complt.'s Ex. 16, marked "office."

The center of business section is 1,000 feet farther west than the Carroll tract; terminal is east of Carroll tract. Carroll tract runs back 400 or 500 feet from Lake front. The land there has not been platted; is sold by metes and bounds. I don't know the front foot sale price of Carroll tract. The Amphidrome parcel is still further towards the business section than the Carroll tract.

310 CALVERLEY.

Redirect examination.

By Mr. Eldredge:

The Amphidrome property, costing the Amphidrome Co. $25,000, practically $100 a foot, is not nearly so deep as railway company's property. The present value of the Amphidrome property, exclusive of buildings, is at least 10%, possibly 25%, more than we paid for it. The sale was 10 or 12 years ago; value has changed since. On dock property, it has not enhanced materially, because boat companies have agreed only to deliver to one dock in a town, but, generally, growth of city would make it worth more.

The South Shore road, on the 63 acres east of School of Mines, runs a few rods from Portage Lake. The property on bluff sloping down to lake is the valuable property. It isn't possible for the railroad to run through best property, as the railroad lies down on the level. It is the right to the water front that adds largely to the value; to some extent, the railroad interferes with that here, because, running so close to the water front, there isn't room between it and the water front. So, between railroad and lake, generally, railroad decreases the value of the property very much. If there were sufficient room for cottages between railroad and lake, land there would be readily salable at much larger prices than I have named.

CALVERLEY.

Recross-examination.

By Mr. Wykes:

The quantity of water front property on the market at Houghton is limited, and the price is affected thereby. If ½ or ¼ of
311 the water front at Houghton were thrown on the market, there wouldn't be any ready sale for it at prices I have named.

CALVERLEY.

Redirect examination.

By Mr. Eldredge:

It certainly would be difficult to sell, if half or a quarter were thrown on the market at one time. That doesn't affect my judgment of present value, as that condition isn't likely to occur.

312 On August 26, 1912.

WILLIAM P. BELDEN, a Witness called by Plaintiff.

Direct examination.

By Mr. Eldredge:

I am 39 years old now, and reside at Ishpeming; previously at Grand Rapids. I have been an attorney for 17 years; was the local attorney for Michigan Central Ry. three years; have had experience in acquirement of right of way for railways, public service companies, and power plants, in Upper and Lower Peninsulas.

Near Grand Rapids, in Lower Peninsula, we paid two to four times the ordinary acreage value of land, to secure a right of way across a forty or other description of land. Same thing is true of Upper Peninsula. I have acquired at least 25 miles of right of way for all classes of corporations, 5 miles in the Lower, and 20 miles in the Upper Peninsula.

I remember the L. S. & I. acquiring right of way in Marquette county, from the C. & N. W. The land was sand plains, without cultivation or improvement; value was in no way affected by possibility of minerals. The price was $25 per acre. We got at least two miles of sand plains from C. & N. W., by purchase. We condemned a right of way on one forty, and possibly two, of same character, belonging to a private party, and paid $30 an acre for it. The character of that land was the same as land from Chocolay, on South Shore, to Sand River. As a result of that experience, Cleveland Cliffs Co. adopted the policy of fixing $25 an acre for railroad right of way, to all railroads, across lands of that character; to this $25, minimum, we add timber value, if any. This, I believe, is cheaper than the land can be acquired by condemnation.

I have been interested in purchase of many pieces of land in Negaunee and Ishpeming; and I know the value of lands
313 there, generally. I know the right of way of South Shore within corporate limits of Negaunee, known as the north line, as well as the new line of 2.6 miles near Negaunee mine. I also know south line, which extends from a point in the N. E. ¼ of S. E. ¼ of section 34, 48-26, to beyond limits of Negaunee east. In my judgment, a fair average price on that right of way for total of 86 acres, described on Complt.'s Ex. 8, Riggs, as mile post 163 to mile post 164, plus 2,800 feet, the 2.6 miles of new line, and mile post 9 to mile post 12, of the south line, would be $2,500 per acre, possibly more. I have paid more and less for land in that locality.

I had charge of negotiations for the 2.6 miles. From mile post 163 to mile post 164, plus 2,800 feet, the value of the land is at least $2,500 per acre. The value of the land of the new line, 2.6 miles, is $5,000 an acre or more, beyond question. The value of land, mile post 9 to mile post 12, south line, called the Marquette and Western, which crosses section 33, is $2,500 to $3,000 an acre.

We had to pay, through condemnation or purchase, the prices mentioned, or higher. On this 2.6 miles of new track, we paid $5,000 an acre for surface value alone, entering into a contract guaranteeing fee owners against loss from ore, which could not be mined because the land was burdened with railroad track. That was across N. E. ¼ of N. E. ¼, N. W. ¼ of N. E. ¼, S. W. ¼ of N. E. ¼, Sec. 5, T. 47 N., R. 26, W. From that point, and following the new right of way across the balance of section 5, and that part of section 6 occupied by the Maas, Lonsdorf and Mitchell Add., we paid $5,000 an acre for right of way, and located it, when possible, where ore was not likely to be found; i. e., on the rocks, where rocks could be located. The mineral rights are reserved, but mining operations cannot interrupt or interfere with safe operation of the railroad, which got a permanent non-caving right of way.

314 The right of way of South Shore across this entire stretch of land is permanent non-caving. We paid $5,000 an acre for it, and contracted to indemnify owners for loss through ore which had to be left in pillars underneath tracks. If ore is discovered, its quantity must be determined, and Cleveland Cliffs Co. will pay its fair value in the ground. I will produce a copy of that contract. South Shore right of way all through here is permanent, and cannot be destroyed by mining operations. Very few such rights of way are acquired.

Here is a map showing the Maas and Negaunee mines, and the old main line of South Shore crossing between the two. The ore body extends practically continuously from Negaunee mine across to Maas mine, going beneath the railroad tracks; there is a sandy formation which cannot be mined without caving the surface. To release the ore, the Cleveland Cliffs Co. contracted with South Shore to secure a new right of way, approved by its engineer, and to build tracks and fence, set up telegraph poles, and make it in every way ready for use, and South Shore was to abandon old right of way and quit claim to

us. The South Shore was only to abandon a definite portion covering exposed mineral body in Negaunee.

I think right of way from center of section 6, near end of old line, to mile post 167, on Complt.'s Ex. 8, Riggs, worth over $5,000 per acre, as it runs through the heart of town; I should say $6,000 or $7,000 per acre, without reference to minerals. I believe the value of 8,700 feet track rights, which is the track paralleling C. & N. W., commencing at mile post 167 and extending to limits of Ishpeming, known as the north line, is $7,000 or $8,000 an acre. Considering the title of South Shore, you couldn't buy a right of way across there for $7,500 an acre.

315 The deeds are not necessarily all alike, but mineral is reserved and might be removed, but in such manner as not to interrupt and interfere with safe operation of the railroad. The bond to property owners runs from Cleveland Cliffs Iron Co. to Pioneer and Arctic, to indemnify them for ore lost through being obliged to maintain the surface. This is only in case of Pioneer and Arctic company, and doesn't apply to all of them.

(Mr. Eldredge reads in evidence the mineral reservations of a deed to 8,700 feet, from Jackson Iron Co., consideration, $1, dated March 17, 1885.) This deed contains no provision as to who shall bear expense of moving track, nor for connection at either end. The Marquette and Western deed has latter provision. The quantity of the estate granted in the deed read was a right of way, an easement—not a fee. The Jackson Iron Co. has the land, so that it could grant a right of way without additional purchase, as it has never parted with its mineral rights to section 1, and only a small part of the surface.

The valuations I have given cover the naked land value, without improvements.

I know right of way of South Shore known as Teal Lake branch, extending from main line near gas plant of Jackson Iron Co. property to mines on Teal Lake. It crosses land of probable mining value all the way; Riggs' valuation of $1.50 per lineal foot for 7,300 feet is fair.

I know the right of way of South Shore to Milwaukee Mine, 13,680 feet in length, and believe Riggs' value of $1.50 per lineal foot fair. I think those rights of way would cost more today.

Considering 12 acres to the mile, I believe the value of south line of South Shore, which is old M. H. & O. line, and which
316 crosses the Jackson Iron Co. and Cleveland Iron Co. lands and follows the L. S. & I., to be $3,500 an acre.

(Mr. Eldredge states deeds to M. H. & O. right of way are straight conveyances, with no question of trackage rights or conditions involved, except reservation of the mineral, and produced deed from Cleveland Cliffs Iron Co., dated June 16, 1871, which he read into the record; he also produced and read deed from Cleveland Iron Mining Co. to the Iron Mountain Co. dated June 3, 1857.)

I know south line of South Shore in Ishpeming, west from that concerning which I have just testified. It contains 38.2 acres, and runs through a section of the city available for business purposes.

I believe it worth $3,500 to $5,000 per acre. I know north line in Ishpeming, and believe it worth $7,500 an acre through the center of town.

I would place an average valuation of $5,000 an acre upon that strip extending to limits of Ishpeming, both east and west, covering the business section of the town and from the East New York mine until you get out beyond the present Cliff shaft. I am considering the kind of right of way the South Shore has. If a railroad company were willing to take a right of way from which the mining company could compel it to move, on notice, it could get it for less. The prices I have named represent the actual value of surface rights, such as South Shore has, but you could not buy for that price.

Here, mineral rights are reserved but the railroad rights are predominant. (Witness illustrates, by relating failure of Pioneer Iron Co. to reserve right to compel removal of tracks when deed was made to the Iron Mountain Railroad in 1857, which failure, he says, cost the Cleveland Cliffs Iron Co. several hundred thousand dollars
317 in building a new line of 2.6 miles and trading that for the old.) Such experience demonstrates the great value of permanent rights of way, which could only be procured today at prohibitory prices.

(Mr. Eldredge states that 5,000 lineal feet right of way through the heart of the business part of the city has been excluded from the last testimony of witness.)

I would put a valuation of $3,500 an acre on the strip of land extending from Union Park to a short distance west of mile post 169 on north line, as it is vacant land. I would put about the same valuation on that strip west of the heart of the town, extending from Cliff shaft to Winthrop Junction.

(Mr. Eldredge here read into record deed from Excelsior Iron Co. to Marquette and Western Railroad Co., dated 26th of November, 1886.)

I would say that that section of a mile or so extending through the heart of Ishpeming from the gas plant on the east, out to Cliff shaft mine on the west, is worth at least $12,000 per acre, on the theory of six lots to the acre, since this strip is lined by buildings used for business purposes. This averages $2,000 per lot. I feel certain a right of way like this could not now be purchased for Riggs' valuation of $150,000.

I believe the 23 acres in Winthrop branch of South Shore worth $2,500 an acre; an average price for right of way of Palmer Branch, to the Palmer mine, is $2,500 to $3,000 an acre.

The value of the 3.2 acres right of way of Mary Charlotte branch, bought of the Cleveland Cliffs Iron Co. with a removal clause
318 on 9 months' notice, is, in my opinion, $3,500 an acre; we paid $5,000 an acre for one similar.

(Mr. Eldredge produced deed dated Nov. 15, 1910, from Iron Cliffs Co. and South Shore for 3 strips of land. He stated it contains

most unfavorable reservation clause of all, to effect that if grantor cares to use right of way granted, for mining purposes, it shall give grantee 9 months' notice, and if grantee fails to remove tracks grantor may remove and charge expense to grantee. Also, after such notice, grantor shall not be liable for damage to any property, and shall be saved harmless by grantee, if latter does not remove tracks.)

I consider that branch profitable enough to justify paying $3,500 per acre for right of way; it hauls lots of ore, and will for years. In fixing that price, I took into consideration that much of the land in that vicinity has been entirely withdrawn from the market by mining companies, that they will neither sell nor lease, that land in the vicinity of the city commands a very high price, and that we have paid for our railroad as high as $5,000 an acre.

I am not sufficiently familiar with land west of Ishpeming limits to put a price on it. We bought right of way for L. S. & I. as far west as Joplin, up in North Lake district. We paid the value of the land plus timber value, with the proviso that the grantor can put us off on 9 moonths' notice.

I think the value of main track from Winthrop Junction west, which connects the two main tracks and is called "the horn" (1,000 feet in length), is about $3,500 an acre.

319 BELDEN.

Cross-examination.

By Mr. Wykes:

The line of L. S. & I. to Joplin was acquired under my general supervision within last year or two; the titles obtained were similiar to that in last deed Mr. Eldredge read, providing for removal at option of mining company at a stated period at expense of railway; I think but one deed without that provision. We paid about the surface values there. The land is not exactly agricultural land; there are some farms out there. I don't suppose that land worth over $25 an acre, but this crosses mineral district, and to purchase permanent right of way I feel certain would require from $2,500 up, because of possible damage to mining operations. There is a vast difference in acquiring these rights of way, as to the quality of rights of way you want to get.

An important element would be the fact that they are not permanent; yet, in city rights of way around Ishpeming and Negaunee, the land has an actual surface value in the market at prices approximating those mentioned. When I spoke of $2,000 an acre in Ishpeming, I meant a lot, say, 6 lots to acre; that is a very moderate commercial value of that land aside from railroad purposes. Add to that, excess cost for railroad purposes, and you would get amounts approximating what Mr. Riggs had. In my experience, we have to pay several times the commercial value of land, to get it for right of way purposes.

When you go through towns, procuring rights of way, cutting across city property, the owners always insist that the location of railroad track in the vicinity of their property is of itself an element of damage, and they raise the price accordingly. I cannot lay down an exact rule, but we have had to pay 2 or 3 times ordinary
320 value, even in cities—right in Negaunee—both by condemnation and by purchase.

The clause in a deed requiring railroad company to remove tracks at option of grantor would be a distinct disadvantage to railroad company, regardless of whether in city or some other mining locality, as removal might cause very large expenditures, and it is almost impossible for railroad to get new rights of way through that district. There are extensive mining operations carried on in vicinity of these cities; they are mining underneath Ishpeming.

The Cleveland Cliffs Co. controls Iron Cliffs Co. I had charge of sale, by the latter to South Shore, of right of way of Mary Charlotte Mine; transfer one of considerations for inducing South Shore to give up old rights of way and consent to removal of their tracks to new right of way. We purchased, built and equipped 2.6 miles of new right of way for them, besides furnishing this, and at least one other, right of way deed.

The values I placed, ranging up to $12,000 an acre, were not entirely based on idea that title of South Shore did not require removal of track at sole option of mining company at railway company expense. I considered permanent right of way of greater value than one which could readily be removed, but have learned that lands through Ishpeming and Negaunee command a high price for market purposes. The purchases I have in mind are purchases for surface rights for mining companies. The mining companies platted and sold lots on the surface, and the deeds drawn in light of experience of mining lawyers of that time did not contain caving clause. Now, all sales reserve right to cave the surface, if necessary, for mining purposes. We paid very high prices for surface rights containing those reservations. That varies considerably with the location
321 and structures on the land. The mining company has no right to condemn for caving rights, and there is no way for it to acquire, except by purchase.

In Forsythe Township, Marquette County, in Gwinn district, the Munising Railway Co., to reach certain new lines, including one on Sec. 35, condemned lands, securing an award of about $30 an acre; the expense increased the cost to over $300. That was in district where we were paying $25 an acre to C. & N. W. The ownership of lands in the locality where these condemnations were made, was not in the mining companies as generally as in the Ishpeming and Negaunee district at that time. Since that time, the Cleveland Cliffs has fixed a policy of $25 an acre, plus timber value, in sales for railway purposes.

In line, mile post 163 to mile post 164, plus 2,800 feet, I fixed a value of $2,500 an acre, average; some was purchased below, and some above, that price. Across the same sections, I condemned a right of way, a year or two ago, and across this very tract leading to

our Negaunee mine. In the condemnation proceeding, becoming apprehensive that we were not going to get the track at all, because of possible value for mineral purposes, I filed a waiver of rights against the mineral estate, and stipulated that if mineral was found, and mining operations required, we would remove the track at our expense; that waiver was subsequently ratified by our board of directors, and I then got a verdict at from $1,000 to $3,000 an acre for that right of way. We crossed the Barassa, Marketti, and Martell parcels. They were owners of land lying east of Negaunee mine, in a region where existence of ore was uncertain. The mining companies have had options on some of that land, which were abandoned; yet it is possible mineral region. The attorneys for defendants pressed the value of the property for minerals pretty strong.

322 and raised the question of validity of the waiver, but I told the jury it would be ratified by our company, and they evidently relied on that.

Opposing counsel made the claim that the waiver would not accomplish what I claimed for it, and that it was not binding; that point was presented to the jury, and there was no decision upon it by any authority except so far as it entered into the jury's determination. I was afterwards told by two or three jurors that if we had not done that we would not have gotten the verdict. The highest price paid in this condemnation proceeding was along this piece of tract I am asked about. I paid $300, with a removal clause, across a forty near there for the L. S. & I.; I think that was the lowest price.

The lowest price paid without a removal clause was where we paid the Pioneer and Arctic Iron Co. $5,000 an acre on new 2.6 miles right of way, and Cleveland Cliffs entered into a contract agreeing to indemnify Iron Co. from all loss of ore, if ore was found, which might have to be left as pillars to sustain the track. I don't think we have bought or condemned any right of way in locality of Barasso tract except that had removal clause; all our rights of way had removal clause except this South Shore track, and I would think the lowest we paid there was about $1,000 an acre; that was by condemnation, and was the Martel tract. I have in mind that the South Shore has a permanent right of way through there; it gives it a greater value than these other rights of way with removal clause.

I believe land owners there would be glad to pay $2,500 an acre, or more, if South Shore would exchange its rights of way to one which would permit a removal whenever mining operations required it. The removal clause does not cut much figure unless in ore district.

Where South Shore track is, is a possible ore district. It is

323 difficult to say where eastern boundary of ore basin is; it may not extend that far east.

Q. In your condemnation proceeding, in which you condemned the Martel, the Marketti, and the Barassa tracts, as you have stated, wasn't there an attempt in that proceeding to indicate the ownership of most of the lands in the locality by the Cleveland Cliffs and the associated companies, and the fact that those companies would not sell under certain prices, which were very high?

A. Yes, they attempted to show that; they attempted to show a good many things in that case.

Q. The jury was somewhat influenced by the fact, was it not, that the L. S. & I., which was a constituent company of the Cleveland Cliffs, was purchasing that property:

A. I don't think so. I think in the end, as soon as they got by the question that they were possibly tying up any material value there was in these lands, they then sat down and figured out what they thought was the fair value of the land exclusive of the mineral element.

Q. But that influence was urged upon the jury by the attorneys in that case, both by the questions and by argument, was it not?

A. They urged it.

Q. And very strongly.

A. Well, I didn't think so. I thought it was a good deal of a bluff.

Q. In that proceeding, didn't certain of the witnesses testify to values there of $100 an acre for the lands that you were about to take—certain witnesses for the railroad company?

A. Well, I don't remember; we offered proof tending to show a very much lower value than the jury awarded, and I don't recall now just what those figures were. I haven't looked up my notes.

Q. Who were the witnesses.

324 A. Well, let me see, we called, as I remember, Mr. E. C. Cooley, of Ishpeming, and I think we had Mr. Asire of Marquette, two that I have in mind, outside of any connection with our own people. I think those were our two principal witnesses on value, outside of questions I asked our own men.

Q. Were the records of the proceedings taken down?

A. Oh, yes.

Q. Transcribed?

A. Yes, they were never written up because there was no appeal taken. We paid the judgment, and the other side did not appeal.

Q. Isn't it a fact that in that proceeding Mr. Townsend testified to a value for those lands of $100 per acre?

A. Well, now, I don't remember what value Mr. Townsend put on them; I know it was a great deal lower than the jury awarded.

Q. Do you remember what value Mr. Cooley put?

A. Well, I started out to prove in those proceedings a valuation of a $100 to $125 an acre, or something like that, and I might say frankly that I thought these figures that I am giving you when I first began to have to pay them were pretty high—that they were in the nature of hold-ups. But when I found that all other railroad companies were paying the same, and that those values generally prevailed, I made up my mind that perhaps I was wrong.

Q. You started out with the idea that was worth about $125 an acre?

A. Something like that; I thought these prices were too high. I thought so, and I went out and contested several condemnation cases around Negaunee, on the theory that we were being held up, and when I found these different jurors giving these prices, and

other people paying them, I made up my mind that my judgment was wrong.

325 Q. Didn't you fix your idea of $125 an acre from the fact that in that immediate vicinity, and in the same year of your condemnation proceeding, your company had purchased lands at a hundred dollars an acre?

A. We attempted to show that the prices we paid a mile or so away from there ought to be governing here, but we didn't take into consideration certain facts that these men showed at the trial, and that is that this was a flat, level region in the vicinity of these new mines which are being opened now at Negaunee and furnish really the only available building site for the new homes that will have to go up in Negaunee, and that is the way they made their——

Q. (Interrupting.) Wasn't that rather proven in the Collins case than in this case?

A. Both cases. The Collins' is in a different part of town. They are now being opened up. There are two new shafts being sunk, one at the Lucky Star mine, and one at the Breitung Hematite mine, and plans are being made for a third one at the Athens mine, all within a comparatively short distance of this territory. That will mean the employment of hundreds of more men in Negaunee, and those people have got to have some place to live, and, in that case, Mr. Barassa, who tried the case for his father, Mr. B. F. Barassa of Chicago, offered proof tending to show the volue of this property for building lots, and that is the way he demonstrated its value and got his high verdict.

Q. The condemnation proceedings that you have had have all been for the Cleveland Cliffs or its constituent companies?

A. Have all been for the Lake Superior & Ishpeming Railway and the Munising Railway Companies. I think I also began one for the Marquette & Southeastern. Those are all companies owned and controlled by the Cleveland Cliffs Iron Company.

326 In fixing $2,500 as an average price, I considered number of sales at lower and at higher prices. City of Negaunee condemned N. W. ¼ of Sec. 33, T. 48 N., R. 26 W., for cemetery. It lies north of east end of new south track, 2.6 miles long. I finally paid $300 an acre for it, after being asked $450.

I did not consider this 40 acre tract as being $3,000 per acre, in arriving at $2,500 valuation. We used about 25 acres of the 40. It was the N. W. ¼ of N. E. ¼ of Sec. 33. The deed reserved minerals. I have not made computation to get at this $2,500 valuation, but base it upon various transactions I have made, considering both worth and cost; in other words, what it would command in market. I have had in mind also right of way we condemned for L. S. & I. on the N. W. ¼ of S. W. ¼ of Sec. 33, the E. ½ of S. E. ¼ of Sec. 32, and the S. W. ¼ of S. E. ¼ of Sec. 32, T. 48 N., R. 26 W.

We condemned lands of 3 owners, the Barassa, Marketti, and Martel families, and purchased from South Shore Land Co. We paid about $3,000 to Barassa and $1,000 to Martel people. I don't remember the prices paid South Shore Land Co. There was no other condemnation or purchase on that line. I have also purchased

flowage rights in this section, and right of way for L. S. & I. north of and only a few hundred yards away. For this last I only paid $300, but we claimed that this seller had no title, and won in the lower court, but thought it safer to buy what title he claimed.

I have also in mind purchases of part of new South Shore main line, starting from mile post 164. All these rights I have mentioned are temporary, and must be moved for mining operations. I have had only three condemnation suits in this vicinity of Ishpeming and Negaunne, none in other counties. We have been talking about the spur extending from north line of the L. S. & I. road,
327 which runs through the Collins tract over to Negaunee mine. I also condemned some rights of way for line through Collins tract. On that part of the line, from Maas mine west past Teal Lake, and over to main line of L. S. & I. west of Negaunee, most of land was acquired from subsidiary companies of C. C. I. Co.

Purchase price and kind of conveyance have never been fixed on deals with those companies. They owned fee, while owner in Collins tract only had surface rights, and mineral estate would control railroad operations. In lots in that tract, values were affected by presence of houses.

Main line, where I have fixed value at $5,000 an acre, was purchased before Barassa and Collins condemnations. Deal was completed Nov. 10, 1908; Negaunee mine owners acted as unit. Two men fixed the prices for them at $5,000 across part of Negaunee mine property known on my map as Maas, Lonsdorf and Mitchell Add. Addition lies in S. E. ¼ of Sec. 6 and S. W. ¼ of S. W. ¼ of Sec. 5, T. 47 N., R. 26 W. There was 5.22 acres in that portion of right of way that was fixed at $30,000 and paid in cash. Balance of right of way across east end of Negaunee mine property, from addition to east end of property, containing 3.20 acres, was adjusted in general transaction, on theory that $5,000 an acre would be paid for it. Title to 5.22 acres was held by Lonsdorf, Maas, and Mitchell families. Three men originally owned in common, but they are dead, and ownership is broken up.

Fee owners have leased mine to C. C. I. Co., which has transferred lease to Michigan corporation called Negaunee mine, which is owned partly by C. C. I. Co. and partly by Lackawanna Steel Co. Geo. J. Maas and Geo. Lonsdorf were committee for fee owners, none of whom are stockholders in C. C. I. Co. or Negaunee mine. Deal was approved by owners of both fee and lease before title passed.
328 Lease holder had nothing to do with fixing price. Negaunee mine was benefited by removal of track, which interfered with its operations, and will pay a portion of the cost. Leaseholder got none of consideration. Expense of removal was apportioned between Negaunee mine, Maas mine, one-half of which is olso owned by C. C. I. Co., American Mining Co., a subsidiary of steel corporation, and Cleveland Iron Mining Co., a subsidiary of C. C. I. Co. Negaunee mine was only interested in getting best bargain, as it was paying part of price.

The 10.96 acres acquired of Arctic and Pioneer Iron Companies is situated as follows: .11 of an acre in N. W. ¼ of N. W. ¼ of Sec. 4-47-26, 3.95 acres across N. E. ¼ of N. E. ¼ of Sec. 5, 2.45 acres in N. W.

¼ of N. E. ¼ of Sec. 5, and 2.05 acres in S. W. ¼ of N. E. ¼ of Sec. 5, all in same township. The other parcel, 2.30 acres, is west of the Maas, Lonsdorf & Mitchell Add.; in Sec. 6, extending across S. W. ¼ of N. E. ¼ of Sec. 6. There is also .15 of an acre in N. W. ¼ of S. W. ¼ of Sec. 6.

Of parcels in section 6, Pioneer Iron Co. owns surface estate and one-half mineral estate, while other half of mineral estate is owned by Arctic Iron Co. Other parcels in Sections 4 and 5 are owned by these companies jointly, each having undivided half interest in both estates. One-half of Arctic Iron Co. is owned by Breitung-Kaufman interests, who set price on this land, while Cleveland Cliffs interest, which owned Pioneer Iron Co. and one-half Arctic Iron Co., sought of it lies in same section with Martel land. I don't remember exact for ore under tracks.

Cemetery land, purchased for $300 an acre, is in N. W. ¼ of N. E. ¼ of Sec. 33, north of mile post 164, on Complt.'s Ex. 1. Some of it lies in same section with Martel land. I don't remember exact price paid for latter. Price through here was $5,000, too,
329 fixed by Mr. Kaufman with reference to value for building lots on account of opening new mines. Three new mines, the Lucky Star, Athens and new Breitung-Hematite, are soon to be opened in this vicinity, to employ many men, and this right of way was most available for buildings.

About 10 acres purchased was from Maas, Lonsdorf & Mitchell estates; $30,000 was paid for 5.22 acres. Mr. Townsend was not quite right on consideration, but was right on area, when he said $30,000 was paid for 8.93 acres.

There were several matters adjusted in this general transaction. Lease held by Negaunee mine didn't assure it right to cave land, and we wanted that fixed. Furthermore, fee owners claimed that right of way to be abandoned would revert to them as abutting owners. We adjusted these matters, and got new right of way, by paying $30,000 for privilege of amending lease, $30,000 for new right of way, and $26,475 as advance payment on royalties to be allowed fee owners for abandonment of claim of reversion. All told, they got $86,475, but I have only considered that we paid $5,000 an acre for this right of way.

This was all one general deal, and it is difficult to say how much was paid for any item. I have always thought we paid more than $5,000 an acre for this land. $5,000 an acre was adopted for several other parcels, excluding those purchased from two iron companies and Maas, Mitchell & Lonsdorf estates. One parcel, owned by Iron Cliffs Co., in S. E. ¼ of S. W. ¼ of Sec. 33, went in at $5,000, as they thought they ought to have as much as others. Expense was to be reapportioned to subsidiary companies by C. C. I. Co.

Parcel in Sec. 33, last mentioned, was in third forty south of cemetery land. Surface estate owned by Maloney, and mineral by Seager and Smith people. We paid Maloney $3,500 for four
330 acres across his land. His parcel adjoins description in which Iron Cliffs Co. was allowed $5,000. We had to get two deeds, one from surface and one from mineral owners. I don't remember

what we paid the Seager and Smith interests. There was also parcel (1.70 acres) crossing N. W. ¼ of S. E. ¼ of Sec. 33, owned by Burt heirs. That was on extreme east end, and price was lower and brings down average.

Of another piece, N. E. ¼ of S. W. ¼ of Sec. 33, surface was owned by Martel heirs, and mineral right by the Seager and Smith interests. I don't remember what we paid for either. It is east of the ore basin, although eastern line of basin is very uncertain.

I have now taken all that right of way, and only contract to indemnify owner was given to Pioneer and Arctic Companies. Prices which were fixed when Cleveland Cliffs interests were represented on both sides were influenced by verdicts in Collins condemnation case. Prices allowed in suit were much higher than we thought land was worth. Connection of the L. S. & I. and C. C. I. Co. was shown in Collins case.

It was shown that C. C. I. Co. and constituent companies held large acreages not for sale at all, or at very high prices. It was also shown that this was the only feasible right of way through Negaunee. I don't think jury was prejudiced by attempted showing that land was wanted by a railroad controlled by C. C. I. Co. I now believe award was about right. We paid award, plus all costs and attorneys' fees.

I have made no purchase near Winthrop branch, but have been over it, and know situation through handling leases and contract between C. & N. W., Lake Superior Iron Co. and L. S. & I. My judgment on value of that right of way is based on my general experiences in Ishpeming and Negaunee district.

331 As to Palmer branch, I bought right of way for L. S. & I., running south and parallel with it, out to Rolling Mill mine. We crossed some land owned by the Breitung-Kaufman interests, and also some Pioneer and Arctic, and they charged us $6,000 an acre, with privilege of requiring removal of track. On Complt 's Ex. 8, Riggs, their tracks to rolling mill start from old main line of L. S. & I., on N. E. ¼ of N. E. ¼ of Sec. 7, and extend to S. E. ¼ of same section.

We went across land of Negaunee Iron Co., which is owned by Breitung-Kaufman people, and had to pay $5,000 an acre for it, on the theory that it was available for building purposes. All land purchased there was from them.

The original main line of L. S. & I. across south side of Negaunee runs by Queen mine, in S. E. ¼ of Sec. 5, and our deed required us to remove the track. Regent Mining Co., occupying Queen group, notified L. S. & I., and we had to build new main line from Maas mine west, by Teal lake, connecting with our main line at Negaunee.

BELDEN.

Redirect examination.

By Mr. Eldredge:

Character of ore mined under my house at Ishpeming is different from that in Negaunee basin and that on south side of Ishpeming.

It comes out in hard chunks, like coal, instead of like dirt. Even in this hard ore, it is necessary to leave large quantities of ore, in pillars, to support the surface. Soft ore mines at Ishpeming and Negaunee are operated extensively on caving system, which means that slice of ore is taken out and support then moved, so that the ground above the surface may cave in; then another slice is taken out and again caved in, etc. This is safer for men, and cheaper.

332 Whole workings and surface go down in this way gradually. In south Ishpeming, where old workings of hard ore are, they take pillar out after ore is out of the bottom, and surface is likely to cave. You can see large openings near the railroads and all around Ishpeming. Under my house, the South Shore tracks and town, they leave large pillars, even though they are 500 feet down. Ground between South Shore tracks and C. & N. W. tracks in Ishpeming, to which ordinance provides for removal, is quite level, and cost of removal would be light.

Cleveland Cliffs Iron Co. owns and controls about 2/3 of the stock of L. S. & I., and not all, as previously inferred. Other 1/3 is owned by Jones and Laughlin Iron Co., of Pittsburg, so all dealings are same as though strangers. Same care is used to make all deals between C. C. I. Co. and subsidiary companies just and fair. C. C. I. Co. would charge L. S. & I. same for land as any other Railway.

By known ore bodies, I mean sections where operations have been carried on and ore is located. Until operations have been carried on, no one knows of ore bodies, for certain.

By Pioneer and Arctic contracts, ore not only has to be left immediately beneath tracks, but far enough out on either side of the right of way to support it. If workings were 800 feet deep, you would have to stop mining operations at 400 feet from right of way line; the rule is that ore will cave at such an angle as will take a strip about one-half depth of operations.

Operations in Negaunee mine are about 800 feet deep. We have drilled holes at the Athens Mining property from 1,200 to 2,000 feet down; new shaft at Negaunee mine is about 700 feet.

333 I think price of $5,000 for their land is fair. In the Arctic and Pioneer tracts, fee owners know that three new mines would increase population of Negaunee, and that these lots would be available for building. I finally agreed with them. Mr. Kaufman took the position that indemnity from C. C. I. Co. might not be good in future, as company might lose standing. He only consented to railway there at all as an accomodation, and only wanted fair price.

Costs of purchasing land for right of way is very heavy—counsel fees, traveling expenses, gathering data and information, and dealing several times with people through different agents.

I think owners of easterly portion of this tract, who lived away from here, received the fair value of their holdings. People differ as to future of a country, but we dealt with men capable of taking care of themselves. At heavy expense, we hired lawyers in California, sent one from Seattle to Canada, and another on a long cir-

cuit to get those papers signed. The land at the easterly end of the tract, Eagle Mills, is not worth nearly so much as nearer the settled portion of Negaunee.

Cleveland Cliffs Iron Co. was offering land on lease in Negaunee, subject only to mineral right. No mining company will lease without that reservation. Known mineral body extends under settled portion of Negaunee to some extent.

West end of land I valued at $5,000 an acre comes right into town. Buildings are near it. Section is built up, and building lots are limited. New main line of South Shore strikes old main line near center of Sec. 6, which on this map (Complt.'s Ex. 17, Belden) is only short distance to where hotel is located, interurban line to Ishpeming ends, and important business buildings are located.

334 Main street is two blocks away. Best residence district in Negaunee.

Main street is not paved, but there are sewers, water and electric lights. From there, right of way crosses southern part of Maas, Lonsdorf & Mitchell Add., which contains only a few houses. On south side is Sterling's Add., which has a large number of houses and is available for buildings. We paid $30,000 for 5.22 acres from Maas, Lonsdorf and Mitchell interests, and Mr. Townsend was wrong in including more than 8 acres to that sum.

It is estimated there are 800,000 tons of ore under the south two-thirds of old South Shore right of way, within lines drawn perpendicularly through side right of way lines, which are 60 feet apart. Ore is opened up on both sides of right of way; there is a shaft or two through right of way, so it is well known what is there. That is only a part of ore for which the charge was made.

As I said before, in order to maintain right of way, assuming depth of 800 feet, 400 feet on either side of right of way, or strip of 860 feet wide, would have to be left, but this 800,000 tons of ore is between perpendicular lines of a forty foot strip of a sixty foot strip. When abandoned, south two-thirds of right of way belonged to American Mining Co. and north one-third to Cleveland Iron Mining Co.

The Pioneer Iron Co., grantor of the right of way, sold largest tract to one Adams, who sold the land on north and south of right of way and bounded it by lines of right of way. He then quit-claimed to Cleveland Iron Mining Co., which sold south two-thirds of right of way to American Mining Co. South Shore had only an easement, and right of way, therefore, reverted. People who owned land on the south side adjacent to right of way claimed it, and they could dictate terms to us.

335 Deed from Pioneer Iron Co. of the right of way was peculiar in that it was a warranty deed of land, while the board of directors had only authorized granting of usual right of way, and copy of their resolution was attached. We took the position that, since instrument exceeded authority, it passed only right of way. South Shore could only acquire land for right of way.

Longest term leases in Ishpeming-Negaunee district are for 20 years, and they are terminable, on reasonable notice, for mining operations. Most are for shorter terms. Many owners of houses here

rent ground for small annual ground rent and taxes. This is general, and not limited to one company. Leases provide that opportunity shall be given to remove buildings upon termination.

Ground rents are small, and only nominal; for instance, lot worth $1,500 rents for $12.00 a year. Lease is generally renewed if land is not needed. Leases are not limited to our own employees, although they are preferred. Tenancy is at will, in case mining operations reach point, but is really not at all will, for the only contingency that could terminate the lease is need of land for mining purposes, which need is determined by lessor. Grants of right of way are generally upon same condition. We have some terminable upon mere will of company, but we never accept them if we can help it.

Piece of land we had to perfect title on was in section 33-47-26. Maloney mortgaged it to McKenna, who had no other title of record. We bought from McKenna, and 25 years later Maloney sued in ejectment. We compromised for $300, but later found deed Maloney had given McKenna, which had never been recorded. We sued Maloney in ejectment, and won. That was description we bought of Muck.

336 On December 30, 1913.

BELDEN, Recalled by Plaintiff.

Direct examination.

By Mr. Eldredge:

I know the property described in Complt.'s Ex. 1*b*, as item 39, Marquette County. I think its fair market value approximately $500 an acre. I arrive at that value from the value of nearby or adjoining similar land, without improvements or timber.

Item 41 lies immediately west of item 39. As you proceed westerly, the value increases, and I think the fair market value of that parcel averages $750 an acre, in present condition, without timber or improvements. In all valuations hereafter, I will consider the land as in the same condition, unless otherwise indicated.

I think item 42 is worth, on an average, $5,000 per acre. I had charge of securing that entire right of way.

I don't think I placed a high enough valuation on item 43, when I testified before; I think that parcel averages in worth approximately $9,000 an acre. My reason is its proximity to the business section of Negaunee, extending from near the fire hall, at Division St., practically to the depot. That is all available and desirable for commercial and business purposes. I add $4,000 an acre for that reason. I am figuring that as platted, like adjoining property. This parcel extends from the point where the new main line joins the old main line, then to the junction of the south line near the depot; it adjoins the platted portion of Negaunee, and nearly the whole length of the business portion. If that were platted into lots, six to the acre, I estimate they would bring an average of $1500 apiece, basing my values upon what adjoining lots sell for.

337 All lot values there take into consideration the effect on the mineral value. I place the value in the same manner that we would place it on business lots adjoining. As nearly as I remember, I included this parcel in former testimony with parcel 42, at an average value of $5,000 an acre. In my judgment, this property, for city lots, is worth that sum an acre. In addition, it has a mineral value. The value of the right of way is enhanced over its commercial value by the fact that the South Shore has a title which entitles its railroad to remain there permanently, whether mining operations are desired to be carried on underneath or not. I am not placing a valuation on this enhanced value, but one based on sales, assessed valuations and commercial transactions relating to adjoining property.

I think parcel 44, situated in the heart of the business section of Negaunee, has the highest commercial value of any parcel of the right of way at Negaunee, and I give an average value to it, based on the commercial value of the land and adjoining land, of $12,000 an acre. Item 44 is connected on the east with item 43, which I valued at an average of $9,000 per acre, and on the west with item 45, which I value at $7,500 an acre. I place the highest value on the middle part of item 44, which includes the depot sites, and that is considerably higher than the $12,000 I mentioned to bring up the average of the whole parcel.

Item 45 extends across the property of the Jackson Iron and Cleveland Iron Mining Companies, from item 44 westerly across the city limits of Ishpeming. I think its fair value, for all purposes, about $7,500 an acre.

I place an average value on item 46 of $5,000 an acre, keeping in mind that its westerly end, which reaches nearly to the depot at Ishpeming, would be more valuable than its easterly end.

338 To value item 46½, I divide the property into two parcels, by extending the north line of Canda St. through it. The portion lying south of this line might fairly be valued at $4,000 a lot, 6 to the acre, and the northerly portion at $2,000 per lot, 6 to the acre. This property is immediately opposite the depot of the C. & N. W., whose right of way adjoins that of the South Shore on the south, and this particular parcel is a most valuable location for business or commercial purposes. Canda St. is shown on another map as Church St. The property I am describing covers three tracts there, one marked .15 acres, another marked .53 acres, and another marked .08 acres, and below these on the map a narrow strip colored in green. My valuation includes the right of way there, as well as the depot grounds (map of Ishpeming offered in evidence, Complt.'s Ex. 15*a*, Belden.)

To value item 47, you have to subtract from it the land described under item 46½, which takes the depot lots and 460 feet of the right of way. On the remaining 4,550 feet, I place an average value of approximately $12,000 an acre. I previously testified that items 46½ and 47 could not be acquired for less than $150,000. I still adhere to that view, because that involves consideration of the cost, at present, of attempting to secure, by purchase or condemnation,

through the heart of Ishpeming, a right of way for railroad purposes. I reached that conclusion by different methods of valuation entirely than the $12,000 an acre that I have given here, where I am speaking only of the value of this land for commercial purposes based on the value of adjoining land, exclusive of consequential damages or anything of that kind.

Item 47½ would be worth about $600, without improvements.

I modify the valuation I put on item 48, of $3,500 an acre, when I testified before, to about $2,500 an acre. A portion of the
339 land is not so very valuable. Its easterly end reaches over to the soft ore formation of the property on section 16, where Hematite Mine, of the Lake Superior Iron Company is located.

I am fairly familiar with the value of the right of way of the South Shore road west from Winthrop Junction, as far as Clarksburg, or about 10 miles west of Ishpeming. This would include item 49 and part of item 50. I place an average value of at least $100 an acre on that 10 miles of track; it might have a value in excess of that, on account of the permanent character of the right of way. I am not sufficiently familiar with the mineral formation all of that distance to fairly appraise the value of the permanent non-caving character of the right of way; I know from experience in purchasing rights of way for the L. S. & I., which parallels the South Shore for 7 miles of this distance, that it has a value of at least $100 an acre through that territory, exclusive of mineral prospects. That is what our right of way cost, on the average; our right of way is conveyed by a deed which gives the mining company the right to require the railroad to remove, on nine months' notice, in case the line is needed for mining purposes. The South Shore has a right of way which cannot be interrupted for mining purposes, whose additional value I am not attempting to appraise.

I place an average value on item 58 of about $3,500 an acre.

I place an average value of about $500 an acre on item 59.

I put an average value of about $3,500 an acre on item 60. That includes only the part in actual railroad use.

I give an average value on item 61 of $5,000 an acre.

340 I place a higher value on item 62, because that brings the right of way up to the depot property. I give an average of $7,500 an acre to parcel 62. There is a piece of right of way owned by the South Shore across this property, but it has not now railroad tracks upon it; it is where the overhead crossing of the Northwestern used to be. It is of the same value as the remainder of the parcel.

I put an average value of $3,500 an acre on item 63. The most valuable part is in section 10, where it crosses the platted portion of Ishpeming, and across big working mines. A part of this line described in item 63 crosses the Jackson Iron Co.'s property. There the element of value, calculated with reference to this being mineral property, is high, though it is not in the platted portion of Negaunee. It is 60 foot right of way from mile post 167.06 across section 1, about ¾ of a mile.

I give item 64 an average value of about $5,000 an acre. In previous testimony, I valued item 65 at $2,500, or more, per acre. I

then had in mind the cost of condemning that land and the consequential damages to adjoining property, but, based on the decision in the Minnesota Rate Case and valuing this land with reference to its value exclusive of such damages, I think I would reduce that to about $500 an acre.

I value item 66 at about $500 an acre, and item 67 at an average value of about $3,500 an acre.

I value the track rights to mines, being items 68, 69 and 70, in the same manner that Mr. Riggs and I valued others of the branches in my previous testimony—about $1.50 per lineal foot.

I previously valued item 71 at $2,500 an acre; I think that ought to be reduced to about $500 an acre.

341 On Defts.' Ex. 21, Hansel, is a narrow strip of land, colored yellow, commencing a little west of the Harvey lots and connecting the south line of the South Shore with the Palmer Branch. This is included in item 62. It is substantially the same value as the other land in item 62.

BELDEN.

Cross-examination.

By Mr. Wykes:

I am an attorney for a railroad located in this same locality. I testified on the previous hearing that it cost considerably more to purchase lands for railroad purposes than the normal value of the land, say, three times as much. That is borne out by my experience in the territory that I have been testifying about this morning.

I have condemned land for railroad purposes in this locality. In those condemnation proceedings, we had a number of witnesses who testified to very much lower values than I have given here today. Those lower values were not accepted by the jury, who, in each case, put values as high or higher, on mere surface rights, than I have placed here on permanent rights of way. The surface and mineral estates throughout this territory have been separated by deed, and are largely owned by different parties. In some of our condemnation cases, the petition was filed only against the surface owner. No condemnation suit tried in this county in the last ten years has ever gone to a decision on the value of a permanent non-caving right of way in the mineral district.

I think item 39 is not underlaid with known ores. The ore formation shown on the government geological maps does not extend as far easterly as this parcel. Geologists feel considerably uncertain as to the exact easterly limit of the ore formation. I eliminate the remote possibility for minerals in valuing that parcel. I have

342 taken into consideration the topography of the country there, and that this entire territory surrounding Eagle Mills has been acquired and is held as a town site for use, with reference to the territory east of Negaunee, where new mines are being opened up, and also its suitability and adaptability to railroad purposes as now used, but without allowing anything for consequential damages.

Eagle Mills has no population. The entire city of Negaunee is believed by geologists to be underlaid with iron ore, and that it is only a question of time when that city will have to be removed, to permit the mining of ore. This territory to the east, down as far as Eagle Mills, has all acquired greater value because that is the only place that the town can be removed to. That land is all acquired down there, by what might be termed permanent holdings, with a view to the future. West and south, you go right into the mineral formation again; to the north, the topography is not desirable for a town site. Nothing has been done to remove buildings to this place from Ishpeming or Negaunee; but within the last two years, the city cemetery, containing over 6,000 bodies was moved, as the first step in this direction, from the ore formation near the mines in Negaunee down to more than half the distance toward Eagle Mills; and it was put in that direction because of the probable location of the town in the future.

If that removal should take place, it would send values in Negaunee high up, because you have to buy that property before you can secure the removal of these buildings. The cemetery has gone a mile and a half west of Eagle Mills and at least 2 miles from its old location in Negaunee. If you were to eliminate the possibility of the removal of Negaunee to Eagle Mills, then I would treat this right of way at Eagle Mills about the same as the right of way west of Ishpeming, $100 an acre. We purchased N. W./N. E. 33-48-26 for $12,000, or $300 an acre, several years ago. It is about ¼ of a mile from this right
343 of way, and I know that the C. C. I. Co. now holds this Eagle Mills land at value I have given, or more. Within the last year, plaintiff bought a small lot here, for a section house, and we charged them $200 for it. They have not bought it yet, but are to.

The property in the city of Negaunee is not assessed as high as the valuation I place on it, and I have not considered assessed valuations, except in an incidental way. I think the assessed valuations in Negaunee are higher than the property is worth. I based my testimony on commercial transactions in the city.

In sections 33 and 34, we had a good many transactions with reference to land, not only in acquiring rights of way, but also in reference to riparian rights, along Carp River. The Negaunee mine drains the water which is pumped from the mine into a small stream which flows into Carp River, and it has caused that river to overflow on some of these descriptions; the owners have asserted very high values on that land, and we have paid quite large sums, by reason of those claims, and to acquire the right to continue flooding in the future. We did not buy a foot of the land; we simply purchased the right to flow the water from the Negaunee mine through those streams. It is only occasionally that it would overflow. They are using it for farming purposes right along. This situation took the water from the Negaunee mine through the nearest established water course.

There have been no recent transactions in the territory on sections 26, 27 and 28. I do not know of any other sales on sections 33, 34 or 35, except as is covered by my former testimony, nor any sales on sections 2, 3 and 4 of 47-26, except as covered in my former testimony with reference to section 4. I do not know of any sales on those

nine sections between individuals, although there may have
344 been small sales there. That property is practically all held
by mining companies. It is their policy not to sell the land; they lease it. The Cleveland Cliffs Iron Co. is holding its land with reference to future value. It is not for sale.

I know of no sales opposite description 39 between individuals. If there have been sales between farmers a further distance away, I have not those in mind, and have not used them as any basis for my testimony. I have used as such basis the sales to mining company, to the city of Negaunee, the contemplated sale to the South Shore, and the purchase of the water rights along Carp River. I think I would make the value of $500 an acre exclusive of the element of suitability for railroad purposes, although I stated that I used that element in my former testimony. The Iron Cliffs Co., a corporation the stock of which is owned by the C. C. I. Co., purchased section 35 at least four years ago. I do not know how the assessed valuation by the Tax Commission was obtained. I do not know what was paid for section 35. I didn't have reference to the price paid for this land, in fixing my value on item 39.

Item 41 lies in sections 33 and 34, 48-26. My value on that was placed on the same considerations as on 39, grouping all the considerations I have mentioned. As you come further west, you approach the mineral formation, where you have an added element of value. The $250 additional per acre on this tract is due, to a certain extent, to the fact that you are approaching the locality where there is a possibility of ore values, and to the general character of the land. It is nearer the city of Negaunee, and nearer the mineral formation, and for both these reasons I think it more valuable than the land at Eagle Mills. There is no ore body known that lays as far east as that. The west end of parcel 41 is almost adjoining what I paid over $1,000 an acre for, for just surface, on condemnation proceedings by the L. S.
& I. to build our track to the Negaunee mine. Less than one
345 forty from the west end of this parcel, the jury in 1911 fixed the surface value at $1,000 an acre.

I undertook to prove that those valuations were too high, but I never convinced anybody of it, either in condemnation proceedings or in purchases from private parties. We attempted to prove values at $100 to $500 an acre, as I remember it. There is a remote possibility of some mineral in this locality.

The sections through which item 42 runs is described in my former testimony. The $5,000 territory extended from the southeast corner of 33-48-26 to the center of section 6-47-26. We paid $5,000 for all except a small portion in the Negaunee mine property, on section 5. The purchase of that territory was based upon a commercial value of that surface for building purposes; that was the ground the owners took in putting that price on it, that this was the only territory available for building homes for the men who would live at the Lucky Star, Athens and other new mines about to be opened at Negaunee, and that this land had an actual value for such purposes, irrespective of railroad use or anything else.

There are some scattering houses down that valley; no new ones

since the track was put through; they are just sinking the shafts at the Lucky Star and Athens mines, and have not opened them up for shipment as yet. In locating this 2.6 miles, they selected the site regarded as least likely to affect the ore body, and a permanent right of way was given, so that the use of the railroad would never be interrupted. There is no known ore under this tract, but a great deal more than a possibility of ore. This district, as you come further west, enters the known ore formation, where there are working mines on both sides of the right of way, and it is quite different from the one you were asking me about a moment ago.

346 I do not base the value of this tract entirely upon the purchase which was made of the particular land itself. That price of $5,000 per acre has been asked and paid in that vicinity for at least 5 years and more last past, for railroad purposes, and in purchases of this character in that vicinity it would not be fair to apply to the price we paid the statement in my former testimony that we were often obliged to pay from 2 to 3 times more than the other value of the land when we were purchasing it for railroad purposes. This is the price which is put on that land and for which it is held. If you wanted to buy it for any purpose, I don't think you could get it at any lower price. It is all owned by mining companies or parties interested in the ownership of mining lands. None of it has changed hands within 5 or 10 years, except this strip and except in adjusting boundary lines or ownerships, or something like that. When I gave my testimony before, I had not informed myself as fully as I might have done, and, in reading over my testimony since, I notice the various things in which I thought it ought to be modified or changed or corrected in the way I have now done at this hearing. I gave what I thought was my best judgment at the time. It was not as mature in some respects as it was when I considered it afterwards.

To item 43 I have added $4,000 an acre to my previous testimony. The tract runs from the center of section 6 up to about the location of the depot property. I have affected this value with the present use of the adjoining parcels, without attempting to add anything to that valuation by reason of the fact that the railroad has what we call a permanent right of way at this point. I think that gives it an additional value, but I haven't attempted to appraise that. The lots are all sold subject to a reservation of the minerals. Some of the deeds have caving clauses, and some have not. All present sales are made by deeds which would enable the mining company to secure

347 the removal. Our companies will not sell any lots in that portion of Negaunee at any price; we simply lease them, under leases which fully protect mining rights and give the right to take possession.

Adjacent to item 43, the mineral estate is all owned by mining companies. The business property and surface is owned chiefly by individuals. Some of the lots are owned by the mining companies, which they will not sell at any price; some of the mining company lots are vacant and some occupied. I don't think of but one vacant lot owned by an individual. Near item 43, within the last few years, there has been erected the new fire hall of the city, right up Division

St., less than one block from this right of way. Across Division St., on the corner of that and Iron St., there has been a new two-story frame building erected—a business block. Right opposite the point where the right of way crosses the C. & N. W., the Negaunee State Bank has put up a very nice two-story brick building. The buildings I have mentioned are all within a block on the northerly side of this right of way. This is right opposite the best part of the business section of Negaunee. In the event of the removal of Negaunee, these new buildings will have to go. There are no present plans for moving Negaunee, and it will not be for a long time.

There has been no sales nearer than a block from the right of way; there have been, so far as I know, only these few sales that I have mentioned. In the values I fixed today, I have not used sales and transactions between individuals very much, to fix prices. I have made inquiry as to such sales as I could find out about at Negaunee, but there have been very few transactions between individuals.

The value fixed on the $24,000 an acre portion of item 46½ was due to its location near the C. & N. W., which adjoins the
348 D. S. S. & A. on the south, and to its location near the important business streets of the town. It is bounded on the west by First St., on the east by Second St., and on the south by the right of way and station grounds of the C. & N. W. Ry., and it is practically in the same block as the new postoffice site. There is a possibility of considerations affecting a parcel of property that would not affect the parcel adjacent to it or adjacent to the one affected.

When I divided 46½, the considerations which surrounded the specific tract on which I placed a value, double the other, are important, in my judgment, in determining what the value of that specific tract will be. In valuing item 43, I have considered the valuation of this right of way as if the railroad did not exist there any longer, and that the land included in the right of way would be naturally and immediately included in this platted portion of the town and be suitable for business and building purposes, like the rest of the city. To have the South Shore away would improve the value between the street intermediate Iron St. and the railroad. I took all those things into considerations, and thought that the price which I put on it would be a fair present value of the property. I considered the property just as it is.

With the few exceptions I have mentioned it is practically impossible to give you sales or commercial transactions through this mining territory. My judgment is based upon all the elements mentioned in my former testimony and this morning, including the commercial value, the assessed value, the possibility for railroad use, and the relation to the ore, taking into consideration the conditions of mining, and everything of that character. Another man, of the same ability, integrity and knowledge as myself, might hold an entirely different opinion. I would be surprised if another
349 expert on land values varied as much from my last figure as I did between my first of $5,000 and last figures of $9,000, if he took into consideration the same facts and circumstances that I have, and the same elements of value. I don't know any mathe-

matical calculation that you can apply in determining value of any property; all value is matter of opinion. My opinion is that in order to purchase the property a man would have to pay the values I have given.

I do not think there is anything strange in the fact that one-half of item 46½ should be worth twice what the other parcel is, considering its location and surrounding. If, instead of generalizing on a strip of right of way several miles long, we had gone in and taken the specific parcels and placed a value on them, we might have come out at a different result, but I have not been just guessing wildly here. I have considered with the utmost care, and in detail, these rights of way where I have put these high valuations; I have taken the trouble to go out on the right of way, personally, and see what use could be made of this land, if there wasn't any railroad there; just assuming it was ordinary commercial property, and see how this right of way would fit up with the lots from which it was taken, and the uses which would be made of this property in connection with adjoining property; I have based my value upon such consideration as that.

I have not been generalizing on long stretches of rights of way with the exception of that ten miles west of Ishpeming, where I said it was worth, in my judgment, at least $100 an acre, basing that upon our experience in acquiring parallel line. I have not refined the other descriptions as closely as I have refined 46½, but I can, if you wish. I can go on west from that and cover the next mileage, or I can go back to Negaunee, where I have put that high price, and tell you who owns the adjoining property and what it is used for,
and how this right of way would be available and valuable if
350 the railroad were not there. Where I said $3,500 on the
South line, running from Eagle Mills over to the Harvey lots, we paid in that vicinity as high as $5,000 an acre for rights of way, and over at the east end we have paid a good deal less. I took all of that into consideration, and struck an average of $3,500. All that was on purchases, not condemnation proceedings.

In my previous testimony, I fixed a value of $5,000 an acre on item 44, now valued at $12,000, with the statement that the eastern end of it was worth more. In reading over my testimony after it was written out, that was one of the parcels which attracted my attention as not having been valued at quite as much as it should have been, and I suggested to Mr. Eldredge that I wanted to raise that and to lower one or two others. My value was fixed by running the character of the plat of the adjacent territory through that and estimating on the basis of lots and considering the value of those lots for commercial purposes, like other property.

I have not at any time this morning intended to use the expression of suitability for railroad use as enhancing the value of any of the parcels which I have mentioned. I used the term more as descriptive, and perhaps ought not to have used it at all, but the values which I have given on all of these parcels have been based on my opinion and judgment of the commercial value of the property, regardless of railroad use. I formed the opinion that this railroad

property would have a value based upon the value of similar property in the vicinity of the right of way, or contiguous to it.

I think the railroad property in parcel 44 would be more valuable than the land south of the right of way, and substantially the same as the land on the north. One side is business blocks, hotel and various places of business, and the other vacant land and a sort of bluff. A portion of the land on the south side would be good
351 business property. There is a warehouse or two there, and then after you cross the street you encounter a bluff and rough broken land, not valuable for building purposes. The land north of the railroad is built up solid, and in arriving at its value I have taken into consideration the value of that property, as well as I could determine it.

I have had dealings with the occupants of probably half of the lots, starting with the Collin's house, where Iron St. and the railroad right of way converge, and running easterly to the hotel by the passenger depot; we have not bought or sold any of those lots. That land is valuable. It was acquired by the Jackson Iron Co. in the fifties, and they have never parted title with that land from that time to this, but have leased the surface.

These buildings I am speaking of front on Iron street, the main street of the city, which runs parallel with this right of way, and the rear of those buildings back up to this right of way. I have had dealings on account of some ambiguity in those titles. We haven't bought or sold, but have paid considerable sums of money in there, to straighten out difficulties of that kind. I don't think of a single sale in there. I have taken into consideration the rental value of property there, and its location, which is parallel to the main business street of the city, and the prices which have been paid for business lots around the city.

I purchased some lots for the school district, further up town than this, not over four blocks from parcel 43, and a little farther from 44. There we paid prices very much higher than anything I have given here. We began a condemnation suit, and it was settled amicably afterward, but the price per lot paid was very high. In my former testimony, I had taken the basis of $2,000 a lot, six lots to the acre, in the heart of the city of Ishpeming. When I came back and read this testimony and found that I had placed a great deal
352 lower value on this stretch through the business section of Negaunee, I thought it a mistake, as property was worth, in every respect, as much as the property at Ishpeming; land values at Negaunee have, on the whole, been rather higher than at Ishpeming.

I made my calculation, to begin with, at Ishpeming, basing it upon certain transactions where prices had been both higher and lower than that, and adopting that as a fair average value for this property right in the heart of the business section of the town, and then I applied that to Negaunee, because experience has shown us that land values in Negaunee are quite as high as, if not higher than, at Ishpeming. In fixing the $2,000 lot value, I had the sales in Negaunee of which I have told you, the school property, the railroad

rights of way, and purchase of lots in connection with mining property.

Since I was here before, certain lots on Main St., in Negaunee, have been sold at higher than the $2,000 a lot I am talking about. Main St. runs parallel with the right of way. Those lots would be opposite the westerly end of the 2.6 miles of new right of way. They took the title subject to mineral reservations.

Going back, farther east, A. Maitland is platting lots on the back end of his property, away from Main St., and fronting on what now constitutes a part of the abandoned right of way shown on Complt.'s Ex. 15. He has sold some of those lots at varying, but substantial, lot prices, with mineral reservation.

I would not say that I based my valuation of Negaunee property upon the valuation in Ishpeming. I simply mean to say that land values in Negaunee are probably higher than in Ishpeming, the reason for that being that there are now being opened in the vicinity
353 of Negaunee several new mines; there are three big shafts being sunk on the easterly side of Negaunee at present and others south. That will bring hundreds of additional miners to Negaunee with their families, and will call for the building of homes; that is the present need for building property that I had in mind when I was speaking of the high value for commercial purposes of the land along this right of way east, all the way down to Eagle Mills. That is the only direction in which the town can grow, and the territory along that, adjacent to it, will have a high commercial value for that purpose. The population of Negaunee is about 8,000 and Ishpeming about 12,000.

My reference to the removal of Negaunee is entirely a remote prospect, and the building of homes for the men to employ in these new mines is a present prospect. It may be that this generation will not see any change in Negaunee, so far as its removal is concerned. I did not intend to say that the Eagle Mills land had a future value of 400% on account of the removal at Negaunee. I mention that as something affecting its future value, but the thing which bears immediately upon this value, and the value of all the land easterly along the line of this railroad, is the opening of these new mines, and, while I may have discounted the future quite a ways in putting those values down at Eagle Mills, I think, if you take into consideration the immediate prospect for building there, that the valuations were reasonable. If we were to consider it from the standpoint of what it would cost to acquire a right of way, I wouldn't for a moment be understood as saying that you could get a new right of way through this territory for any such amounts as I have given.

I would feel absolutely certain that it would be beyond possibility for any railroad company to condemn a permanent right of way across this mineral formation, through the heart of Negaunee,
354 for any such price. Taking into consideration the location of known operating mines and mines being opened up, there isn't any other feasible right of way into Negaunee. I have made no computation to figure up what my valuation will amount to for the whole right of way. I realize that there is a limit to land values

beyond which a passenger road would not enter the territory to serve 20,000 people. That limit has not been reached in the figures here. I know that the figures I am giving are just what railroads have been paying to get in for all service. There is a limit beyond which it would not pay to expend money, but, as applied to these towns, they constitute a part of a large district where the business is of enormous value; the railroad wants to get in to serve the whole business. I am not attempting to divide my values on any basis of part passenger and part freight.

I have been in Ishpeming since May 1, 1903. Land values have gone up in that time; there have been very material developments, in a mineral way, in that district since then, and that general tendency has affected the entire district, because the prosperity of that district depends entirely upon a single industry, and the discovery of a new mine of iron ore helps to guarantee the permanency of the town and the employment of labor there, helps property values, and makes the prospect of additional mineral less remote. Mining men and railroad men in general have a conception of considerably higher values for land in and around Negaunee and Ishpeming than they did when I came there. The State has estimated a life for our mines of fourteen or fifteen years, and experience has shown that new bodies of ore are opened up from time to time, so that this district is still shipping at practically its maximum. Ishpeming and Negaunee have no other industry, and the future of those places depends upon the prosperity of the mines.

355 I fixed the value of Item 45 by the fact that it crosses, for a little more than a mile of the distance, section 1 of the Jackson Iron Co., where we purchased property for railroad purposes, and it also has the great element of value of the character of the title. The mineral value entered into this particular tract. In the values which I have placed upon land between Negaunee and Ishpeming which is not built up. I have taken into consideration the value of this permanent right of way to the railway company over a mineral formation practically all the way.

I cannot say that there are known ore bodies actually disclosed by drilling all the way from Negaunee to Ishpeming, but there are very strong mineral prospects. Rights of way are guarded by the Mining companies with the same degree of care as they would be if the metal was known to be there. A right of way is not an encumbrance alone because it occupies a strip of land which may be fifty or one hundred feet wide, but also because if ore is ever found it may tie up operations for a great width each side of that right of way, to preserve the right of way from caving. I don't know any known ore bodies that have been opened up by drilling along or under this parcel of land. There are no opened mines between Negaunee and Ishpeming. The State Board put high values on every description around Ishpeming and Negaunee that had any iron ore on or near it.

Without the presence of mineral or mineral prospect, the value of parcel 45 would be considerably less, probably in this particular piece of right of way more than in any other. There isn't very much building along this tract; a few miners' houses and gardens along it.

There is a little brush on some of it. The difference in the value of this tract and of item 46 is what I thought you would give to the mineral element of the right of way. Whereever a right of way is
356 on what is commonly called the soft ore formation, where the surface is likely to be caved, this element of value is very much greater than when you reach the hard ore formation, where the caving process is not used. There, mining operations may continue, as in Ishpeming, underneath it without interruption.

Parcel 46 starts out by Union Park, in vacant land, and runs right into the city of Ishpeming, extending almost to the depot, so that the west end adjoins warehouses and lumber yards, and some residences. Property of that kind in Ishpeming would be quite valuable, and I thought $5,000 an acre a fair value. Here, I am getting more into the question of the commercial value of the property, as distinguished from this element of mineral value, I would fix a higher value on the west end than on the east end of that strip. When I testified before, I put a value on the east end of $3,500 an acre, and I think that would be a fair statement now, and make it enough higher on the west end to strike this average of $5,000 an acre. I would bring $3,500 value for about one-half of the way. In my former testimony I had the value of the west end at $7,500 an acre, and the east at $3,500.

In fixing my values on Item 46½, I based them on specific sales only in part. There have been a few sales of vacant lots within a block or two of that location. The most recent is the sale of a number of lots, in the block immediately south, on the other side of the C. & N. W. right of way, to the Government, for a postoffice. I know nothing about the price, except what I have read, but the newspapers stated the consideration at $12,000. That value is somewhat less than I have placed on this property. The property in that immediate locality on the south side of the C. & N. W. right of way is, in my opinion, of considerably less value than these lots of which we are speaking.

Going over to Main St., on the corner of Main and Barnum Sts.,
357 the city bought a vacant lot and a half there, for a library site, some years ago. My knowledge of the purchase price is what I have read in the papers. I think it was $5,000 for about one lot, a block or so back from the business part, with nothing but houses all around it; but it is on a good corner. It is a lot and a half of the Excelsior Add., where the lots run about eight to the acre. I have taken that lot into consideration, and also the high rental value of property adjoining the South Shore right of way immediately west of First St. If there wasn't any South Shore railroad in Ishpeming, and we took this property into consideration only for its business and commercial purposes, that particular parcel, which I have defined as the southerly parcel here, would, in my opinion, be worth the price I have fixed. It has not been true there that parcels lying next to a railroad are worth less than those back a little distance. If you go one block to the west, where you come to Main St., the Miners National Bank and the Jenks Block, which contain two of the most important stores in Ishpeming, adjoin the right of way—the rear comes up to it.

On the next property to the east, the building is occupied by Carpenter Cook Co., wholesale grocers, and the fact that there is a side track of the C. & N. W. right at their rear door is of value to them. The next building is occupied by Swift & Co., wholesale meat house, in the same way, with a side track, and you might go right along the same way. Those locations are valuable, and are sought by business houses. In fixing the $12,000 valuation, I considered the same specific sales and the general situation of that property.

That portion of parcel 47 between First and Main Sts. is immediately in the rear of a very narrow strip of land. If the railroad were gone, all of this additional territory would fit right on to those short lots, and piece them out, and make them big enough so that substantial buildings could be put there, instead of small buildings, as
358 at present. Now, it is all built up with small buildings that rent for very high rental, considering the almost temporary character of the buildings.

In fixing the value of the north part of item 46½, I took into consideration the sales in Ishpeming mentioned, but I don't think you can figure out the value of any piece of property exactly or mathematically by reference to what something else sold for. I think each parcel must be determined according to its own particular facts and circumstances. While I refer to these other transactions as constituting some guide as to value, I think we must look at the property and see what it can be used for, and the use of surrounding property. My judgment there has induced the difference between the $12,000 and the $24,000 part of that parcel, rather than the application of one set of sales to one part of it, and another set of sales to another part. Having reference to sales, it was my judgment that $12,000 was enough for the north part of that description. Referring to those same sales, and taking into consideration, in addition, the location, and my knowledge of conditions, I thought $24,000 was fair for the south part.

In fixing the value on item 47, I went over this right of way again, having in mind particularly the questions asked me before. Starting from First St., west to Main, that portion of this parcel would fit right into the lots which front on Canda Street. This right of way between Main Street and Pine is extremely well located. On the east, it would front on the main business street of the town; on the south it would adjoin the C. & N. W. right of way, a portion of which is vacant there, and would make the most admirable location for warehouses or business houses. I am not considering any severance damage at all. I am considering what we would do with this property if the Railroad were not there, and I think that from First Street over to at least the middle of the block between Main
359 and Pine it would have more than the value of $2,000 per lot that I have put on it. From the middle of the block, between Main and Pine, and extending west for the remainder of the parcel, it would have less value, because there it goes through some rocks, and perhaps that would lessen its value on the north side; but I think that the valuation I have placed on that parcel as a whole is a fair average valuation. That takes into consideration that, all

along this portion of the right of way, on the other side of the C. & N. W. right of way, it is built up solid by business houses that back right up to the line of the right of way.

In Item 48, I still include a mineral value on the east end. On the easterly end, if there is mineral there, it is a part of the hard ore formation, and that element of mineral value doesn't exist to the high degree that I gave in my previous testimony. But, on the westerly end, you strike into the soft ore formation again, and, considering the value of the easterly end for commercial purposes, which is still in the built-up part of the town, and the mineral value on the westerly end, $2,500 an acre would be a fair average valuation. The first part of this parcel, starting from the east, would have quite a substantial value for commercial purposes; then you strike a stretch, through the swamp, of much lower value, and then on the west you would come to what appears on the map as soft ore formation. I would go down as low as $500 an acre in the cheapest part of the right of way.

On the east end west of the yard and right of way, it is all houses, residences of miners. The land belongs to the mining company. Many of the houses are owned by other people. All our leases to employees are made on a low annual rental of, perhaps, $20 a year, and they pay the taxes. The lease will be for twenty years on some of those additions, subject only to mining necessities. Our standard
360 form of lease is twenty years, subject to removal in case ore is discovered and it is necessary to open a mine. Many of the lots run $25 or $30 in taxes, making the total payments for the year not over $50 for a lot. The mineral, under the new law, is assessed separately, or else included in the value of the adjoining working mines. I have known of lots selling to miners for $500 or $600 a lot, but the locations which are occupied by miners are remote from the business section.

My figure of $100 an acre on Item 49 is an average, and a generalization. Some of it might go as low as $25, and some of it up to $200. I am basing my judgment quite largely on the average cost we paid on seven miles of right of way paralleling it. We actually paid a little better than $100 an acre on a right of way with deeds that the mining company can require the railroad to get off on nine months' notice. It is in a possible mineral location, but outside of anything that I have a definite knowledge of. Opposite this item 49, I did not base any of my judgment on sales, except the purchases of the railroad company. It is a mineral district, and there are no sales there.

Much of my testimony with regard to values is based upon my experience in purchasing lands for the L. S. & I. I might say of this, and of all these parcels, that I have based my opinion upon our experience in all these lines as I have outlined it in my testimony, and the considerations which I have mentioned on the parcels about which I have been asked would apply equally to the other parcels on the south line about which you have not asked. On the south line, there have been very few transactions between individuals, if any. There are no sales or present settlements of home sites. This

whole district is peculiar in its high land value, but it is easily understood when you consider that it is a mineral country, that the
principal industry is mining, and that it can, in a large part
361 of this territory, be carried on only by caving the surface, and
that has added, across these vacant lands, a great element of value to this right of way, which this company acquired years ago.

I don't know anything about the original cost of any of this, except the 2.6 miles, of which I had charge of acquiring under the contract between the C. C. I. Co. and the D. S. S. & A. Way over at Eagle Mills, there was some of that 2.6 miles that would go lower than $1,800, but it is my best recollection that there was no part of that right of way that we acquired at anything like as low as $500 an acre.

362 On August 26, 1912.

CHARLES V. R. TOWNSEND, a Witness called by Plaintiff.

Direct examination.

By Mr. Eldredge:

I live at Negaunee. I am, and have for 8 years been, agent for Cleveland Cliffs Iron Co.; am Land Commissioner for L. S. & I. and M. & S. E. railroads. For 8 years, I have been buying and selling lands in Upper Peninsula counties of Chippewa, Mackinaw, Luce, Schoolcraft, Alger, Marquette, Baraga and Ontonagon.

TOWNSEND.

Cross-examination.

By Mr. Wykes:

Through the territory covered by my testimony, the demand, and actual sale of land without timber to settlers, has been very large; it is rapidly settling. In the Alger district, there are very large settlements going on; in Schoolcraft, at Seney, the Western Lands Security Co. has sold a very large acreage at very good prices. The company is doing the draining. In Chippewa, I sold a very large acreage of land, without timber, last year to settlers. Luce county, south of South Shore, particularly Lakefield township, is settling very fast; that is splendid farming country—splendid farming communities.

I represented Jackson Iron Co. in a sale of right of way to C. & N. W. in Negaunee 3 years ago, being 1.44 acres; this was from the station ground west to what was called the diamond crossing. The consideration was $2,500 for 1.44 acres, with a provision that we can cave the track and put them off any time.

Q. Didn't you testify, on June 1, 1911, to a sale of acreage in the
city of Negaunee, as agent for the Cleveland Cliffs or L. S. &
363 I., to the C. & N. W., of land between the new depot and the
diamond crossing, right over the Jackson mineral body, 3

acres, and say, in answer to the question, "How much did they pay for it?" "A. They paid us at the rate of about $700 an acre, land that could all be platted, it could all be used for residence purposes, water and sewer; I have figured six lots to the acre."

A. That is in that condemnation?

Q. That is in the Barassa.

A. In the Barassa, now you may be right on that acreage, and, just as I testify, we sold them that, we will put it at seven hundred dollars an acre, but I don't think that acreage is right, but we gave them an easement for a single track road, which we can put them off at any time that we need the ground. We don't agree to give them another right of way. $2,500 is the consideration they paid us.

I gave testimony regarding the value of Barassa tract; I testified that Barassa tract was worth $100 an acre, with the same value for the Martel and Marketti tracts.

Q. And upon what did you base your judgment of $100?

A. I simply thought that the land was low and was not available, under the conditions that then existed, for any—or did I take into consideration the fact, which has developed in the meantime, that those new mines would require land for streets and building purposes; my judgment of $100 an acre which I gave there as my judgment was very quickly upset by a jury of my townsmen.

The Master: What was the date of that?

Mr. Wykes: This was the 13th day of April, 1911. And, in answer to a question of what sales you fixed your value upon,
364 did you not refer to a tract in that neighborhood that you said was purchased of a man by the name of Muck?

A. Yes.

Q. And did you not say that a forty acre tract there was purchased at—I have forgotten what the figure was—a certain figure, what was it?

A. I believe I also testified in the Muck case that we bought a defective title.

Q. You had better see this, before you say that.

A. From Muck? Just a quit claim from Muck, paid him $1,500, as I remember.

Q. What was it you testified with regard to the Muck description?

Mr. Eldredge: Show him the testimony.

Q. You have said that you stated——

A. No, I said I believe I stated.

Q. Now, isn't it a fact that instead of stating, you were approached on cross examination with the idea that this was a defective title that you had purchased, and you said that it was a good title and a title conveyed by warranty deed?

A. No, not from Muck, I couldn't; if I did, I must have been very much mistaken.

Q. Let me read this testimony to you: "Q. Upon what do you base your opinion then when you say that the Barassa property is worth two hundred dollars an acre and the Martel property $100 an acre and the Marketti property at the price you put upon it? A. Prop-

erties that I have bought right adjoining. Q. How long ago? A. Within two years. Q. Where was that piece located?
365 A. Right to the north of the Barassa and Martel lands. Q. How far north? A. Directly adjoining. Q. You bought a tax title? A. We got the title."

A. We got the title, which the court afterwards affirmed. We did have—at that time we didn't buy from Muck. As I remember it, he gave us a warranty deed; of course, we knew Muck wasn't responsible, and couldn't warranty anything.

Q. Let me read a little further. "Q. By whom owned? A. By Charles Muck; we paid a thousand dollars for forty acres. Q. What title did Mr. Muck have to it? A. He had a title which was approved by our counsel. Q. Are you not in litigation on that title at the present time? A. Yes. Q. You brought a lawsuit? A. Well the other fellows brought the lawsuit." Let me read further, and ask if you gave this testimony: "Q. You understand you are basing your testimony on the value of the land as it is today. Now as to the price today considering these values and the circumstances surrounding that land, upon what do you base your opinions? A. Only yesterday we had an offer of forty acres good hay land. Q. Where? A. Two forties east of the Martels on section 34 at one thousand dollars." That is correct, isn't it?

A. Yes.

Q. Did you buy that land?

A. No.

Q. Didn't think it worth a thousand dollars?

A. Couldn't get a title.

Q. You didn't tell that to Mr. Barassa, when he was examining you.

A. No. That was just yesterday, wasn't it, I said there——

Q. Only yesterday.

366 A. That was the offer; then it takes time to look it up, and our counsel wouldn't approve it.

Q. What were those descriptions?

A. Well, I can't tell you now.

Q. Who owned the lands?

A. I can't tell you.

Q. Can you give us the descriptions generally—what part of the section they were in?

A. Just in a general way; that was either the south half of the southeast quarter of 33, as I remember it, or the south half of the southwest quarter of 34.

Q. Do you remember the names of the people?

A. No, I do not.

Q. Was the acreage of this parcel that was sold to the C. & N. W. three acres.

A. As I took it off the copy of the deed this morning, I only made it 1.44.

Q. Here in your testimony you say you figured it six lots to the acre. How did you figure that up? You bought a certain number of lots there?

A. We take a lot, call a lot fifty by a hundred and fifty, 750 square feet to a lot.

Mr. Butler: 7,500.

A. I mean 7,500, and we buy six; that is practically an acre of ground—practically forty-three hundred thousand feet.

Q. From your testimony here, you evidently figured the number of lots there and figured it into acres?

A. Yes, take the lots fifty by a hundred and fifty.

367 Q. And this was very soon after you had had the transaction?

A. Yes, a year or so.

Q. And your recollection of that would have been better at that time than now, wouldn't it?

A. Yes.

Q. Do you remember having stated at that time that there were other lands for sale in the vicinity of Negaunee?

A. Yes.

Q. Whose were those?

A. George Maas and Mitchell.

Q. Where were those lands?

A. They were north of the Maas mine.

Q. And how far this way from the center of town?

Mr. Eldredge: This way?

Q. Wouldn't it be this way?

A. Yes, it would be northeast.

Q. Northeast from the center of Negaunee?

A. Yes, a mile and a half.

Q. Those lands were divided into lots, were they?

A. No, it is acreage property.

Q. You had that for sale, did you?

A. No, had an option on it.

Q. You had an option at the time?

A. Yes.

Q. Were they sold?

A. No, we didn't exercise our option.

[Folio 368 missing.—Printer.]

369 Ishpeming is the surface. The minerals are always reserved.

TOWNSEND.

Cross-examination.

By Mr. Wykes:

In Negaunee, the business part of the town lies north of the right of way, which is the present south limit of the business part of town. The business buildings abut the track there. The sales in the business part on which I based my values are north of the railroad, some abutting the railroad. For four lots on Pioneer Ave., the west side abutting the South Shore track, there has been an offer of $2,500 a lot, 33 x 100 feet. That involved the right to put and maintain

permanent structures on the ground, with a removal clause in case of the finding and necessity of mining iron ore. I don't want to tell who offered that.

Four years ago, I had an option on a lot on the corner of Pioneer and Iron Sts., 50 x 100, for $4,500, for a Y. M. C. A. building. The owner said he was donating $500 to the Y. M. C. A. His estate sold the lot for $4,300 cash, with no structures. Iron is a main business street of the town, and Pioneer is a principal business street. At that time, this lot was four blocks from the postoffice; now it is within a block. We did not take up the option. The lot was sold about 3 years ago, and a concrete block put on it. Our lots are between that and the track, 400 feet. The entire property on those main streets is built up for a considerable distance; starting at the corner of Pioneer and Iron Sts., north, the business part runs about 3 blocks. It does not run farther east than Pioneer St., and runs west, about five blocks, to where the South Shore intersects Iron St.

The new building put on the lot, corner of Pioneer and Iron, cost, perhaps, $15,000. The bank block on Iron St., 1½ blocks
370 west, cost $40,000; the Perkins Block, in the second block from this, cost $30,000; the First National Bank Bldg., two blocks away, cost $40,000. The old bank building, burned, was on the south side of Iron St., next to C. & N. W. main line. After the building burned, the property, with a small lot adjacent, was sold for $13,000, to a new state bank, the land being the equivalent of two lots 50 x 150 feet. The bank did not stay there, because the other side of the street, away from the railroad, is the most desirable.

I also had in mind the sale of some unimproved lots opposite this old bank property, on the south side of Iron St., between Silver St. and the C. & N. W. main line. It was bought 2 years ago, by Winter & Suess, for $2,250. It is about 125 feet on Silver St., and triangular, running from 100 feet in depth to 25. Next to the South Shore track, it is 18 to 20 feet. At the furtherest extremity north, below the surface of Silver St., it is perhaps 8 feet.

I base this value on no other lots that are in that immediate vicinity; there is no property for sale. Those I mentioned constitute the sole basis of my value, as far as actual sales are concerned. With the unfortunate conditions surrounding property in Negaunee, with reference both to dwellings and business places, there is no property for sale. It is not a question of the actual merit as to the value of the property there. If there is property for sale, you can get most anything you want to ask. In the absence of a knowledge of sales, I can form a judgment as to the value of the property only so far as I am in constant touch with people desiring vacant places for residences, stores and offices. My judgment is based on what the property can be sold for.

I based my $18,000 to $22,000 valuation on my general knowledge of the conditions in Negaunee. I took into consideration specific bids and offers, beside the one I mentioned. I considered the
371 offers for these lots between the Mitchell lot and the right of way as bona fide.

On July 21, 1914.

TOWNSEND, Recalled by Plaintiff.

Direct examination.

By Mr. Eldredge:

(Certain testimony of Ralph J. MacKenzie, to the effect that Mr. Townsend had offered to sell certain lands in Negaunee Township to him at $3.25 to $6.00 an acre, read to witness.) Mr. MacKenzie never made an application personally or by letter, to my knowledge, for the purchase or rental of any land. We never made any offer to MacKenzie or anyone else for sale of any land in the Eagle Mills flat or its vicinity. The Cleveland Cliffs Iron Co. owns 400 acres on the Eagle Mills flat, near Eagle Mills, being right around the Eagle Mills connection of L. S. & I. and D. S. S. & A. These lands are located in section 34, 48-26; for several descriptions, we paid $30 an acre, and for the balance $50; they are not for sale.

I never told MacKenzie, in any form, that I would sell any land of Cleveland Cliffs Co. at Eagle Mills, or between there and Goose Lake, or anywhere on Eagle Mills flat, at from $6.50 to $3.50 an acre and be glad to sell them. I had never had conversation with him on the subject of sale or rent. MacKenzie came to my office about a year ago, April 1913, said he was supervisor of Negaunee Township, and asked if we were satisfied with the previous year's assessment; I told him "yes." That conversation did not exceed three minutes, and that was all, relative to lands, that took place, to my recollection.

TOWNSEND.

Cross-examination.

By Mr. Wykes:

MacKenzie never came to see me about any Cleveland Cliffs lands, except this one instance, and nothing was said at that time
372 about the purchase of lands or as to what lands were worth; the lands appear on the assessment roll at from $3.00 to $25.00 per acre.

The 400 acres in section 34 is in part cut by the South Shore, which runs through three forties; and the others lie directly north. It is practically all cleared land, with no timber of value; the company purchased it about five years ago, in two parcels, one at $30, and the other at $50, per acre. One parcel included lands remote from Eagle Mills. The minerals were reserved. A half mile west of Eagle Mills, the Cleveland Cliffs owns a forty, having paid a thousand dollars for it and buying a lawsuit; I previously testified relative to this. It was the Maloney forty. We wanted the Eagle Mills lands for possibly a townsite purpose. The 400 acres run right up to the point

where the lines intersect at Eagle Mills. In the first two miles east from Eagle Mills, the Cleveland Cliffs owns nothing. East of there, along the north track, it owns approximately 200 acres. From two miles east of Eagle Mills, towards Marquette, the Cleveland Cliffs has large holdings; except for flowage rights of a small part, in connection with the Carp River Water Power, they are put to no use at present. The 400 acres at Eagle Mills was assessed for 1913 at $6.25 to $11.25 per acre.

373 On September 30, 1912.

WILLIAM E. MASON, a Witness called by Plaintiff.

Cross-examination.

By Mr. Wykes:

I have been local attorney for South Shore at L'Anse for a considerable time. Values along the road are increasing, and are considerably higher than 5 or 10 years ago.

There is land between red lines on Complt.'s Ex. 10, Riggs, not covered by tracks. The greatest distance between the red lines is about 1,200 feet; at that place, there are three tracks, a roundhouse, old depot grounds and a pole yard. At the lower part, toward the west, it is 1,000 feet between the red lines, and there are two tracks. The railroad uses the land for storage ground for forest products towed in along the old ore dock. The National Pole Co., the Nester Lumber Co. and others use that ground to store lumber, poles and bark, for shipment. I don't know whether they pay rent or not.

The old dock was rebuilt by village, under lease from South Shore. There are no tracks on the new docks, but are on old. To the south of the railroad grounds, on Complt.'s Ex. 10, there is no settlement; it is a forest plateau. I have owned it for a year; I paid $60,000 for entire tract, which consists of 160 acres immediately south of track, 400 or 500 acres of wild land a couple of miles back, from which the timber has been removed, and about 42 vacant village lots. That farther back is fair farming land, worth $15 to $20 an acre. The lots are 50 x 125 feet, and all in settled part of L'Anse; two are down in the flat and the balance on hills where residences are.

The lots are farther away from the settled part than the irregular tract devoted to railroad use. The two lots in the plat are in the business part, a store on one side and county buildings on the
374 other, and are among the best in the city.

There has been a gradual increase in values in Baraga. There has been a rapid increase in farming settlements along this part of the railroad in the last 3 or 4 years.

375 On September 30, 1912.

JOSEPH J. O'CONNOR, a Witness called by Plaintiff.

Direct examination.

By Mr. Eldredge:

The Blankenhorn farm, 60 acres of cleared land, is about 1 mile from the center of town; it sold several years ago for $8,000. Values have increased, and in my judgment it is now worth $10,000.

O'CONNOR.

Cross-examination.

By Mr. Wykes:

All L'Anse property has increased rapidly in value in the last six months. The lot that I spoke of in L'Anse sold for $300, in 1906; its ratio of increase has been 300 to 1,000. In the last year, the increase in general values has been 100% there, and there was a general increase along this strip.

O'CONNOR.

Recross-examination.

By Mr. Wykes:

Land values are increasing rapidly around L'Anse and in Baraga County, and have been for about 5 years. There is a greater demand for lands all through the county. There is more or less settlement and clearing going on all the time.

376 On October 1, 1912.

ARVO J. VITALI, a Witness called by Plaintiff.

Direct examination.

By Mr. Eldredge:

I have lived in Paynesville, Ontonagon County, for 4½ years. I sold out my mercantile business last spring, and am in farming and real estate now; have dealt in real estate for 5 years, both for myself and others. I am familiar with land values along South Shore, Sidnaw to Lake Gogebic, but no farther. I have brought over a hundred families of settlers to Trout Creek, Paynesville and Bruce's Crossing in the last 4 years, handling 4,000 or 5,000 acres.

On January 2, 1914.

VITALI, Recalled by Plaintiff.

Direct examination.

By Mr. Eldredge:

All the land in that territory around Kenton has increased in value in the last year.

Since I testified previously there has been more clearings and settlers. I am putting values as they apply at the present time. All the land along this territory has increased during last summer. It has been put in better shape—better improvements and better cultivated. Values have increased, since I testified before, on account of nearness to Paynesville and increase in the general value of lands, and condition of this particular land. Several houses are being built north and south of this land during the last year, and town has grown to about twice former size.

377 On October 1, 1912.

AUGUST HUTULA, a Witness called by Plaintiff.

Cross-examination.

By Mr. Wykes:

Land prices have been coming up fast.

378 On October 1, 1912.

AUGUST WALLEN, a Witness called by Plaintiff.

Direct examination.

By Mr. Eldredge:

I have lived at Ewen since 1891. In last 12 years, I have handled land and farmed. I have bought and sold 35,000 to 50,000 acres, and own 11,000 in the Upper Peninsula now, mostly in Ontonagon Co.

WALLEN.

Cross-examination.

By Mr. Wykes:

In 1891, they thought 50¢ an acre for cut-over land too high. Since then, there has been a steady increase. From Bruce's Crossing to Bergland, it hasn't gone up in the last 2 years, but east of there it has.

The cost of clearing cut over land is $15 to $60 an acre; $60 is heavy pines stump land or hardwood; that is exceptional, and you can't afford to add the full price to land value. The $15 kind is what has been burnt over, leaving hardwood and pine stumps. Now, there is brush and trees on it. Some of the big fires burned up the surface soil.

On January 3, 1914.

WALLACE, recalled.

Further cross-examination.

By Mr. Wykes:

I am quite familiar with values all through the 37 miles west of Trout Creek and the lands adjacent. Prices in that locality are going up; not so much for some years before as now. I have made more sales to actual settlers this summer than ever before. The prices are double those of 5 years ago, and a year ago they were higher than 4 years before that. There is a gradual rise. That is true all the way — Kenton to Topaz; west of there it is not so. The tim-
379 ber lands 5 years ago were about at the same price as at present. Through this 37 miles, there is more or less clearing and settling; people are moving in, new houses are going up, and the country is improving, in general.

The two miles out of Lake Gogebic, which I now value at $5 an acre, has increased in value since I testified before. It would be earier to sell that land at $5 now than at $4 when I was here before; $1 an acre is increase. Because the settlement is coming from Wakefield, they are building a county road, Tula to Lake Gogebic, opening up that country, the good lands along that line will be all right. I figure no increase in the $8 land I spoke of; there has been some increase in value in everything else—a gradual increase.

380 On October 2, 1912.

JOHN CAMPBELL, a Witness called by Plaintiff.

Direct examination.

By Mr. Eldredge:

I have lived at L'Anse 40 years. I have been in merchandising business all my life; have dealt some in real estate. I know the value of property in L'Anse and Baraga county.

CAMPBELL.

Cross-examination.

By Mr. Wykes:

Everything is on the raise in L'Anse and toward Keweenaw Bay.

381 On October 2, 1912.

ADOLPH W. PETERSON, a Witness called by Plaintiff.

Direct examination.

By Mr. Eldredge:

I have been in real estate and insurance business at Ironwood, Gogebic county, 17 years. I am familiar with lands along South Shore in that county.

PETERSON.

Cross-examination.

By Mr. Wykes:

In last 10 years, land values have gone up greatly, and timber values some. The farming industry is just developing, and proximity to Ironwood helped raise values. The increase in price of land along railroad has been general and gradual throughout this country.

382 On October 2, 1912.

JEROME BROWN, a Witness called by Plaintiff.

Direct examination.

By Mr. Eldredge:

I have lived at Matchwood 25 years—since 1887. They were then cutting the timber from the right of way and building South Shore. I first homesteaded some land, then logged 10 years, and since have farmed. Have owned 1,000 to 2,000 acres in Upper Peninsula. I was familiar with original character of land where railroad is; it was all mixed timber land. That was true from state line to Nestoria, except a small portion near Vermilac.

383 On October 3, 1912.

H. S. THOMPSON, a witness called by plaintiff.

Direct examination.

By Mr. Eldredge:

I live at Beacon, in the same locality as Champion. The former is the mine postoffice and the latter the station postoffice. I am assistant superintendent of the Oliver Iron Mining Co., in charge of Champion mine; have lived there 6 years, and am familiar with the property of South Shore.

For ½ mile each side of the station at Champion, the average value of right of way, simply as land, is $300 an acre, provided village remains as it is. The right of way (¾ mile) of the mine track into Bacon, serving Champion mine, is worth $60 an acre, simply as land, provided the village stays there.

From ½ mile east of Champion to Humboldt, land along right of way is worth from nothing to $15 an acre, simply for surface rights. Considering mineral rights, it is worth $100 an acre, though it has not been explored successfully. An absolute right of way in fee greatly impairs mineral value. In a hard ore formation, it would be necessary to leave a strip 1,100 feet wide to support a 100 foot right of way. A soft ore formation would not require so wide a strip.

From Champion to Michigamme, the right of way is worth $100 an acre, speculative value, straight through, as the first 3 miles west of Champion is in Michigamme slate formation and balance is in Ishpeming and Negaunee formation.

384 THOMPSON.

Cross-examination.

By Mr. Wykes:

Caving distance given simply referred to our mine, but I don't think it is general. Around Ishpeming, they are mining under railroad tracks in a small way. They are driving drifts and tunnels under, but not mining out a big room. The character of mining possible, and the distance from the track, depends on nature of the ore. There is no absolute rule. It depends on the depth of mining, whether the formation is vertical or perpendicular, and the strata of earth over the ore.

The ½ mile each side of Champion would not be worth $300, if not located in a village of 700. There is no plat; it is just an unrecorded map made by the mining company. The ½ mile each way would go beyond the edges of the settlement, as houses do not cover over ¾ of a mile.

Champion to Humboldt, ¾ of the land contiguous to South Shore is available for farming, and the other ¼ is swamp. It is worth from nothing to $15 an acre average; close to $15. There are no improvements of settlers there, close to the tracks. The soil is light and sandy, generally, though there is some good loam on the north side. You could clear that land for $40, and that would make it cost $55, which would be a good price for it. The iron formation in that section is in a basin of varying widths, and the space between the two formations at Champion carries possibilities. I fix the $100 valuation on the chance of discovery of ore. In my 6 years at Champion, I haven't known of any prospecting along South Shore, Champion to Humboldt, except within ½ mile of Humboldt, where the Breitungs have been drilling. I don't know of any sales along South Shore. Those lands are largely owned by corporations.

385 In 1905, land in sections 28 and 29, 48-29, sold for about

$100 an acre. I am not sure whether that was the same land that sold for $60 in section 29 or not, but it probably was not.

Right of way, Champion to Humboldt, is in the mineral formation. Only part of N. ½ of section 9-47-29 is in the formation. Neither the N. E. of S. E. nor N. W. of S. E. of 9 is in formation. The N. ½ of section 10-47-29 is in the formation, but the W. ½ of the S. E. ¼ of 10 is not, nor is section 28-47-29. Sections 28 and 29 of 48-29 are affected.

Champion to Michigamme is 8 miles. The first 3 miles is flat pine plains; after that it is rocky. That 8 miles is worth $8 an acre, average, for land, without reference to mineral value. Considering mineral possibility, it is worth $100 an acre. The Oliver Iron Mining Co. drilled on the odd sections through there, last March, but I don't know the results. Mineral possibilities would be on sections 30 and 31, 48-20. The last drilling was on section 21.

The purchase I spoke of, averaging $100 an acre, was the mineral rights on 4 forties, and the fee to 90 acres. Consideration was $15,500.

The Oliver Iron Mining Co. has large holdings through here, and Champion Iron Co. owns all of section 31-48-29, except the right of way of railroads; also most of sections 32 and 33. The Oliver Co. is the operating company; the Champion Co. is in the steel trust. I think these lands have a speculative value of $100 an acre, but do not think they should be taxed at that, as assessor cannot see that value.

386 I would sell the mineral and fee for $110, if I owned them, but it is a broad question when you ask whether I would pay that much. The value is sufficiently tangible so that I would ask that much for them, but not to be put on the assessment roll at that.

UNITED STATES OF AMERICA,
Eastern District of Michigan, ss:

I, Elmer W. Voorheis, Clerk of the District Court of the United States for the Eastern District of Michigan, do hereby certify that the above and foregoing is a true copy of Volume 1 of Narrative Statement of Testimony on Appeal, comprising typewritten pages numbered one to three hundred and eighty-six inclusive with a preface of nineteen typewritten pages embodying written notices, affidavits of service, designation of contents of appeal record, original exhibits to be returned and court's order in the therein entitled cause as the same appears on file and of record in my office; that I have compared the same with the original, and it is a true and correct transcript therefrom and of the whole thereof.

In testimony whereof, I have hereunto set my hand and affixed the seal of said Court, at Detroit, in said district, this twenty-first day of November, in the year of our Lord one thousand nine hundred and eighteen, and of the Independence of the United States of America the one hundred and forty-third.

[Seal of the U. S. District Court, Eastern District of Mich.]

ELMER W. VOORHEIS, *Clerk.*

387

Vol. 2.

On October 4, 1912.

A. E. DELF, a witness for the Plaintiff.

Direct examination.

By Mr. Butler:

I am Auditor of complainant. I have been employed by it since its organization in 1887, at the time of its organization as Chief Clerk in the Auditor's office; since 1894, as Auditor in chief charge of the accounts. I am and have been familiar with its accounts. They are kept in accordance with the rules and regulations of the Interstate Commerce Commission.

(Exhibits 25 to 30 inclusive, are various I. C. C. classifications, which are produced and introduced.)

(Complt.'s Ex. 31, Delf, showing road owned and operated by complainant, by years 1910-1912, produced and offered in evidence.)

(Complt.'s Ex. 32, Delf, showing revenue locomotive mileage by years 1910-1912, produced and introduced.) This is correct and the records, from which it is made, were kept in the regular course of business as prescribed by the I. C. C.)

(Complt.'s Ex. 33, Delf, being its revenue train mileage, 1910-1912, produced and introduced in evidence.) This exhibit is made from books, records, and papers kept in accordance with I. C. C. classification. The mileage of mixed trains is apportioned, 75% to freight and 25% to passenger regardless of number of cars or quantity of business in each class.

So far as my communications with other railroads have gone it is the general custom to divide, 25% to passenger and 75% to freight. I have made no special inquiry, but in my railroad experience these things have come up. The I. C. C. makes rulings upon its classifications; they are bound and published.

(Complt.'s Ex. 34, Delf, showing revenue and non-revenue passenger and freight car mileage, sub-divided, 1910-1912, produced and introduced in evidence.)

388 (Complt.'s Ex. 35, Delf, showing operating revenues 1910, 1911 and 1912, produced and introduced in evidence.)

(Complt.'s Ex. 36, Delf, divisions of operating revenues in Michigan as assigned by Complt.'s Ex. 35, between freight and passenger departments in Michigan for 1910, 1911 and 1912, produced and introduced in evidence.)

(Complt.'s Ex. 37, Delf, giving routes and compensation for hauling mail, July 1, 1907, to July 1, 1911, and from July 1, 1911, produced and introduced in evidence, later amended.)

Mixed train mileage: The division was 75% freight, 25% passenger. From 1894 to 1899 the I. C. C. on their blanks for report directed us to divide in that way. The commission has given no

instructions on the subject since 1899 that I know of. Accounting bulletin No. 8, of I. C. C. effective July 1, 1912, Case 102, Query:

"The classification of locomotive miles, car miles and train miles, makes no provision for the division of mixed train miles, between passenger and freight. Upon what basis should this division be made?

A. No. division between passenger and freight has been prescribed for mixed train miles."

(Complt.'s Ex. 38, Delf. Operating expenses of complainant for fiscal years ending June 30, 1910, 1911 and 1912, produced and offered in evidence.)

(Complt.'s Exs. 39 and 40, Delf, its reports to stock-holders for years June 30, 1911 and 1912, produced and introduced in evidence.)

There is no division between states in Complt.'s Exs. 39 and 40, Delf.

(Complt.'s Ex. 41, Delf, a statement of the method used in
389 dividing operating expenses between states and method of apportionment of Michigan proportion of expenses to passenger and freight business.) This is a statement of method and not of detailed figures, and the purpose is to determine the portion of operating expenses to be assigned to Michigan and to divide the Michigan proportion between the passenger and feight departments. (The Exhibits introduced in evidence.)

Lower half of Complt.'s Ex. 38, Delf, indicates the result of the application of the division of operating expenses between Michigan and the rest of the line as indicated on Complt.'s Ex. 41, under "method of division between states."

The percentages on Complt.'s Ex. 41, Delf, were applicable to the year ending June 30, 1910; the same method was used for all three years, the percentages, however, might vary somewhat depending upon the business of the various years.

Neither the I. C. C. or Michigan, requires a separation of expenses between states and neither prescribes a method for doing so. Minnesota, the only public authority requiring such division, instructed us to divide all operating expenses between states on a train mileage basis. They commenced a short time ago; I am not sure that they still adhere to it. I do not know to what use they put this assignment.

In 1910, 84.32% of the expense assigned to Michigan was allocated.

		Mich.	Wis.	Minn.
1910	Allocated	$1,612,717	$278,000	$20,554
1910	Assigned	299,847	57,495	594
1910	Assigned and allocated	1,912,564	335,525	21,148
1911	Allocated	1,591,937	288,679	10,919
1911	Assigned	312,301	64,866	636
1911	Assigned and allocated	1,904,238	353,545	11,555
1912	Allocated	1,671,596	320,367	7,699
1912	Assigned	326,317	68,539	640
1912	Assigned and allocated	1,997,913	388,906	8,339

390 The percentages allocated to Michigan were: 1910, 84.32%, 1911, 83.60%, 1912, 83.67%.

Complt.'s Ex. 41, Delf, also indicates the method by which the operating expenses apportioned to Michigan, are divided between freight and passenger business.

For the items divided on the basis of Michigan revenue train miles, I believe that is a fair and just method of making the division.

Since 1893 or 1894, the complainant has made a division of operating expenses between passenger and freight.

The purpose was to ascertain what we were doing in our freight and passenger business, as near as we could—the profit or loss. We only applied it to the traffic items at that time, we did not bring into it taxes, rentals and things of that kind.

The operating expenses were kept in accordance with the I. C. C. classification. I believe some classification of operating expenses by I. C. C. has been in effect since July 1, 1894.

The Interstate Commerce Commission required us to divide operating expenses between passenger and freight until in 1894, but since that time they have not required the division. During the time they required the division between freight and passenger they, by general instructions, prescribed a method for the division.

The method, generally speaking, was the revenue train mile basis used for the division of common expenses, and was the only one ever prescribed by any public authority so far as I know; the I. C. C. ceased to require it in 1894. I believe, however, the railroads have since, for their own purposes and information, continued to make such division. Our company has so continued.

In the operation of our railroad, passenger trains have precedence
on the right of way over freight trains. Freight trains are
391 required to side track and wait until the passenger trains
go by. The freight train is heavier and has more cars on the average, while the passenger train is faster. The outer rail is raised on the curves to accommodate the faster speed of the passenger trains, which adds to the safety of the track and is not necessary to the same extent for the slower trains.

Considerable company freight called "non-revenue freight" is transported over the road for the maintenance and operation of the property. No account is kept of the cost of hauling that business which is for the common benefit of both departments, but hauled by freight trains. No part of it is included in items allocated to the passenger department. It is hauled on regular freight trains more or less at all times through the year. Whatever the cost is, it is allocated to the freight business. No record has been kept and I cannot give any opinion as to the tonnage or amount. We could approximate the car loads—that would be all.

The greater part of the expenditure for operating expenses in the maintenance of way and structures account, is made necessary by causes other than wear — by weather.

For rails, the larger amount is due to wear and the less is due to weather; on such items as buildings, fixtures, water tanks, stations, platforms, wooden buildings, and structures along and in the track a considerable portion of the expenditure is due to weather and a por-

tion to wear. On items, such as fences, roofs of buildings, water tanks, etc., there is none due to wear.

I know of no way to determine the proportion of common expenses included in the general account "maintenance of way and structures," which is due to wear and which is due to other causes. Engi-
392 neers have attempted a method for making the division between wear and weather. I do not know whether they have discovered a method or not. A division has been made or assumed; I don't know how they got at the percentage assigned to weather.

Under the transportation expense account, the primary accounts, yardmasters and their clerks, yard conductors and brakemen, yard switch and signal tenders, yard supplies, expenses, yard enginemen, engine house expenses, yard, fuel for yards locomotives, water for yard locomotives, are all divided on the basis of ten per cent to freight.

That factor of division has been used by our company since 1893 or 1894, and I think fairly represents the proportion chargeable to each class of service. It is an estimate arrived at by consultation with operating officials, based upon their judgment. It would be difficult to arrive at division that is demonstratably correct—I think it would be quite impossible. The same crews, equipment and facilities do both classes of switching.

The following percentages of total Michigan operating expenses were allocated between freight and passenger: 1910, 68.76%; 1911, 69.74%; 1912, 68.65%. The amounts not allocated were assigned.

	Passenger.	Freight.
1910	47.74%	52.53%
1911	.....	.....
1912	.....	.....

(Complt.'s Ex. 42, Delf, showing tonnage statistics, produced and offered in evidence.)

Complt.'s Ex. 42, Delf, includes only freight hauled under tariffs for pay. During the last fiscal year (ending June 30, 1912), we kept separately the interstate and intrastate freight business statistics in Michigan; previously we did not separate them. The facts
393 are clearly stated on Complt.'s Ex. 42, Delf. In keeping separate the intrastate freight statistics, it is necessary to consider each way bill, and at times the items on each way bill separately.

Both classes may be on the same way bill and both classes—inter and intra state freight—are in the same train and in the same car.

I believe from the general character of the business that the relation between the intrastate and interstate freight business in Michigan is fairly constant from year to year, and that the relation of each to the total would be substantially the same in Michigan.

(Complt.'s Ex. 43, Delf, showing passenger statistics in Michigan, produced, and offered in evidence.) This exhibit was made up by me and under my instruction, and is true and correct.

In the case of interstate passengers moving partly within and partly without Michigan, the mileage assigned to Michigan is the

actual travel of each passenger in the state. For fiscal year 1912, we have kept the division of Michigan business between intrastate and interstate passenger business separately. The figures for 1910, 1911 and 1912, shown on Complt.'s Ex. 43, Delf, we worked up separately. The figures shown are the actual figures as to the things purported to be shown.

(Complt.'s Ex. 44, Delf, showing freight statistics of complainant, produced, and offered in evidence.)

Ore hauled to complainant's docks is all destined and billed to points outside Michigan by water; our haul is entirely within the state. Our charge is only made to our docks wherever it goes. This business though handled on a local rate is in fact interstate business.

394 Complainant hauls iron ore from the Ishpeming and Negaunee district to points other than the docks at Marquette (E. G. Newberry, Mancelona, Cadillac, and Elk Rapids, Michigan), that I have classified as intrastate freight. We also haul some iron ore by rail to points in other states; that is classified as interstate freight. The only iron ore classified as such on Complt.'s Ex. 44, Delf, is that hauled from the Ishpeming and Negaunee district to the ore docks at Marquette, classified by me as interstate commerce. Other interstate iron ore is included in other interstate statistics of Complt.'s Ex. 44, Delf, but not separated as between commodities. Nothing is done with the ore at Marquette except to transfer it from the cars to boats by means of the dock.

(Complt.'s Exs. 45, 47 and 48, Delf, showing gross and net operating revenues, operating expenses, etc., in 1910, 1911 and 1912 respectively, produced and offered in evidence.)

The statements (Complt.'s Exs. 45, 47 and 48, Delf) are made in accordance with the I. C. C. classification as to definition of items, from data regularly kept and they are true and correct. Revenue and expenses are divided between freight and passenger, according to exhibits heretofore introduced in evidence in connection with my testimony. Hire of equipment, interest, joint facilities, taxes, rents paid (joint facilities), rents paid (miscellaneous) and separately operated properties (Mackinaw Trans. Co.), are divided between freight and passenger on the basis of income, which is for 1910, 66.90% freight, and 33.01% passenger.

In arriving at the estimated loss by the application of Act 276, of $178,234.21, I estimated that the loss on that class of business in 1910, would be the difference between the rate of 2.563¢ and 2¢ or 5.63 mills per passenger mile. I estimated there would be no greater amount of traffic under the two than under the three cent

395 rate.

For the exception of travel of distances of 5 miles or less where three cents may be charged, I made figures for 1912; the number of passengers 5 miles or less for year ending June 30, 1912, was 56,541, the revenue was $5,477.35, and the one-third excess over two cents a mile was $1,825.78.

To offset this amount I have made figures for children traveling at half fare based on two months' business, Dec. 1911 and June 1912. This applied to the year 1912 indicates an aggregate reduction below two cents per mile amounting to $1,821.33 on entire business, $1,-324.31 on intrastate and $498.22 on interstate business.

Referring to Complt.'s Ex. 43, Delf, showing the average haul on intrastate passengers for 1910 to be 31.18 miles, and average revenue per passenger per mile to be 25.63 miles; the saving to the passenger by the two cent rate would have been 5.63 mills on each mile travelled or 17.5 cents per passenger in 1910 and about the same in 1911 and 1912.

In the passenger mile statistics I have given, children's half fare travel is treated as full passenger miles without distinction between full and half fares. Persons travelling on passes are not included. In arriving at the average amount per passenger I divided the total revenue received for transportation of persons by the total passenger miles arrived at as described.

Leaving out the trips of five miles or less it would be impossible to get an average of two cents per mile if any children travelled at half fare. In arriving at the average haul, interstate passengers for 1910, 143.46 miles, average revenue per passenger mile 25.18 mills, for 1912, 128.79 miles, revenue per passenger mile 24.58 mills, 396 the passenger miles include only miles actually travelled in Michigan. If the entire interstate haul had been taken, the average haul of interstate passengers would be higher than stated on Complt.'s Ex. 43, Delf.

Revenue from passengers (page 3, Complt.'s Ex. 45, Delf) includes intrastate and interstate, actually arrived at.

Excess baggage, mail, express and other passenger train revenue, special train revenue, station and train privileges, telegraph service, rent of buildings and other property, miscellaneous, joint facilities (Bal. cr.) outside operations (sleeping and dining cars), hire of equipment, interest, rents received, joint facilities and miscellaneous income, were all treated as common and separated to inter and intrastate passenger on a percentage relation of revenue from passengers for 1910, of 56.39% to intrastate and 43.61% to interstate.

The passenger operating expenses were equated at 115%. That means it is assumed that it costs 15% more to do the intrastate passenger business than to do the interstate passenger business.

Complt.'s Ex. 46, Delf, shows the method of dividing on the equated passenger mile basis. This method is as follows:

"You take the intrastate passenger miles and increase it by 15%, and take the interstate passenger miles as they are, without increase; you add the interstate passenger miles so increased to the interstate passenger mile and take a total and then ascertain the percentage of intrastate passenger miles so equated to the total, and of the interstate passenger miles to the total, to such total, equated total, and then apply those percentages to the total passenger operating expenses in the State, for the figures which are shown on the third sheet of Complt.'s Ex. 45, Delf."

397 The taxes, rents paid (joint facilities, miscellaneous and separately operated properties) were divided on the revenue basis of 56.39% intrastate and 43.61% interstate.

They are then added to the operating expenses and the total deducted from the gross passenger income showing total net income for 1910 of $270,097.49; intrastate net income $134,118.35; and interstate net income $135,979.14. Deducting the estimated loss of $178,234.14, leaves for the whole passenger business in Michigan $91,663.28, and deducting the estimated loss on intrastate and interstate business from intrastate and interstate net income, leaves $30,757.42, as net income of intrastate business, and $61,105.86, as net income from interstate business, after allowing for the estimated loss. (Objection to testimony as to loss, on the ground that it is purely speculative, and assumes that the traffic would remain the same under the reduced rates, which is assuming a condition without precedent and which cannot exist.)

On Jan. 8, 1913.

DELF, recalled.

Direct examination resumed.

By Mr. Butler:

(Complt.'s Ex. 52, Delf, showing estimated loss due to the two cent passenger fare, produced and offered in evidence.)
Complt.'s Exs. 45, 47 and 48, Delf and re-dividing certain items Complt.'s Exss. 45, 47 and 48, Delf, and re-dividing certain items listed therein, between freight and passenger business on different bases than in original exhibits, produced and offered in evidence.)

Item: Outside Operations (sleeping and dining cars $5,606.54) Complt.'s Ex. 45, Delf, is a net item. The details are:

398

1910.	Revenue.	Expense.	Net.
Sleeping Car	$25,803.21	$14,060.06	$11,743.15
Dining Car	26,365.35	32,501.96	-6,136.61
Total	$52,168.56	$46,562.02	$5,606.54
1911.			
Sleeping Car	26,262.23	14,548.14	11,714.09
Dining Car	28,095.75	33,473.62	-5,377.87
Total	54,357.98	48,021.76	6,336.22
1912.			
Sleeping Car	26,685.83	17,506.87	9,178.96
Dining Car	29,908.08	37,673.56	-7,765.48
Total	56,593.91	55,180.43	1,413.48

There was a great deal more expense in repair of sleeping cars in 1912, and sleeping and dining car expenses increased.

(The Complt.'s Ex. 53, Delf, being Railroad and Census Statistics for the Upper Peninsula for 1910, produced and introduced. Complt.'s Ex. 54, Delf, being a statement of operations and of resources and disposition, 1887 to 1912, produced and offered in evidence.)

The D. S. S. & A. commenced operating a railroad Jan. 1, 1887. I have been in the accounting department since its organization, in charge since 1894.

Column, "gross earnings" includes only operating earnings according to I. C. C. reports prior to 1908 and to classification 1908 to 1912, except that revenue from sleeping and dining cars is included. The column does not represent exactly the same thing all the way through, but very closely the same. It corresponds with the requirements of I. C. C. in force at different times.

Column "operating expenses," prior to 1908, included rentals of equipment, which are since included in "other deductions from income." That column is set up in accordance with the
399 I. C. C. classification at the time, except the inclusion of expenses of sleeping and dining cars as noted.

Column "other income" is made up of rentals received, dividends and miscellaneous items, being all receipts from sources other than income.

Column "total income" is sum of "net earnings" and "other income" and is total from all sources, less operating expenses.

Column "taxes accrued" is taxes actually paid, except for fiscal year 1912, where amount is estimated from previous years' taxes.

Column "interest on bonds" is interest accrued.

Column "other deductions from income," 1887 to 1880 all payments were dividends of M. H. & O. stock guaranteed by complainant. These dividends ceased in 1890 when complainant purchased the M. H. & O. 1891 to 1907 the payments were largely interest on unfunded debt, on car trusts and miscellaneous; 1908 to 1912 the amount was in accordance with I. C. C. classification, consisting of interest on unfunded debt, car trust, miscellaneous interest, rentals, separately operated properties, expenses of Mackinaw Trans. Co., company's bad accounts written off, loss on track and buildings abandoned and depreciation that accrued prior to July 1, 1908, on equipment destroyed in current period.

In each instance the depreciation was that which accrued prior to July 1, 1908, but was not charged off until the equipment on which it had accrued was put out of service.

Prior to Jan. 1, 1887, the existing lines of railroad now owned by South Shore were Mackinac and Marquette, successor to Detroit, Mackinac and Marquette, for the line St. Ignace to Marquette, and constructing or about to construct Soo Junction to Soo, the Sault Ste. Marie and Marquette, the Wisconsin, Sault Ste. Marie and
400 Mackinac and the Duluth, Superior and Michigan Railways. I do not believe the latter three had any line. Our records

give no information with regard to them. Our company did not become possessed of the records of the companies to which it succeeded; we haven't the construction records, accounts showing cost of road, or anything of that sort. In 1887 upon organization the D. S. S. & A. leased the M. H. & O. whose line extended Marquette to Houghton. The roads thus consolidated and leased formed a line from Sault Ste. Marie and St. Ignace to West Superior, Wisconsin, and from Nestoria to Houghton, as finally completed.

In 1890, the lease from the M. H. & O. to D. S. S. & A. terminated when the D. S. S. & A. purchased all the property of the M. H. & O. including the stock of the Marquette and Western road, Marquette to Ishpeming. This was done through purchase of M. H. & O. stock; that corporation still exists.

There was an intermediate organization—the D. S. S. & A. syndicate—which collected the property together and transferred it by articles of consolidation to the D. S. S. & A.

These other companies, though they didn't build any road, had some land grants on conditions or something of that sort. The D. S. S. & A. became possessed of certain granted lands other than those used for operation, in substantial quantity, through purchase of the M. H. & O. It has disposed of some lands and still has some. The proceeds of land disposed of appear on sheet 1, Complt.'s Ex. 54, Delf, in column "other income." There are some substantial amounts in 1909, $146,000; 1911, $249,000. Of the latter amount $193,507.82 is proceeds of the sale of those lands.

The larger part of the 1909 amount was dividends from Western Express Co. stock formerly owned by complainant, but now sold.

I have not the details of the items 1909 to 1912 "other in-
401 come"; they don't show in our books, they are made up of numerous items.

Capital stock of $22,000,000 was issued about the time of complainant's organization. $22,000,000 of stock and $4,000,000 of 5% first mortgage bonds were given for the road as it stood in 1887—the consolidated property, that east of Marquette and some west of Nestoria, which was under construction. It was being built by the D. S. S. & A. Syndicate—Calvin Bryce, Hugh McMillan and I think James McMillan and others were interested.

The consolidated mortgage 4% bonds $15,107,000, were authorized at one time and issued at various times.

The times of sale and prices were as follows:

Date.	Amount sold.	Price.
Dec., 1892	$11,000,000	82½
May, 1893	1,067,000	82½
June, 1893	533,000	82½
	12,600,000	10,395,000

Dec. 1892, $2,000,000 delivered to C. P. R. in consideration of its guaranteeing interest on entire issue. January, 1895, $323,000 issued to retire M. H. & O. 6% bonds for same amount. December, 1896, $53,000 issued to retire D. S. S. & A. 5% bonds for same

amount. September, 1897, $78,000, issued to retire D. S. S. & A. bonds, same amount. November, 1897, $53,000, issued to retire D. S. S. & A. 5% bonds same amount. Total $15,107,000. Total $15,107,000 now outstanding.

The D. S. S. & A. 5's retired ($184,000) are a deduction from the total amount of the issue $4,000,000.

M. H. & O. bonds $4,856,700, were first mortgage bonds outstanding when complainant purchased the road. Some of them ($1,077,000) are still outstanding. Income certificates $3,-
402 000,000 4's, issued Dec. 31, 1892, to retire other obligations. No interest has ever been paid on these—they are obligations outstanding. There is no interest to be paid on them unless it was earned over and above other interest. Car trust obligations represent equipment notes. Total income: the caption "Disposition" shows what was done with the resources.

Item, road and equipment, $47,182,526, is the total amount in securities of the company paid for the road and includes additions, betterments and extensions.

The reserve for accrued depreciation in amounts charges to operating expenses to cover depreciation on equipment and ore docks.

The South Shore Land Co. stock is $3,000 all owned by complainant; it owns the lands on hand of the old land grant, and being sold from time to time; that company is managed by officers of complainant.

For six years prior to 1910 the D. S. S. & A. ran its through trains from Houghton to Calumet—through passenger trains, and also some through freight trains from Houghton to Calumet, over the Mineral Range Railroad, and charged the Mineral Range railroad a rental for the equipment, locomotives and cars which constituted the trains, and the latter part of 1909 and the early part of 1910, the Mineral Range Railroad Company protested against that, claimed that it was an injustice to them to charge them that rental, that they didn't get a dollar back for what they were required to pay, and the D. S. S. & A. railroad company agreed with them—agreed to refund the six years rental that had been charged them on that equipment.

403 "The Master: Was that a gratuity; were they under any obligation to refund it?

A. No, except that it was an injustice to charge it in the first place, it was so considered by the officials of both companies."

In addition to that rental the Mineral Range paid part of the operating expenses of the trains. The South Shore owns 53% of the Mineral Range stock. The officers of both companies are practically the same. The minority stockholders raised the question as to whether these payments of rental of equipment were right, and the refund for those 6 years, aggregated $48,399.44. The amount of refund appears in column 8, "other deductions from income, 1910," no part of it was included in operating expenses.

Loss on tracks and buildings abandoned. This appears in "other deductions from income," 1910, 1911 and 1912.

Depreciation prior to June 1, 1907, appears in "other deductions from income."

First mortgage 5% bonds retired, appears in item $15,107,000 M. H. & O. bonds retired. Appears in same item under "resources."

Car trust obligations retired, appears in same item under "resources."

I have not seen complainant's bonds listed in Market reports for a long time. The interest has been regularly paid on M. H. & O. bonds and first mortgage 5% bonds. Interest on consolidated mortgage 4 per cent bonds is in default. I think there was a small payment in 1912. The record shows. Paid interest 1887 to 1912 by years, a total of $12,631,201.90. The interest was paid in full 1887 to 1891. Since that time there has been default of interest each year.

404 I believe the M. H. & O. bonds, first mortgage 5's outstanding are held generally by the public. The consolidated mortgage 4's are all held by C. P. R.

In 1892, $2,000,000 of this issue was given C. P. R. in consideration of its guaranteeing the interest on the entire issue. In 1912 we paid $100,000, and in 1911, $150,000, and in 1910 nothing as interest on consolidated mortgage 4's. I have not the records back of that.

The majority—about 51%—of complainant's stock is held by C. P. R. I don't know where the rest is held.

(Complt.'s Exs. 35*a*, and 36*a*, Delf, being joint facility items, 1910-1912, produced and offered in evidence.)

(Complt.'s Ex. 55, Delf, being operating income and maintenance, and tabulation of operating expenses and taxes of various railroads for various years, produced and offered in evidence.)

I am familiar with the trackage of complainant in Michigan allocated by Riggs as freight tracks on which freight trains alone move, and the yard tracks in Michigan on which both freight and passenger switching is done. I have given attention to the relative cost of maintenance, of such freight and yard tracks and the cost of maintenance of other tracks, principally main line.

From inquiries of the general superintendent and road masters, it does not cost over one-third as much per mile to maintain those tracks as it does to maintain main line tracks. (Objection to the testimony as hearsay.) Independent of inquiry, I know it does not cost as much to maintain those tracks—there is very little maintenance put on them.

In my opinion, independent of inquiry, it does not cost over one-third as much per mile. The accounts do not show the
405 difference in cost. The freight branches and side tracks are not maintained to the same standard that main line tracks are; the use, especially of exclusive freight tracks, is not nearly so great. It would be difficult to state the proportion of use. Different tracks have different degrees of use. This is true also of main line. The traffic is more dense on parts of the main line than on others. Freight tracks to serve mines while used occasionally during the

season of closed navigation, are subject to relatively small use during four or five months, which makes a great deal of difference in maintenance.

DELF.

Cross-examination.

By Mr. Wykes:

In my opinion, Mr. Riggs was wrong when he stated that the degree of maintenance on some mine tracks, spurs and branches, to mines, was as good as on main line. I have been over the tracks more or less, but not for the purpose of inspecting them; I have lived among them all my life and from general observation, know their condition and how they compare with main line.

I have had no experience in maintenance department; I was in the station service for some years; my business has been confined to accounting for 25 or 30 years. I cannot separate the accounts so as to say what money is spent on a particular spur; we do not do it. The passing track is not maintained in as high a state of efficiency as the main line which is used by both services—passenger and freight. Sidings in common use—freight and passenger—would be maintained in the same state of efficiency as those exclusively freight.

There is no way to give separately the income from property used exclusively for freight, and I have no judgment as to the proportion that the income would bear to that of the system as a
406 whole. The freight charge covers the entire service. The mines are classified in to two districts, all in a single district having the same rate.

The mines in a particular district are of varying distances from the main line. The furtherest mine in the Ishpeming and Negaunee district is at least one and a half mile- from the main line and gets the same rate as mines located close to the track.

In selecting the roads for Complt.'s Ex. 55, Delf, I considered that they were roads to a great extent in about the same territory and operating under similar conditions, as complainant. There are other roads other than complainant's in the Upper Peninsula, but I could not get complete reports of all of them; I included no road in Michigan other than complainant and the Wabash.

I do not know even in a general way, what other roads show.

Annual reports are not all compiled in the same way, and the figures in the report, of one road, would mean one thing and in the report of another road another, and to put them together in comparison wouldn't be a proper comparison so I took the reports that were made up in about the same form to make this report from. I tried to get some other roads into this but I was obliged to drop them.

Complainant's capital stock $22,000,000, and bonds $4,000,000, were the consideration for purchase of the railroads at the time of D. S. S. & A. consolidation in 1887. I don't know the value of these. The item "road and equipment $47,000,000 is a price for

the road fixed by the amount of capital stock and bonds then issued, rather than the value. I do not know that C. P. R. paid for this stock. (Complt.'s articles of consolidation produced and marked Defts.' Ex. 12.)

407 The D. M. & M. was a land grant road. My understanding is none of its lands went to consolidated company; I think separate land company was organized and the lands retained by it. Complainant acquired M. H. & O. in 1890, by acquiring almost the entire capital stock; I understand the M. H. & O. still holds regular annual meetings.

In July, 1890, lease from the M. H. & O. to the D. S. S. & A. was abrogated, and at the same time the D. S. S. & A. purchased all the property of the M. H. & O. including all the stock of a road called the Marquette & Western railroad running from Marquette to Ishpeming. When the South Shore acquired the M. H. & O. the stockholders of the M. H. & O. authorized its officers to transfer the road to the South Shore on certain terms, which included the assumption by the South Shore of all the debts of the M. H. & O. Company and an agreement by which for each share of preferred and common stock, the holders thereof were to receive, if applied for within a certain time, a certain sum in cash.

In 1890 at the time it was acquired by the South Shore the M. H. & O. still owned its land grant lands and they came to South Shore. Later the South Shore Land Co., with $3,000 capital stock, was organized in 1898, and the lands deeded to it. The officers of that company are practically the same as the officers of South Shore and the proceeds of land sales from time to time are carried into South Shore accounts. Complainant owns all the South Shore Land Co.'s stock. At the time the M. H. & O. was taken over by complainant, the land grant lands left were about 87,000 acres. The net income, from that time to the present, has been about $193,000. The complainant held the lands 8 years at least, I think it has sold some directly, at least it has sold some timber. The amounts re-

408 ceived for that would be in addition to the sum already stated. The figure $193,000 referred to the South Shore Land Co. operations. In the neighborhood of 70,000 acres of land might still be remaining.

Complt.'s Ex. 53, is taken from population of the entire Upper Peninsula, much territory in the Upper Peninsula is not tributary to the South Shore. The principal cities of the Upper Peninsula are Sault Ste. Marie, Marquette, Negaunee, Ishpeming and Houghton on South Shore line and Calument, Escanaba, Gladstone, Manistique and Iron River, not on South Shore line. It is not possible to say just what territory is tributary to South Shore and what is not. If I had taken the counties through which the South Shore runs, it would have produced different figures from those on Complt.'s Ex. 53. The towns named are reached by different railroads.

In Complt.'s Ex. 52, Delf, in figuring the loss due to two cent rates, I have assumed each year the same business as was actually done, and that the rates would go to a flat two cents.

The dining car service shows a loss for 1910, 1911 and 1912. The dining cars are owned by the South Shore, being (1910) two diners and two or three combination cars. The combination cars have chairs with an extra charge for seats.

In 1912 there were four diners and two combinations. The loss in that business is the difference between cost of the service and the revenue from it. The cost of service includes repairs and depreciation of dining cars, supplies and services of employees. In case of combination cars it is all charged up as dining car.

All parlor car fares go into the dining car revenue; the loss is in part for chair car service to which passenger on ordinary ticket, at 2¢ or 3¢ is not entitled, without extra payment. All passengers are entitled to dining car service upon paying for the meal.

409 Our revenue train mileage is stated in our exhibits, includes mileage made by our trains and C. N. & W. trains hauled by us, Houghton to Calumet. We ceased to carry mileage made on the Mineral Range in our revenue train mileage, Oct. 1911.

Neither our revenue train mileage or revenue locomotive mileage, includes any switching mileage. In term switching mileage, we follow I. C. C. classification; the uniform method of counting miles of switch engines is to calculate six miles to the hour regardless of how many the engine runs. The train and car mileage are actual.

We try to be quite critical to see that the entire cost of new construction is charged to the account of a particular station. This does not include transportation, of men and materials, or engineering, superintendence or supervision. If an engineer was put on a piece of work for a considerable time, that cost would be charged to it.

This is the practice, though it is an entirely new structure. We endeavor to get all the cost of material or workmen on a building charged to *to* it, but are so particular as to superintendence and things of that kind. So far as the cost involves additional expense over the general current expense, we seek to get it into the particular item of property.

We cannot divide the train mileage up into the different portions of the road so that I can give a statement of the train mileage on tracks not used in the passenger business. On track mileage that Mr. Riggs located to freight, practically none of our train mileage is computed; switching mileage is made on that. The train mileage is made almost exclusively on the trackage operated jointly by the freight and passenger service. Not one per cent of the train mileage is made on tracks used exclusively in freight business.

410 On exclusive freight track mileage, the expense of Maintenance is less than on the main line mileage.

On Complt.'s Ex. 41, Delf, under maintenance of buildings fixtures and grounds, 96% was actually allocated to Michigan; this includes all the expense of the Marquette shops. Those shops are used to keep in repair and rebuild equipment used on the entire line. I don't make any separation to the repairs that Wisconsin got from those shops. The locomotives are overhauled, repaired and rebuilt in the machine shops at Marquette, and those expenses are allocated to

Michigan in the same way. We have no extensive shops anywhere on the line other than in Michigan. A small amount of repairs might be done at Thomaston, a very little at Superior, Wis. We have no shops there; some car repairs are made at Superior by car repair crews. We have car repair crews along the line in Michigan; at the terminals St. Ignace, Soo, Houghton, and at various points where cars might require repairs. The only repairing done outside Michigan is at Superior. In 1910 the expense was maintenance alone; in 1911 maintenance and replacement of the shop that burned, which was charged to operating expenses.

The expenses of Mackinaw Trans. Co. are divided on the basis of the revenue which the owning companies have earned on their rails on freight business. This is because the revenue from passengers is first deducted before dividing the expenses. There is a charge of 50¢ per passenger for coming over the Straits which goes to the Mackinaw Trans. Co.

That *it* subtracted from the total operating expenses and the balance is divided between the companies on the relation of the freight earnings. The revenues used in dividing the Mackinaw Trans. Co.,
expense are the entire freight revenues of the participating
411 companies from the business crossing the Straits.

Outside agencies consists of agencies in connections with the traffic department and located off our line, e. g. at Pittsburgh, New York, Boston and Ashland—agencies that are working to secure traffic on our line. In various eastern cities where the C. P. R. has agencies they represent us and we pay a portion of the cost. It is a joint agency for the purpose of directing and securing business to pass over our line. In 1910 the outside agency expense was $55,977.24, which included commissions paid to agents in various territory adjacent to our line, for selling tickets.

In Calumet, Marquette, Houghton, Negaunee, Hurley and Ironwood, saloon keepers and men in stores are in touch with the foreign population and sell tickets for which we pay them a commission; that is charged to outside agencies. There is also some payment to agents of the G. R. & I. and P. M. Charges for outside agencies were assigned to Michigan, apportioned to passenger, and divided to intrastate and interstate on equated passenger mile basis. The divisions being as follows:

	Total.	Michigan.	Passenger.	Interstate passenger.	Intrastate passenger.
1910	$55,977	$46,686	$33,966	40.64%	59.36%
1911	59,242	49,113	37,170	36.58%	63.42%
1912	61,959	50,929	37,811	33.20%	66.8 %

We used the proportion of business done in each department of interstate and intrastate, equated by the addition of 15% to the intrastate passenger business, in making the division of outside agencies between inter and intra state passenger business, but did it by an arbitrary basis applying the 15% extra cost to the intrastate business. I don't think that by examining the vouchers it would have been

412 possible to locate parts of the expenses as between inter and intra state passenger. In a few instances it might have been possible. So far as commissions are concerned our accounts show the ticket and the routing on which the items of commissions are paid. So far as a particular outside agency is concerned our records do not show the business that came to our line from that office.

The expense is composed in part of rent of offices in Pittsburgh, New York, etc., and salaries to agents, etc., including advertising, if any.

As to the plan or formula of Complt.'s Ex. 41, Delf, we have been making divisions on that basis 18 or 20 years in our office, except that we did not divide between states until we came into this case.

We have not divided on our books between passenger and freight; we have made up statements separating between them for 18 years. They are not submitted to any one, we just keep them as a matter of record and information ourselves.

We did not use those statements in making Complt.'s Ex. 41, Delf; the results of previous divisions would vary some from the results in Complt.'s Ex. 41, Delf. I never investigated to see how much. We endeavored to make entirely new allocations and to be more particular in compiling Complt.'s Ex. 41, Delf, than in making those other statements. There was change of method in some instances.

The report of the apportionment of our expenses in our 1910 report to the Michigan Commission, was on a still different basis. There was a difference of some $17,000 in the Michigan expenses between that and the present assignment in the division between states.

Complt.'s Ex. 41, Delf, to a considerable extent was the method of apportionment of expenses used in the Minnesota Rate
413 Cases, though the formula used is not the same. I could not point out the differences. Complt.'s Ex. 41, Delf, is a combination of the information from the Minnesota Rate case, and our previous practices; it is my judgment of a method of division of operating expenses based on our practices and conditions and the Minnesota Rate Case. I have not the Minnesota Rate Case in mind, so I cannot make or name any definite item of difference or similarity. I do not recall how, but our method seemed more accurate and to make a better division.

The Master: You spoke of some different conditions obtaining on your road, can you specify any of those conditions?

A. Our road runs practically into only two States. The roads in Minnesota run into a number of States and are much more complex as to States than ours. We run directly from one State across the line into another. They have branch lines running into several states. It is much more difficult for them to make the division between states than it was for us having a single line running directly from one State into another.

Certain switching expenses, including yard expenses were assigned 10% passenger and 90% freight. The ratio is arbitrary representing about the proportion of service assignable to each class of business. We have used that basis for 18 years, it being fixed by my

predecessor. I do not know what he based it on, but our general superintendent says it is fair, so I have continued it. It is difficult to get at the switching movement of freight and passenger trains. I do not know whether if gotten at, it would produce the same percentages. A passenger train does not require as much switching as a freight train; the cars are assigned to particular trains and run in those altogether in passenger service. In freight service
414 trains are made up of cars that come in, or are loaded, from different points and the entire number of cars necessary to make up a train are put together by switching service each time a train is made up.

I presume the reason for decreases in freight train miles 1912 under 1910, is decrease in traffic, though I find the average number of freight cars per train has increased; it was: Passenger, including all passenger train cars, and freight train cars per train mile:

Year.	Freight.	Passenger.
1910	16.94	4.39
1911	18.18	4.43
1912	18.68	4.52

It would be possible by increasing the number of cars in a freight train to do the same amount of business with a less number of train miles. Increasing the number of train miles in the freight department, the passenger train miles remaining the same, would draw a greater amount of expense to the freight department (or vice versa) if you used the revenue train mileage basis to apportion expenses. The integrity of this basis varies with the make up of the trains.

The Mackinaw Trans. Co.'s loss was: 1910, $27,213.61; 1911, $19,832.17; 1912, $30,020.28. Those are deducted in reaching final net income results; a part of the loss is assigned to intrastate passenger business. The loss stated is the final proportion of the D. S. S. & A., which pays 40% to 50% of the total, being based upon earnings from our freight business passing over the ferry. We divide our loss with the Soo Line. Their earnings and ours go in in arriving at the earnings west of the Straits and expenses are then subdivided between us and the Soo Line on the basis of our earnings and theirs.

415 The loss is the expenses of the ferry with no compensating revenue to offset it. The freight income from the ferry is so small as to be negative; there is a little local business Mackinac to St. Ignace; it would not amount to .1% of the total.

The only income of the Mackinaw Trans. Co., outside of the little from local business is for carriage of passengers at 50¢ each, and mail and express.

I cannot give the income from freight of Mackinaw Trans. Co. as there is none, except as it enters into the through rate. There are no statements by tonnage or by cars.

The three companies participating in the M. T. Co. could not exchange business between each other if they did not have that facility; they could not get along without it.

We receive and receipt for the business over the ferry at St. Ignace. The other companies receipt for the business from the South Shore at Mackinaw City.

St. Ignace is really the initial terminal on our line. It has to be re-distributed at St. Ignace if there isn't enough freight in the car to go along, and that re-distribution is made by our company.

Western Express Co: Previous to 1909 complainant and the Soo Line each owned one-half of its stock. In 1909 complainant sold to the Soo Line; the C. P. R. owns the controlling interest in both Soo Line and complainant.

The capital stock was $50,000. The South Shore had always received 45% of the earnings of the express company over its line. On 13 express companies reporting to the I. C. C. for year 1910, the average paid the railway companies was 49% plus.

When the South Shore owned the stock of the express company there was a minimum guaranty of $3500 per month which
416 does not now exist. The proceeds of the business fall below that guaranty.

Legal expenses as shown in the operating accounts were:

Year.	Entire line.	Michigan.
1908	$5,641	$5,186
1909	5,647	.....
1910	6,210	5,186
1911	6,049	4,988
1912	27,846	26,266

The expenses of this case, not including the time of Mr. Eldredge, Mr. Walker, or other men who assisted in the litigation, other than experts and attorneys, was for 1912 $19,083, all of which was charged to passenger department, and 66.8% to the intrastate business on the equated expense basis.

The Mackinac Trans. Co. expense is all allocated to Michigan.

The 15% with which the intrastate business was equated, has been applied in the division of baggage, express and mail expenses, being spread over all the intrastate business.

The intrastate passenger business is becoming more dense every year; a steady increase from 1910 to 1912. The interstate has decreased. The ratio of operating expenses to income on the intrastate business as shown by my assignments, has increased.

	1910.	1911.	1912.
Operating ratios on intrastate passenger business as arrived at by Delf.....	67%	72%	78%
On interstate passenger business as arrived at by Delf..	59%	65%	72%
On total business in Michigan	....	....	....
Rates per passenger mile....	2.563¢	2.558¢	2.604¢
Interstate passenger miles...	14,454,301	13,031,225	11,484,564
Intrastate passenger miles...	18,358,957	19,645,802	20,090,114

417 The usual rule is that, other things being equal, the more dense the traffic, the less the operating ratio. I do not know why that rule is not borne out in this instance.

Operations of Mackinaw Trans. Co. have always shown a loss.

	Dining cars, No. of meals.	Passengers carried entire line.	Seat fares, Michigan.	Average haul.
1910	37,550	719,169	7,792	55.80 miles
1911	37,289	785,622	8,498	50.26 "
1912	38,179	790,239	7,973	47.65 "

Total cost of Soo Union Depot property including all buildings and grounds to June 30, 1911, was $117,812.11; the passenger station cost $29,845.52; water supply $2,060.44; heating plant $7,762.62; the emigration building $2,622.95; the sewer $3,668.79; miscellaneous $1,365.38. These are costs to Union Depot Co.

The northbound less than car load freight coming across the straits, is loaded as far as possible by the Michigan Central railroad at Detroit and Junction yards, with reference to the D. S. S. & A. freight, all in one car, and it — sealed and comes through across the straits to St. Ignace under seal. The same is true of the freight loaded by the Grand Rapids & Indiana Railroad destined to points on or via the D. S. S. & A. and loaded at Grand Rapids and Ft. Wayne. They load less than car load freight and the cars to and through St. Ignace under seals, it is there checked by our force, rearranged and re-loaded if necessary into west-bound cars on the D. S. S. & A. or cars going via the D. S. S. & A. and the Soo Line. North bound less than car load freight, is all checked and some of it reloaded, rehandled and readjusted at St. Ignace. On south bound business arrangements into car load lots for points in and beyond Detroit are arranged, etc., at St. Ignace. This involves re-
418 handling of most small freight at St. Ignace. The freight coming onto our line across the ferry involves re-handling or the same thing. If there were enough freight in the car it might go through to Detroit without change at St. Ignace.

Freight handled through the Soo over C. P. R. is handled at St. Mary's Transfer station at Soo in charge of the complainant and Soo Line, who bear the expense equally. Business coming on the Soo Line and D. S. S. & A. if going east, is transferred to C. P. R. cars; going west it is transferred to D. S. S. & A. or Soo Line cars, as the case may be, at the expense of those companies without the C. P. R. participating.

The Western Express Co. was organized 1895; to August 28, 1906, D. S. S. & A. received the total net earnings on its line. The August 28, 1906, contract fixed 45% of gross earnings of express company on D. S. S. & A. with minimum of $3500 per month as D. S. S. & A. proportion. June 1909, D. S. S. & A. sold its stock in express company to Soo Line at par, when a new contract was entered into giving D. S. S. & A. 45% of gross earnings on its line with no monthly minimum. To the time of sale the express company had

accumulated a surplus of $192,300 of which D. S. S. & A. received 50% or $96,150. There were no dividends paid previously.

During the time when railroad company received the entire earnings on its line, the D. S. S. & A. had withheld from its payments certain amounts as working fund, and this was distributed to South Shore in 1902, $9,640, and 1905, $5,000.

Up to 1906 the contract of the Western Express Co. with the railroad companies (Soo Line & D. S. S. & A.) was that each should receive the net earnings made by the Express Company on its line. Up to June 30, 1908, D. S. S. & A. had received in earnings from the Western Express Co. $562,986.39. We have no expenses in
419 connection with that. The D. S. S. & A. upon the $25,000 stock received about $41,700 a year. It sold this stock for $25,000.

The express revenue for subsequent years was: 1909, $41,793.38; 1910, $39,531.51; 1911, $38,827.28; 1912, $31,374.04. A part of 1909 was under the old contract.

I don't think that accounts for making it so much higher. I think the rates and the earnings of the express company were higher at that time. The only difference was one contract provided for a minimum and the other did not. I don't think the Western Express Co. operates on any other road than these two, except a small portion of the C. P. R. in Maine.

In apportionment of the advertising expense as between passenger and freight 99¼% was allocated and 1% divided on Michigan train miles; total to Michigan was $3,624.56, with $3,586.94 to passenger. This was divided between inter and intrastate passenger on equated basis of 100 to 115; 59.39% to intrastate and 40.64% to interstate. A considerable proportion could have been assigned to inter or intrastate directly on inspection of the vouchers. We did not do that as where were so little of the expenses where that could be done, and there are other items, other accounts, where assignments could have been made less satisfactory, but which would have assigned a good deal more to intrastate than we have done. It is impossible to do much in the assignment of the expenses between intra and interstate except in one or two accounts. But upon a number of accounts it would have been possible to have quite readily assigned between inter and intrastate a part of the items at least. So far as my accounting has made any separation between interstate and intrastate expenses, it has not ben based upon any requirement of the Interstate Commerce Commission.

420 The income and expenses of the Mackinac Trans. Co. are as follows:

	Total.	Mail.	Express.	Freight, misc.	Pass.	Expenses, including taxes.
June 1909 to April 1910, 10 months	$43,697	$1,324	$2,053	$2,039	$38,278	$102,443
May 1910 to April 1911, 12 months	49,664	1,443	1,861	2,852	43,506	96,323
May 1911 to May 1912, 13 months	54,126	1,723	1,746	4,942	45,711	102,175

We have no figures indicating the amount or tonnage of freight passing over the ferry. There is a record of the number of cars. I could not approximate without it. In apportionment for 1910 under docks and wharves, the following number of cars transferred, appears:

	Freight cars.	Passenger cars.
1910	50,055	5,347
1911	49,578	5,304
1912	44,894	5,972

The term passenger cars, includes baggage, mail and observation cars.In apportionment of expenses I treated one passenger car as equal to two freight cars.

Maintenance expenses on the trackage used exclusively in freight business is scattered through the accounts, and it would be impossible to pick it out.

It was impossible to ascertain the expenses on those tracks therefore we could not allocate them to freight. We could not do otherwise than to take the arbitrary basis of train miles for that.

I do not know any other basis that would divide the expense as well as the revenue train mileage. There is no way to pick out the maintenance of way and structures expenditures, incurred on account of the freight business. It cannot be done. In my opinion the cost of maintenance of such tracks is not over one-third of the cost
421 per mile of the cost of maintenance of main line tracks. There is about 62 miles of it.

If I were making an estimate I would say one-third is a fair figure. That is my idea of the average; some are maintained better than others. On some the maintenance is very slight, and on others it is considerably higher. The Fiborn branch would be higher. It would be impossible to do much more than estimate; I tried to do that.

On Complainant's line, both freight and passenger traffic are more dense Marquette to Houghton than on other parts of the line.

I should say traffic was heavier from Marquette to Soo than from Nestoria west to State line. On both those divisions the traffic is considerably lighter than from Marquette to Ishpeming and there to Houghton, both in the freight and passenger departments. My judgment is it would be slightly heavier Soo Junction to St. Ignace than Marquette to Soo Junction.

I cannot tell you on what part of the line the operating expenses are heaviest; we do not endeavor to separate them by divisions. I think we might give you some maintenance costs as to divisions, but we don't separate operating expenses. We make figures on separate sheets as monthly exhibits for our officials for their information, so they can compare what is being done in certain items on one division with another division.

On the South Shore there are four trains that run in two states—two each way a day on main line. There may be other trains that come up over the state line from the south, considered as interstate,

where we attach a locomotive to the interstate train and take it on.

422 No records of the train or car movements or switching operations in the yards is kept.

The apportionment of 90% and 10% as between passengers and freight as percentages of expense of switching and kindred items is purely arbitrary and not based on any record of train or car movement, or any statistics. It was a matter of judgment and estimate as to the relative proportions of the switching in the two classes of service.

Considering switching expenses, arbitrarily assigned on the basis of 10% and 90% as allocated, in our computation, 66.94% of the total operation expenses were allocated in 1910.

There were a number of other items where an arbitrary basis of assignment was used to reach what we call direct allocations, e. g.: steam locomotive repairs, yard expenses, supplies for locomotives, including lubricants and fuel; fuel for road locomotives, so far as the locomotives were used in both passenger and freight service, fuel was apportioned to each service on miles run in each; we estimate same cost per mile for fuel for freight locomotives as for passenger locomotives, where locomotives are of the same size and type. The figures heretofore produced indicate the cost of fuel per freight locomotive mile (19¢) to be considerably higher than per passenger locomotive mile (11¢). That is acounted for by the fact that heavier locomotives were used in freight service, where they are used almost exclusively or entirely in that service. We were working on the totals and not on individual locomotives when we got the figures of 10¢ and 11¢ for passenger mile for coal, and 19¢ for freight.

I think on the average, larger locomotives are used in freight than in passenger, service.

I am not prepared to say that the cost per mile for coal is the same in passenger and freight service. The passenger train loco-

423 motives are lighter and the mileage in the freight is made more slowly than in passenger service.

Other items given as being directly allocated which were allocated on arbitrary bases, are the following: part of train supplies and expenses (under transportation); Industrial and *E*mmigration Bureau; station employees; station*a*ry and printing, traffic;

The C. M. & St. P., C. & N.W. and Soo Line are operating for 2¢ passenger fares in Michigan, as are also some of the roads in Wisconsin including complainant, since 1907; most of the roads in lower Michigan operate under 2¢ fares, there may be some small roads that don't.

The items included by me as being directly allocated in the use of Complt.'s Ex. 41, Delf, on which some arbitrary basis was used, are same for years 1910, 1911 and 1912, except the Industrial and *E*mmigration Bureau. The percentages which I treated as allocated directly, which include those heretofore described as being allocated on arbitrary bases, are: 1910, 66.94%; 1911, 68.1%; 1912, 67.4%.

On Feb. 24, 1913.

DELF, recalled.

Further cross-examination.

By Mr. Wykes:

There is a separate dock charge, becoming effective Feb. 24, 1913, of 5¢ per ton, on ore, shipped within 10 days after arrival, and ¼¢ per day additional for storage, if it is not shipped within 10 days. That has been added to the previous rates of 25¢ or 30¢.

More than 90% of our ore shipments pass over the Marquette docks and is given separately as interstate iron ore. Not more than 10 or 15% of the rail shipments are interstate.

The greater part of ore passing over the Marquette docks bears 25¢ rate, say 75% or 80%, the remainder bears a higher rate.

421 The rates including dockage, have now gone to 30¢ and 35¢.

The rates at 25¢ and 30¢ have been in effect 7 or 8 years. Previous to 1895 or 1896, they were 30¢ and 32¢ or 35¢. There was material reduction when the L. S. & I. commenced operation about 1896.

(Agreement that all tariffs produced may be used without being introduced in evidence.)

Sheets showing maintenance expenses by divisions for 1912, for April 1911 and May 1911, produced, marked Defts.' Ex. 10, Delf. These apportionments were from reports rendered by road-masters on the various divisions and the expenses are all in the general block "maintenance of way and structures."

I made a tabulation showing the average running time for passenger trains on Dec. 15, 1910 and June 30, 1911. On Dec. 15, 1910, the average running time for passenger trains between terminals was 22.4 miles per hour, which includes time occupied in making stops. On June 30, 1911, the average speed was 24.2 miles. The table showing speeds of various trains was marked Defts.' Ex. 11, Delf, and introduced in evidence.

This exhibit comprehends the movement between selected stations to show the higher speeds. The average speed of freight trains between terminals including stops was: Dec. 15, 1910, 10 miles per hour; June 30, 1911, 10.7 miles per hour.

There is passenger service on the south line between Eagle Mills and Negaunee, but none Negaunee to Winthrop Junction. On the south track, Eagle Mills to Negaunee, there is a break or cave-in at Queen Mine—there is no passenger service on that track. This is the old Marquette and Western line running through Queen Mine property to Negaunee. The trains which take the south line out of Marquette run over that track to Eagle Mills. They then take one of the new tracks of the north line into Negaunee.

425 (Witness states branches used exclusively in ore business, as follows:)

"The Negaunee mine branch, .21 of a mile; Negaunee and Palmer branch, 4.19 miles; Milwaukee branch, 1.74; Mary Charlotte branch, 1.39; Teal Lake branch, 1.39; Lake Superior mine pit .34; Lake shaft, .32; Winthrop mine branch, 1.94; American mine branch two miles; Champion mine branch, .98; Imperial mine branch, 1.03; Webster mine branch, .89; Beaufort mine branch, .72."

Side tracks of these branches would come under the same use as the branch. Wherever the word "mine" is used in connection with the siding, on Complt.'s Ex. 1, Riggs, they are mine sidings. There are quite a number of tracks at Marquette that mostly ore business is done on.

The figures in our income due to mileage books are for the mileage as used. On June 30, 1912, we had out $19,365.66 of mileage not used; I think the amount outstanding is increasing;

Operating ratios of the company from the reports to the State Railroad Commission, follow:

	Michigan.	Entire line.
1910	64.88%	68.72%
1911	69.59%	72.07%
1912	72.00%	75.98%
1913	75.55%	79.83%

Our passenger train mileage includes mileage made on the Mineral Range by South Shore trains as follows:

1910	19,544 miles
1911	39,424 miles
1912	9,912 miles

In each of the three years there was about 30,000 miles of passenger train mileage made on South Shore in Michigan, not included in our mileage figures, this being made by C. & N. W. and C. M. & St. P. trains. Those trains were drawn by locomotives of, and had train crews paid by, those companies and the equipment belonged to them. The revenue came to South Shore. There were other trains on the C. & N. W. and C. M. & St. P. which were operated by D. S. S. & A. locomotives, and train mileage of those trains is included in our mileage.

426

DELF.

Redirect examination:

The property of M. H. & O. except 80,000 odd acres of land was deeded to D. S. S. & A. in 1900; the land grant lands owned by the D. S. S. & A. Ry. were deeded to trustees who, in turn, deeded them to South Shore Land Co., by whom they are now held. The stock of South Shore Land Co. is entirely owned by D. S. S. & A. In 1887 these lands were conveyed to D. S. S. & A. but in 1900 were deeded back to M. H. & O. and then deeded to trustees and by them to South Shore Land Co.

The time cards, chart, and train sheet referred to in McPherson's

testimony (Complt.'s Exhibits 61, 62 and 63) are the originals of what they purport to be. I assisted in making the chart.

I prepared statements showing for 1911 and 1912 the percentages of card and coupon tickets which were interstate and intrastate. The percentages of all tickets sold which were intrastate were: 1911 and 1912, card or local tickets 98%, coupon tickets, 75%; and of the total of all tickets intrastate tickets was 94%.

In operating expenses are considerable sums which would be allocatable or approximately to intrastate, or which plainly appear chargeable to intrastate in greater proportion than the percentages suggested in the testimony for the division of Michigan passenger
expenses between the intra and interstate passenger busi-
427 ness. Wages of station employees, passenger trainmen, conductors, baggage-men and station employees in Michigan; passenger proportion 1910, $37,119.96; 1911, $41,033.33; 1912, $40,840.53. As 94% of the ticket sales by the employees were intrastate tickets it seems proper if we are endeavoring to allocate between inter and intrastate, to apportion 94% of their expenses to intrastate. It was divided on the revenue basis equated, 1910, 56% intrastate. As 85% to 88% of the total ticket or passenger fare collections made by conductors, were intrastate, and 84% to 88% of the passengers traveling on trains are intrastate passengers 84% or 88% of the wages of those trainmen should be assigned to the intrastate business. These items were: 1910, $45,189.58; 1911, $49,969.53; 1912, $52,275.23.

The fare reduction in Michigan of passenger fares from 4¢ to 3¢ was in Sept. 1907; since that time we have never made as many passenger miles as in 1907. That appears on Complt.'s Ex. 43, Delf, the passenger miles were: 1907, 33; 1908, 32; 1909, 32; 1910, 32; 1911, 32; 1912, 31; millions in each case. 1907 was the biggest year in the history of the company. Three months of the year ending 1908, were on the basis of 4¢ fare.

DELF.

Recross:

In 1907, the number of passengers traveling one mile was much more than in previous years. No subsequent year fell as low in passenger miles as any of the years previouss to 1907. In 1907 the freight tone one mile increased 7 million tons over 1906, and the next two years, 1908 and 1909, the freight earnings fell off considerably and recovered again in 1910. In 1907 the passenger miles increased approximately 4½ million miles over 1906. In 1910 the
passenger train miles almost recovered to the point of 1907.
428 The average received per mile per passenger has been the following: 1906, 2.825¢; 1907, 2.785¢; 1908, 2.59¢; 1909, 2.541¢ 1910, 2.543¢; 1911, 1.519¢; 1912, 2.551¢.

It is the general impression that 1907 was a good railroad year all over the country, and better than the next two years.

Ticket agents do other things besides sell tickets; some are telegraph operators, they carry mail to post offices, bill freight, make all

necessary repairs, sell accident insurance; sell pullman tickets, act as agents for telegraph and the express companies, build fires, check, load and unload baggage.

I applied the percentages derived from the sale of tickets only to passenger proportion of compensation. In the sale of tickets for our line we have card and book tickets; the running and terminal times of the trains and prices for the tickets, are all known to the ticket seller and it is simply a matter of reaching around and getting the ticket and passing it out, and the inquiry with regard to the time of the trains is very briefly answered. Where the agents sell tickets off the line to foreign lines, it in instances consumes a good deal of time to look up the time and the connections and incident things.

I treated the salaries of station employees as common and divided between inter and intrastate on equated basis, that was on the theory that there was such a small part of the operating expenses that can be separated between inter and intra business that it was a fair proposition to divide the total passenger expenses between the inter and intrastate as we have done it, without trying to allocate any; where error occurred in one instance it was offset on the other side. It is not possible to reach a mathematical or a close determination of the amount of time of the ticket agent used in the interstate or in intrastate service.

429 The average number of cars per train mile on the South Shore were as follows:

	Passenger train cars.	Freight train cars.
1908	3.98	17.19
1909	4.27	16.55
1910	4.33	17.36
1911	4.42	18.41
1912	4.52	18.69

On April 22, 1913.

DELF, recalled.

Further direct examination.

By Mr. Butler:

(The witness produced a statement containing separation of certain operating expenses by divisions, for the years 1910 and 1911.) The Western Division as shown on these sheets, comprices the division Nestoria to Superior. The statements are as follows:

Division of Certain Roadway and Track Expenses, Year Ending June 30th, 1910.

	Mackinaw Division.	Houghton Division.	Western Division.	Total.
Superintendence	$5,857.22	$5,320.17	$6,151.95	$17,329.34
Ballast	1,134.12	513.50	857.17	2,504.79

432 These were prepared for the same purpose and in the same manner as the previous statements for 1912 (Defts.' Ex. 10, Delf).

(Witness produced, and there was introduced, a compilation (Defts.' Ex. 13, Delf) showing the speed of freight trains for June 30, 1911, and Dec. 15, 1910. These are the same days covered by the statements previously given for passenger trains. This covers freight movement between the same points as listed for the passenger trains, as far as I could make it up. I don't know that it covers all the freight train movements. I found none showing train movements faster than these. I gave instruction to put in the highest movements.

Defts.' Ex. 6, Maney, prepared by me, is a statement of earnings per train. The method of arrival at the mail and express earnings shown on the exhibit was by arbitrary apportionment.

The 90% and 10% for the division of the costs of yard locomotive employees and enginemen was on the basis that we had always used since we have endeavored to make a division of operating expenses between passenger and freight business, back in 1894, and prior to that time, when I. C. C. required us to divide those expenses in our reports. The assumption was that that represented the time of men employed in the two different services.

Q. The expense of the maintenance of the property that is used by the locomotive that is divided on the basis of 10% and 90% should also be divided on the basis of 10% and 90%, should it not, if you could separate that expense from the expense of maintenance of main line, assuming that the 10% and 90% is proper?

A. I don't think so.

Q. Your idea was that the switching movement was 10% for the passenger service and 90% for the freight service, and that switching movement uses the sidetracks; if your percentages are

432a right in the proportion of 10 and 90, that is true, isn't it?

A. Yes.

Q. Why, in addition to dividing the expense of the men who operate these locomotives on the ratio of 10% and 90%, do you not also divide the expense of maintenance of the tracks over which the operation is carried on?

A. Because that maintenance comes under the general maintenance item of accounts, it is not kept separate, and the general maintenance accounts are divided on the revenue train mileage basis.

Q. The revenue train mileage basis for certain years throws 48% of the cost of maintenance into passenger departments?

A. Yes.

Q. When, as a matter of fact, your observation leads you to the conclusion that the switching operations over those sidings is on the basis of 10% and 90%?

A. I don't see that that is a question at all. That last part, there, is a statement.

Q. The purpose of your division, Mr. Delf, in your assignment of expenses, was to get a fair assignment as between passenger and freight?

A. All expenses, yes, and I have endeavored to be both fair to the passenger and freight departments.

Q. If the operation over the tracks over which switching is carried on is on the ratio of 10% to passenger and 90% to freight, why would it not be fair, and why is it not proper, to divide the expense of maintenance of those tracks upon that ratio, rather than upon the ratio of 48% and 52%?

432b A. Rather than upon the revenue train mile basis? In dividing the total expenses, including the maintenance of these yard tracks, on revenue train miles, there are certain portions of these yard expenses that is apportioned to the freight business that should be properly apportioned to passenger business; that is the time occupied by freight trains on sidings waiting for passenger trains to pass by, and it seems to me that, taking the whole question and all other things into consideration, you get a fair and equitable result, rather than trying to divide the maintenance expense of which we have no record on this 10% and 90% basis.

Q. Then it gets back to this, although you are satisfied in your own mind that those sidings are used by the freight and passenger trains on the basis of 10% and 90%, and there you have somewhat of a close method of apportioning that expense of maintenance between the two different departments, you take, rather, the general division on the basis of revenue train; that is true, is it not?

Mr. Butler: The maintenance is not kept separate, and has never been, and cannot be.

The Master: Well, should it be; that is the point?

Mr. Butler: I don't think it can be; I don't see how it can.

The Master: The reason it is on a different basis is because it is impossible to tell what it is or because that is the proper basis?

A. That is what we have done.

Q. And in your mind you justify that with the general claim that the freight train has to wait on the siding for the passenger train?

A. No, not on that alone. For all the reasons brought out in this case as to the items of expense now charged to freight trains, properly chargeable, if we could arrive at them, to passenger trains.

432c Q. All those reasons were referred to for the purpose of justifying the use of the revenue train mile basis for division of common expenses, where the revenue train mile was made by two different kinds of trains, and the reference to those different items, such as waiting for passenger trains, was to offset the greater weight and the greater number of car wheels and the greater length of train and the greater tractive power required in the freight service; that is true, is it not?

A. I don't know that it is in regard to all of those items.

Q. What I want to know is what justification there is for applying that general and somewhat indefinite method of division on the revenue train mile basis, which throws 48% into the passenger service and 52% into the freight service, when you are satisfied that a large part of the expense is incurred on switching tracks, where the operation is on the basis of 10% and 90%?

A. I think I can only repeat my former answer, that the revenue train mile basis seems to be the only basis that can be fairly used in dividing the common expenses.

Q. You wouldn't say that it was proper to use the revenue train mileage for a part of it, where observation and experience of a good many years and the practice of the company has indicated a different ratio of expense in the different services, would you?

A. I think you have to view that situation as a whole, not by piecemeal, and that it does, then, give a fair division, the revenue train mile basis.

Q. In addition, on South Shore, you have a good deal of mileage not used at all in passenger business?

A. Yes. I think it is 62 miles.

432*d* Mr. Butler: Of spurs and sidings.

A. Yes, those industrial branches. The Bessemer Jct. mileage is included in these branches—in that 62 miles.

Q. There is the Humboldt to Republic branch?

A. There is passenger operation on that.

Q. There is one car one way once a day?

A. There is a daily train. The mileage from Eagle Mills to Winthrop Jct. is included in the 62 miles.

Q. Wouldn't it have been fair, Mr. Delf, to have laid aside the expense on that 62 miles for maintenance before you attempted to apply to all of the expenses the revenue train mile basis?

A. It couldn't be done. You don't know what the expenses are, and couldn't have added them.

Q. It couldn't have been done to a penny, but it could be arrived at by the use of some more or less arbitrary method, could it not?

A. You could use an arbitrary method and lay it aside, yes.

The Master: Could you have estimated it substantially?

A. I have testified that the maintenance of those tracks is not over a third of what it is on the main line per mile.

Q. If you could have arrived at the expense of maintenance of that part of the track not used in the passenger business, you would have located it directly to freight, would you not, before applying your revenue train mile basis?

A. No, I don't think I could.

Q. Why not?

A. Because it would bring in so many other items that you might endeavor to allocate in that same way that you would get so many estimates in that your results would be practically of no value.

432*e* Q. Why would they be of no value? Isn't the thing we are after an allocation of expense between passenger and freight? And tell me why, the closer you locate, we are not getting the most accurate results—why, if we get closer to the point in view than you have gotten, your results would be of no value?

A. When you eliminate these items that you would apply an arbitrary or estimated basis to, and then apply another basis, which the revenue train mile would balance, you haven't a proper factor for dividing the balance. I have testified that there is no revenue train

mileage of the road made on this 62 miles; if there is any, it is a very small fraction of one per cent.

Q. Now, then, why is any equation disturbed by first eliminating the expense of maintenance of this property used exclusively in freight business?

A. You would have to then add something to your passenger percentage to take care of those other factors that you have brought in; where the freight expense is charged to a portion of the passenger expense, you would have to bring another arbitrary in there to offset that.

Q. You mean to tell me that this track and the expense on this track not used in the passenger business has been mentioned in this case as one of the elements justifying the use of the revenue train mile basis?

A. No.

Q. Suppose, instead of its being 62 miles used in the freight business exclusively, it had been one-half the road,—one-half the mileage,—would you still say that the revenue train mileage basis should be used?

A. Well, that would change the entire situation.

Q. Then, to what point would you go before you said that the revenue train mileage basis should be abandoned?

A. I am not prepared to say.

432*f* Q. Now, you have examined certain other cases, Mr. Delf, where the revenue train mile basis for the division of common expenses has been used, have you not?

A. Yes.

Q. Do you know whether it appears in the record, or does it, to your knowledge, appear in the record, of any of those cases that there was a mileage used exclusively in one department of the service?

A. I don't recall any of them, whether that was gone into or not.

Q. Will you give us the various reasons upon which you justify the use of the revenue train mile basis for the division of common expenses?

A. Because I believe it most fairly represents the use of property in the two classes of operation, in every way that it is used.

Q. Does it represent the use in point of time.

A. Time is an element that enters into it.

Q. Then you wouldn't care to say that it represented the use in point of time alone?

A. No.

Q. Because, due to the fact illustrated by the tables this morning, and a similar table the other day, the slower moving train does use the track for a greater length of time and requires exclusive use for a greater length of time than the passenger train; that is true, is it not?

A. I think the passenger trains are on the track just as long as the freight trains; not on any individual piece of track, perhaps; a freight train takes longer time going over the track. Taking the railroad as a whole, the passenger trains are on just as long as the freight; they are on the track all the time, and so are the freight trains.

432*g* Q. Standing in the yards part of the time; that is the reason for the answer that they are on the track all of the time, is it not?

The Master: You mean they are in motion all of the time?

A. No.

Mr. Wykes: I believe I stated that the freight trains occupied the tracks longer than the passenger.

The Master: Do you mean while they are in motion?

Mr. Wykes: If your honor please, this is exactly what I mean: When a freight train is on the track, on the main line, it uses a certain part of the line for a certain length of time in exclusion of all other service. It has the exclusive use of the track during the time that it is on it; that is true, is it not?

A. That is true as to each class of trains.

Q. And the slower moving train, of course, consumes a greater time in getting over the track between terminals; that is true, is it not?

A. Between the same terminals, it would be, yes.

Q. And between the extreme terminals of the road, also; that would be true, would it not?

A. Yes.

Q. And, for that reason, uses the track for a longer period than faster moving passenger trains?

A. It is on the track between terminals—between the points it is running—a longer time than a passenger train would be between the same points.

Q. And that comprehends an exclusive use of the track for a longer time than the passenger train would use it?

A. I don't think it has the exclusive use of all of that track between those terminals.

432*h* Q. I am not talking about all the track between the extreme terminals. Take, for example, Mr. Delf, a freight train leaving Soo Jct., going towards Newberry, would have the exclusive use of the track between those points, would it not?

A. Not necessarily.

Q. It would of the track in front of it?

Mr. Butler: For how long?

Mr. Wykes: Until it reached the other terminal—until it reached Newberry.

A. There might be a passenger train right in front of it, going the same direction; there is no station between Newberry and Soo Jet. about seven or eight miles.

Q. There might be two freight trains in that seven or eight miles?

A. Yes, or one passenger train, and one freight train leave immediately after it.

Q. But the passenger train made that mileage at the rate of something like 35 or 40 miles, according to your tabulation; is that correct? You have it before you, I think.

A. The freight train ran 20 miles an hour in there.

The Master: Supposing a freight train mile consumes twice as

much time as a passenger train mile, what effect would you give that in apportioning operating expenses, if any?

A. I wouldn't give it any.

Q. What other element besides the element of time did you consider in determining the revenue train mile basis to be proper?

A. I think I can only state that generally as the use of the property by the trains.

432 Q. The use of the property?

A. Yes, the general use of the property by the trains.

Q. Isn't it a fact that the freight train is much heavier than the passenger train?

A. As a whole, sometimes it is.

Q. Well, as a rule?

A. I think so.

Q. Isn't it a fact that the number of cars in a freight train is much greater than in a passenger train?

A. Yes.

Q. Three to five times, on the South Shore?

433 A. Somewhere there, from two to four times.

Q. And isn't it in addition a fact that there are many more wheels and wheel impacts in the movement of a freight train than in the movement of a passenger train?

A. Yes.

Q. And isn't it also a fact that greater tractive force is required to move the greater weight?

A. Greater tractive force is required to move the greater weight.

Q. Now as against that, all of which would create a higher expense per train mile in the freight department than in the passenger department, two items have been mentioned in this case, one is the greater speed of the passenger train and the other is the fact that the freight train waits *from* the passenger train,

Q. Now, per train mile, what are the things that make for the higher cost in the passenger service, in your judgment?

A. One is the item of freight trains waiting on sidings for passenger trains, the high speed of the passenger train, the elevation at curves to take care of that, the removal of snow and ice, a great deal of it is done to clear the track for passenger trains, that wouldn't be done if freight trains only were moved.

Q. Is that all?

A. Those are the principal ones that occur to me now.

Q. Now, the element of removal of snow and ice is a small item isn't it?

A. From 28 to 38 thousand dollars a year.

Q. You don't mean to say that none of that would be done if it were not for the passenger service?

434 A. No.

Q. You mean you get to it a little quicker because of the passenger service, you would have to remove it anyhow but wouldn't remove it quite as quickly and wouldn't be attended with quite as much expense?

A. There is a lot of extra expense put into that item to clear the

track for passenger trains, that wouldn't be done if we could let traffic lay until the storm was over, clear the track when that occurred.

Q. Have you ever made any computation to find out how much that was?

A. No, I cannot estimate it.

Q. And when you speak of the elevation of curves do you mean the cost of elevating?

A. No, the wear and tear occasioned by the elevation and the moving of freight trains over them.

Q. Have you ever made any computation to find the cost of that?

A. I have not.

Q. You are not an engineer?

A. No.

Q. And you don't give an opinion on this from an engineering standpoint?

A. No.

Q. Simply from the standpoint of what you have noticed by going over the roads since you have been Auditor there?

A. Simply from general observation in my connection with the railroad work.

Q. But the accounts themselves do not furnish anything to indicate to you that there is a greater expense due to the passen-
435 ger service?

A. No, the accounts don't indicate any of these things.

Q. Nor the extent of it?

A. No.

Q. How do you know, Mr. Delf, that these four items that you have mentioned, the speed of the passenger train, the waiting of freight trains for passenger trains, the removal of snow and ice and the elevation of curves, how do you know that those items of extra expense due to the passenger service balance the extra items due to the freight service that we have enumerated here this morning?

A. I don't know that they balance.

Q. And yet they must approximately balance before you can correctly use the revenue train mile basis, must they not?

A. They should.

Q. Do you know how close they come to balancing?

A. No, I do not."

On Jan. 29, 1914.

DELF recalled.

Further direct examination.

By Mr. Butler:

I have prepared statements showing results of operation of complainant for fiscal year ending June 30, 1913. This statement containing 24 pages, marked Complt.'s Ex. 67, Delf, Jan. 29, 1914. Page 1, Complt.'s Ex. 67, Delf, mileage owned June 30, 1913 (similar to Complt.'s Ex. 31, Delf).

Pages 2-4, Complt.'s Ex. 67, Delf, shows revenue locomotive mileage, divided between states and between passenger and freight. (Similar to Complt.'s Ex. 32, Delf.)

Pages 5-7, Complt.'s Ex. 67, Delf, revenue train mileage divided between states and between freight, passenger, mixed and special service. (Similar to Complt.'s Ex. 33, Delf.)

No mileage made off the South Shore line is included in this statement of train mileage. The mileage of C. & N. W. passenger
436 trains running west of Negaunee to Houghton over D. S. S. & A. and of C. M. & St. P. running west of Champion over D. S. S. & A. are included. The mileage of C. & N. W. trains between Negaunee and Marquette and C. M. & St. P. trains between Republic and Marquette, and Champion and Marquette, is not included.

On C. & N. W. trains running west and east of Negaunee the D. S. S. & A. receives all of the revenue.

On C. & N. W. trains Negaunee to Houghton the train and locomotive crews are employees of, and the locomotive belongs to, the D. S. S. & A.

When the C. & N. W. train comes to our line at Negaunee, its employees and engine leave the train and our employes and engine take it to Houghton. The equipment, except engine, belongs to C. & N. W. or Pullman Co., and I believe consists of mail, baggage, and express car, a second class coach, first class coach, sleeper and diner.

The return of the same train, Houghton to Ishpeming, where it is passed over to C. & N. W. is in the same manner, it being handled both ways by South Shore crew and power. The C. & N. W. pays us 12.5¢ per train mile between Negaunee and Calumet to let that train go over our tracks. The South Shore receives all revenue earned, Negaunee to Houghton, and return, both through and local revenue between those points, getting the local rate on through business either way.

This train does local business between Negaunee and Houghton and South Shore gets and keeps all the revenue; this arrangement permits passengers to go through without change of cars at Negaunee; our company keeps the 12.5¢ per train mile for mileage of this train made on the Mineral Range, Houghton to Calumet.

437 The C. & N. W. also runs a daily train, Negaunee to Marquette and return; the entire equipment including engine belongs to C. & N. W. except Pullman sleeping car, and the crew is C. & N. W. The C. & N. W. pays us 10¢ per train mile for the running of the train, and the entire revenue earned, through or local, goes to the D. S. S. & A. In case of passengers from Chicago on that train, the C. & N. W. allows us revenue from Champion to Marquette, 31 miles, or 19 miles more than from Negaunee to Marquette. We get the local rate, Champion to Marquette, for business carried, Negaunee to Marquette; that rate is about 90¢ or about 3¢ a mile.

That train does a great deal of local business. The through fare is not charged, that is based on Negaunee, plus the local, Negaunee to Marquette, but owing to the chance that the C. M. & St. P. might have carried that passenger through Champion, the C. & N. W. allow us the Champion proportion, giving us the same amount we would

get from the C. M. & St. P., if it had carried it. The same rule would apply to a passenger going from Marquette by the same route to Chicago.

The mileage of the C. & N. W. train Negaunee to Copper Country, and return to Ishpeming, is included in train mileage shown on p. 7, of Complt.'s Ex. 67, Delf, as far as Houghton.

The mileage of C. & N. W. train, Negaunee to Marquette and return, is not included in the passenger train mileage on p. 7, of Complt.'s Ex. 7, nor in any of our statistical figures.

"Mr. Eldredge: The reasons for the payments by the Northwestern, and they are the same for the payments by the St. Paul in a general way, are that the Northwestern desires to compete with the Chicago, Milwaukee & St. Paul railroad for business from Marquette and for business from the Copper country. It can only reach the
438 copper country or Marquette over the line of the Duluth, South Shore & Atlantic Railway Company, but it can reach the copper country and does reach the copper country not only over the South Shore but over the Copper Range.

Mr. Wykes: And the South Shore is in a position to dictate the terms of entrance of the Northwestern to Marquette and to Houghton also?

Mr. Eldredge: Yes."

For C. M. & St. P. passenger trains running over our lines, Champion to Houghton, and Calumet, we receive $15 per day; that train consists of a mail, combined baggage and express cars, second and first class coach, sleeper and diners the distance traveled by this train Champion to Houghton is 63 miles, or 77 miles to Calumet the $15 per day is for the round trip and our company keeps it all.

The D. S. S. & A. power and crew handle the train, Champion to Houghton, the train does local business, the D. S. S. & A. receives the revenue accruing between Champion and Houghton and its employees collect the local fare; on through tickets the C. M. & St. P. pays us the full local out of the through rate. This train mileage is included in the passenger train mileage on page 7 of Complt.'s Ex. 67, Delf.

The St. Paul trains run from Republic (Milwaukee Junction) to Marquette and on return trip Marquette to Champion.

This train is daily, except Sunday, and comes from Milwaukee. The distance, Champion to Marquette, is 31 miles, and Marquette to Republic, 34 miles. The St. Paul power and crew handle the train. We receive all of the fares, both local and the proportion of the through fare accruing between the Junction with the St. Paul and the destination of the ticket; the train does local business between these points.

439 Of the through fares we receive the full local for the distance traveled on our line. The St. Paul pays us nothing additional. The St. Paul, Champion-Copper Country train carries a St. Paul company sleeper, on which our company pays no mileage. The C. & N. W. trains Negaunee to Copper Country and return to

Ishpeming, handles a Pullman car both ways daily, but our company pays nothing for the use of it.

The mileage of the St. Paul train into and out of Marquette is not included in the mileage on p. 7, Complt.'s Ex. 67, Delf.

On the return trip of C. M. & St. P. copper country train we retain the revenue from the origin of the ticket, on through tickets, to Negaunee. That distance is 19 miles more than the local fare to Champion; on a ticket of that kind, Houghton to Chicago, we receive $2.48. The same rule would apply from points between Champion and Houghton. The through rate to the passenger is not increased; it is a mere question of division between carriers.

Pages 8-9, Complt.'s Ex. 67, Delf, car mileage, for year ending June 30, 1913, showing division between states, and between passenger and freight, and other classes. (Similar to Complt.'s Ex. 34, Delf.)

The second item on p. 8, sleeping, parlor and observation car mileage, is the mileage of that class of cars, not owned by D. S. S. & A. The mileage shown at the bottom as sleeping and dining cars, is the mileage of those cars owned by D. S. S. & A.

Page 10, Complt.'s Ex. 67, Delf, operating revenue for entire line and for Michigan. (Same as Complt.'s Ex. 35, Delf.) It is made on same basis as Complt.'s Ex. 35.

Page 11, Complt.'s Ex. 67, Delf, operating revenues in
440 Michigan, divided between passenger and freight. (Similar to Complt.'s Ex. 36, Delf.)

Page 12, Complt.'s Ex. 67, Delf, operating expenses for fiscal year 1913, by general accounts; (similar to Complt.'s Ex. 38, Delf.) This conforms to and is based on I. C. C. classification.

Page 13, Complt.'s Ex. 67, Delf, tonnage statistics for fiscal year 1913. (Similar to Complt.'s Ex. 42, Delf.) The average interstate haul, 66.34 miles, is the average haul in Michigan on D. S. S. & A. of interstate freight; that is also true of the corresponding figure for prior years. I have not in any instance arrived at the average length of haul on our line on the interstate business touching Michigan, including the haul on our line outside Michigan.

Page 14, Complt.'s Ex. 67, Delf; passenger statistics for fiscal year 1913. (Similar to Complt.'s Ex. 43, Delf.) The average haul of interstate passengers in Michigan in this and similar exhibits for 1910, 1911 and 1912, includes no part of the journey of any such interstate passengers, made outside of Michigan.

Page 15, Complt.'s Ex. 67, Delf, freight statistics in Michigan for fiscal year 1913. (Similar to Complt.'s Ex. 44, Delf, and made on same basis.)

Wherever iron ore is referred to on p. 15, Complt.'s Ex. 44, Delf, it refers to iron ore to Marquette dock, and includes none handled otherwise.

The iron ore not going over the Marquette docks appears in freight, other than interstate iron ore. Other ore business is done in Michigan by the South Shore. In fiscal year 1913, 1,031,902 tons of ore was shipped over the docks, and over 100,000 was shipped that did not go over the docks.

441 Neither the tons or ton miles stated against ore on p. 15, Complt.'s Ex. 67, Delf, includes any ore not passing over the docks; that is included in freight other than iron ore.

Page 16, Complt.'s Ex. 67, Delf, showing results of operation. (Similar to Complt.'s Exs. 45, 47 and 48, Delf.)

This statement corresponds with requirements of I. C. C. classification, but does not deduct interest on funded debt; it does allow estimated loss.

Item "separately operated properties" (loss) $69,222.29. This is due to operation of Mackinaw Trans. Co.

Page 17, Complt.'s Ex. 67, Delf, statement of operating results in Michigan. (Similar to Sheet 2, Complt.'s Ex. 45, 47 and 48, Delf.) It is made on the same basis as the previous exhibits.

Page 18, Complt.'s Ex. 67, Delf, statement showing results of passenger business in Michigan, applying estimated loss and divided between intrastate and interstate. (Similar to Complt.'s Exs. 45, 47 and 48, Delf, sheet 3.) It is made on the same plan and basis as previous exhibits; there are slight differences as compared with 1910 and 1911; in those years we were unable to divide excess baggage between intra and interstate business actually; in 1912 and 1913 we divided actually.

Page 19, Complt.'s Ex. 67, Delf, equation for division of passenger operating expenses between intra and interstate business for 1913. (Similar to Complt.'s Ex. 46, Delf.) My testimony regarding Complt.'s Ex. 46, would apply in principle here.

Page 20, Complt.'s Ex. 67, Delf, division of joint facilities revenue, between freight and passenger; it corresponds to Sheets 1, 2 and 3, of Complt.'s Ex. 35*a* and 36*a*, Delf; my testimony in connection with those exhibits, as to method, would apply here.

442 Page 21, Complt.'s Ex. 67, Delf, rents paid joint facilities divided between passenger and freight for 1913; corresponds to form of Sheet 2, Complt.'s Exs. 45*a*, 47*a*, and 48*a*, Delf, and the methods with regard to those exhibits would apply here.

Page 22, Complt.'s Ex. 67, Delf, hire of equipment, division between freight and passenger; this corresponds to sheet 2, Complt.'s Exs. 45*a*, 47*a* and 48*a*, Delf.

Page 23, Complt.'s Ex. 67, Delf, rents received (joint facilities) 1913; corresponds to same Exhibits as page 22.

Page 24, Complt.'s Ex. 67, Delf, miscellaneous rents apportioned. This page also contains statement of outside operations, sleeping and dining cars, for 1913. (This sheet similar to sheet 2, Complt.'s Exs. 45, 47 and 48*a*, Delf.)

Generally speaking Complt.'s Ex. 67, Delf, is made on the same basis as the showing for the years 1912, 1911 and 1910, introduced in various exhibits, and furnishes a good basis for comparisons of results. (The exhibit is offered in evidence.)

Complt.'s Ex. 68, Delf, is an estimate of the effect claimed to be produced by the act complained of in this suit for year ending June 30, 1913.

The net loss shown is: intrastate $127,790.65; interstate $50,745.43, total loss in Michigan $178,556.08; the corresponding ex-

hibit for previous years is Complt.'s Ex. 52; I believe they furnish a good method of comparison of the effect of the act for one year against the others.

"Mr. Butler: Exhibit 68 is offered in evidence.

Mr. Wykes: It is objected to as entirely speculative as not a subject for computation but as a matter which can only be determined by actual practice and actual experience and actually putting the
443 rates into test."

Since being on the stand before I have prepared an exhibit showing the division of operating expenses, between states and between freight and passenger for 1910 by primary accounts, Complt.'s Ex. 45, Delf, simply gave the division by totals. This exhibit, marked Complt.'s Ex. 69, Delf, shows the same results as Complt.'s Ex. 45, Delf, sheets 2 and 3, but shows the details by primary accounts. This was prepared according to the rule indicated by Complt.'s Ex. 41, Delf, heretofore in evidence.

"Mr. Butler: Complt.'s Ex. 69, Delf, is offered in evidence.

Mr. Wykes: It is objected to as being based upon arbitrary assumptions which are not the fact, and on the ground that it does not make actual divisions where possible and that it does not make divisions in accordance with the facts."

Complt.'s Ex. 70, Delf, is similar to Complt.'s Ex. 69, Delf, except that it relates to fiscal year 1911; this divides operating expenses between states and classes of service by primary accounts. It is made on the same basis as Complt.'s Ex. 69, Delf, is the details of the totals shown on sheets 2 and 3, of Complts. Ex. 47, Delf, and is made according to the rule indicated by Complt.'s Ex. 41, Delf, (offered in evidence subject to objections stated for Complt.'s Ex. 69, Delf.)

Complt.'s Ex. 71, Delf, the same as Complt.'s Exs. 69 and 70, Delf, except that it divides the operating expenses by primary accounts for the year 1912. (Offered in evidence subject to same objections as to Complt.'s Exs. 69 and 70, Delf.)

Complt.'s Ex. 72, Delf, similar to Complt.'s Exs. 69, 70 and 71, Delf, except applying to fiscal year 1913.

443*a* Complt.'s Ex. 73 is a statement of the freight traffic movement in Michigan for the fiscal years 1910 to 1913 by commodities, showing the freight which originated on this road, freight received from connecting roads and other carriers, and the total tonnage, and the percentage of each to the total. This classification of commodities is that prescribed by the Railroad Commission of Michigan, except that I have made a further subdivision by dividing the item "ore" so as to show the ore to Marquette docks as a separate item, that being an entirely interstate movement.

There are four different points of origin for freight. Part of it originates on the D. S. S. & A. Railway in Michigan, part on the D. S. S. & A. Railway in Wisconsin, and part is received from other carriers at Michigan junctions, and part is received from other carriers at Wisconsin junctions. Freight originating on our line in

Michigan is either delivered to consignees in Michigan on the D. S. S. & A. Ry. or delivered to other carriers at Michigan junctions, or carried into Wisconsin by the D. S. S. & A. Ry. Freight originating on our line in Wisconsin is either delivered to consignees in Michigan on our line or delivered to other carriers at Michigan junctions.

Freight received from other carriers at Michigan junctions was either delivered to Michigan stations on our line or delivered to other carriers at Michigan junctions, or carried into Wisconsin by our line.

Freight received from other carriers at Wisconsin junctions was either delivered to Michigan stations on our line or delivered to other carriers at Michigan junctions.

I have ascertained from the records of my office the Michigan intrastate tons received from each of the four classes of sources, and also the disposition of the same. I have ascertained like information concerning Michigan interstate tons.

443*b* Complt.'s Ex. 74 is a statement prepared to show the stational service given to freight other than ore to the Marquette docks for the fiscal year 1913 in Michigan.

The freight which originated on our line in Michigan and was delivered to consignees on our line in Michigan is all intrastate and received two stational services, one at the point of origin and one at the point of delivery. The stational service given to the intrastate tons of this class would be represented by the number of such tons multiplied by two.

The unit of service being the local service given in originating or delivering a car load shipment, which we will call a full terminal service, it was calculated that the service given at a junction point, of receiving from or delivering to another carrier a like amount of business, was one-fourth of the service given to the local business. Using that as a factor, shipments which originated on our line in Michigan got one full terminal service at the point of origin and 25% of one full terminal service at the point of delivery to the other carrier. Multiplying the total number of tons so originated and so delivered at a local junction point by 1.25 gives the volume of service given to the business. This does not relate to, and is to be distinguished from, the service of movement along the line, and is not affected in any manner by the distance the shipment moves along the line.

Freight originating on our line in Michigan and carried by us into Wisconsin is all interstate and gets one full stational service at the point of origin.

Freight originated on our line in Wisconsin and delivered to consignees in Michigan on our line is all interstate business and received one full terminal service in Michigan at the point of delivery.

Freight originating on our line in Wisconsin and delivered to other carriers at Michigan junction is all interstate business
443*c* and received 25% terminal service at the junction point in Michigan.

Freight received from other carriers at Wisconsin junctions and delivered to Michigan stations on our line may be either intrastate or interstate, depending upon its place of origin. Such freight re-

ceived a 25% stational service at the junction point where it was received from the other carrier and one full stational service at the point of delivery in Michigan.

Freight received from other carriers at Michigan junctions and delivered to other carriers at Michigan junctions includes both intrastate and interstate freight and received a 25% terminal service at the junction where it came on to our line and the like service at the junction where it left our line, making a total terminal service of 50%.

Freight received from other carriers at Michigan junctions and carried into Wisconsin by our line is all interstate business, and received a terminal service at the junction where it was received only—a 25% service.

Freight received from other carriers at Wisconsin junctions and delivered to Michigan stations on our line received one stational service in Michigan at the point of delivery to the consignee.

Freight received from other carriers at Wisconsin junctions and delivered to other carriers at Michigan junctions is all interstate business and received a 25% stational service at the point of delivery at the Michigan junction.

Exhibit 74 shows that the proportion of the terminal service given to the intrastate freight to the total is 55.3%, and to the interstate 44.7%.

Complt.'s Ex. 75 is a statement of the freight train mileage in Michigan for the fiscal year 1912, mileage of ore trains between Marquette and the mines not included. That mileage is shown by three classes of trains, local freights, time freights, and extras,
443*d* and is divided into two classes of service, called stational service and road service. 50% of the local freight mileage or time of service has been assigned to the stational service, 20% of the time freights, and 25% of the extra freights. Of the total service so divided, the result shows that 32.2% is stational service and 67.8% is road service.

These percentages which I have used as to the proportion of stational work done by the different trains is obtained from the testimony of Mr. Lytle and the conductors and confirmed by my own opinion. I am familiar with the operation of the trains, and it is my opinion that the percentages are conservative and low as to the proportion assigned to stational work. I am sufficiently familiar with the amount of traffic and the work at interchange to compare the amount of service required and the average interchange at junction points with the amount of service required on the average to receive or deliver freight from consignors or to consignees on our line.

Before I became auditor of the road, I was agent at a junction point, and handled the interchange work there, and also the local work, and I am familiar with the physical condition at the various interchange points in Michigan. In my opinion, the average volume of work or service required in receiving or delivering at interchange as compared with receiving or delivering at a station of origin

or destination on our line is less than 25% at the point of interchange compared with that at the point of origin or delivery.

Complt.'s Ex. 76 is a statement of the operating expenses in Michigan by primary accounts for the fiscal year 1912, showing, among other things, the operating expenses on freight other than ore to Marquette docks subdivided into three parts, the first being that part not separated as to road and stational expenses, the next into road expeness, the third part into stational expenses, and a final division on the exhibit of the expenses between the intrastate and interstate freight business.

443*e* We are not required to keep separate account of the expense of movement of ore to the Marquette docks, but we have kept that expense separately for the calendar years 1911, 1912 and 1913. We did that for the purpose of justifying an increase in our ore tariff in a matter before the Interstate Commerce Commission.

In preparing Ex. 76, it is found that certain freight expenses assign themselves between road and stational. For instance, the items in the maintenance of way and structures account are not divided between road and stational, whereas such an account as Station Employees, and the account of Yardmasters and their Clerks, are all stational. Out of the road accounts, including the wages of the freight train employees, fuel, etc., I assigned 32.2% to stational on the percentages arrived at in Ex. 75, which, in my opinion, is a fair and just way to make such division. A similar division was made of certain of the expenses under the head of Maintenance of Equipment.

In dividing the freight expenses between intrastate and interstate, we assigned all expenses under the head of "Not Separated as to Road and Stational" between intrastate and interstate on the relation of the intrastate and interstate ton miles to the total. We assigned the items under the column headed "Road Expenses" on a similar basis, this being the percentage most favorable to the defendants. The remaining column, "Stational Expenses," we divided between intrastate and interstate on the percentages arrived at in Ex. 74, assigning 55.3% to intrastate business and 44.7% to interstate business.

The general expenses were then divided between intrastate and interstate freight on an overhead basis.

I had these figures carefully made up, and gave it a lot of study, and I believe that it arrives at a fair result in the division between intrastate and interstate business.

443*f* Complt.'s Ex. 77 shows the Michigan freight revenue for the fiscal year 1912 divided between intrastate and interstate, the freight operating expenses divided between intrastate and interstate, and the net freight revenue from the intrastate and the interstate business.

Complt.'s Ex. 78 is similar to Ex. 76, except that it is for the fiscal year 1913.

Complt.'s Ex. 79 is similar to Ex. 77, except that it is for the fiscal year 1913.

Complt.'s Ex. 80 is similar to Ex. 75, except that it is for the fiscal year 1913.

(Complt.'s Exhibits 73, 74, 76, 77, 78, 79 and 80 introduced in evidence subject to the objections that they are based on arbitrary assumptions and opinions, which do not represent and which are not the facts.)

The $[illegible]5,000 plus of balance for rental of equipment would be entirely on account of interchange equipment. With a foreign freight car interchanged to and coming on to our road loaded with freight, I would first get a junction report rendered me, which would come each day, showing all of the cars, way bill numbers, and where billed from and to. If the car was going to a destination on our line, some days later I would get the original way bill, which accompanied the car, sent in by the agent at destination point. After the close of the month, I would get an abstract from the agent at destination, showing an abstract of that and all other way bills he had received. It would probably be an interline bill. We would check that rect would apportion the revenue between the lines to whom it belonged. It might be several lines. We would make a report covering all the business received from any one road for the month; they would make a similar report of all freight business received from us during the same month; the difference or balance would be
443*g* paid to the road to whom due. We would have to have an accounting with as many companies as the way bill read over.

In getting the empty cars back, we endeavor to get the cars back as soon as we can with a load; if we have not the business for it, we would have to send it back empty; the rule is to get it back to the same point from which we received it. I don't know the relation of empties to loads at interchange points. The empty movements at the junction point may be on local business. We endeavor to use our own cars and dispense with the use of foreign cars as far as we can. We sometimes have differences with other companies in regard to balances for freight business, which results in correspondence. It is work done and has been got down to a pretty good system, eliminating a great deal of correspondence.

The division sheets, for dividing freight revenue between participating companies, are prepared by the general freight agent, and if a new division goes into effect he sends me a notice, just the same as he would of a new rate. The division sheet is usually made by the line originating the traffic. The arrangement for division is made between the traffic officers of the two roads, which may be the result of a number of conferences and correspondence, and, after it is determined what the division is to be, one road or the other issues the division sheet. Those divisions are not changed much after once established, and our divisions with certain roads have been in effect, with very little change, for 15 years or more.

The proportioning of tariffs covering business on to and off our lines is, I should judge, a somewhat intricate matter. Those are filed with the I. C. C., which sometimes does not agree with the rates and now and then they suspend them. In fixing the local tariff, the complication of taking into consideration the rates of other
443*h* roads is avoided. Sometimes a local tariff is affected by the tariffs of other roads, where there is competition. I think,

though not based on experience, that it is perhaps as difficult to make a local tariff as one in connection with other roads.

I understand they ascertain from the other roads what their rates are, or what they are willing to participate in, and issue a tariff; this is probably done by letter. In making the local tariff, they must ascertain the rates of the other competing carriers, to know how to make a rate to secure the business.

The operation on an interchange shipment delivered to the Canadian Pacific at the Soo would be that we would deliver the car, accompanied by the way bill, on the interchange track, and the switching crew would take it across the bridge and deliver it to the C. P. R. That being treated as our business, we would pay cost of transfer. Business coming from C. P. R. to us is treated as their business. When we get cars from the C. P. R. into the Soo yard, destined to points on South Shore, the switching crew makes them up into trains, ready for the road engine.

The stational expenses, separated before division of freight into interstate and intrastate, comprise all of the expenses incurred at terminal points of the freight, where freight originates or is delivered, such as switching by train crews, dropping and picking up cars, unloading less than car load freight, the expenses of the station force in loading, unloading and checking freight, and in billing, expensing, collection of the charges, receiving orders for empty cars, procuring those cars, and notifying transportation officials when they are ready to be taken out from the point where loaded; and all work by station employees and train crews at stations in connection with the freight traffic.

I got this idea of setting aside the stational cost by a study of the situation. I know of no other case where it has been done.

443*i* The delivery point for our road on cars delivered to C. P. R. is on the Canadian side at the Soo. The distance across the river to be made by the switching locomotive to get the cars to the point of transfer would be a little over a mile. Our trains would stop at St. Mary's transfer, and the switching account locomotives would break up the train. In getting those cars across to the C. P. R., one of the most expensive bridges we have is used.

The cost of transfer would be about $1 a car. Only 29½% of that bridge is in Michigan, and only that part of the expense is charged into the Michigan expenses. It is paid by the company, but it doesn't enter into these exhibits showing the Michigan operating expenses. It is a cost of making the transfer which we have to pay to get the business to the C. P. R. at Soo, Ont.

At St. Ignace, the greater part of our interchange freight goes over the Mackinaw Transp. Co. ferry. We consolidate a good deal of freight into car load lots at St. Ignace. As far as practicable, north-bound freight destined to points on Soo Line would be consolidated by South Shore at St. Ignace and delivered to the Soo Line in the cars without transfer at Trout Lake. It might come to our line over the ferry in different cars, and those cars are unloaded and the freight that is to go to the Soo Line combined in a single

car, or cars, so as to make car load shipments to deliver to Soo Line, to prevent transfer of package freight at Trout Lake.

On Complt.'s Ex. 74, Delf, that business was treated as coming in class 3*b*. The consolidation into car loads would take place at the freight station on the dock at St. Ignace. To make it, the cars must be taken off the boats by a switch engine and taken to the station; another car must be placed beside the freight station, into which that freight is put after it is unloaded; after it is loaded into the other car, that car must be taken and put into the train; the empty car might be taken away empty or might be loaded with other freight depending on circumstances.

443*j* On freight on our line moving through St. Ignace, there is, if necessary, some consolidation of freight before it is delivered to the Mackinaw Transp. Co. to be taken to the Michigan Central or the G. R. & I. If there isn't sufficient in the car that arrives at St. Ignace to make a transfer, and there is freight waiting there to go across, it would be consolidated with that freight; if there is enough in a car to go across, it would not be consolidated.

Freight originating on our line for delivering to G. R. & I. or Michigan Central, including that for which consolidation has taken place, would be included in class 1*b* on Complt.'s Ex. 74.

The operation on a train through St. Ignace containing cars to be interchanged would be: Assuming 25 cars of freight, perhaps five or six of those would be for local delivery at St. Ignace and 15 for transfer across the Straits; the 20 cars would be set into the upper yard at St. Ignace by the train, which would end the connection of the freight train with the cars; the five cars for local delivery would be distributed to the various points; of the 15 cars per transfer, one or more might be less than car load, and, if not full enough to transfer across, would be switched to the freight house for consolidation; the balance of the car load freight, or bulk freight, would be switched directly to the boat. The freight we deliver to Michigan Central or G. R. & I. all uses that ferry, as does that received. I have never made a computation to ascertain whether the cost of transfer runs approximately $1.50 per car. If the less than car load freight was in a Michigan Central car, for delivery to Michigan Central, we would turn it over, regardless of the amount in the car. If part was going to G. R. & I. and part to Michigan Central, we would separate it.

I have no statistics showing the number of empty and loaded cars using the ferry in 1913. As far as the ferry is concerned, a loaded car is treated the same as an empty.

443*k* On a car coming to South Shore over the ferry at St. Ignace, if it were car load or bulk freight, it would be switched to the upper yard and put in a train. if less than car load freight, and to be concentrated, it would be taken from the boat and the movement would be as I have testified.

At Houghton, in delivery of a car to Mineral Range, it is the practice to take that car with a South Shore locomotive across the arm of Portage Lake and deliver it in the Mineral Range yard at Hancock. That is a mile, or a little more. That service is paid for by Mineral Range. It is a cost of the Mineral Range incident to delivery. The

South Shore engine and crew runs through to Hancock, and the South Shore bills on the Mineral Range for the service, and the expenses of the train from Houghton to Hancock.

On a car load shipment, business delivered to us at Sidnaw or Keweenaw Bay by a connecting company for delivery to a connecting carrier at Munising Jct., Sidnaw or Trout Lake would be under class 3*b* on Complt.'s Ex. 74.

Q. Under Mr. Lytle's testimony, a car of freight originating at Sidnaw or Keweenaw Bay would be picked up by a local and taken to Nestoria, and at Nestoria dropped by the local and picked up by the time freight. Assuming that I have stated correctly the operation at Nestoria, what train movement would there be for dropping it and for picking it up?

A. For dropping and picking it up where, at Sidnaw?

Q. At Nestoria. that is, the local would have to switch it out, break the train in two and switch it out into the sidetrack, would it not?

A. If your statement is correct as to that being the train, that would be the movement.

Q. And then when the time freight came along, the time freight would have to stop and break up this train and pick it up, would it not?

443*l* A. Under the same conditions, yes.

Q. Now, the time freight would bring it through to Marquette, and, assuming it to be destined for one of these places that we have previously mentioned, these points of interchange in Marquette, it would be again dropped by the time freight, which would involve the same operation in taking it out of the train, the same operation in putting it into the local, from which it proceeds from Marquette to Munising Jct., Trout Creek (Lake), or any of those places?

A. Regardless of what train brought it into Marquette, they would have to drop it at Marquette, as none of the freights run through Marquette, whether it is local, time or extra, and a new train would be made up at Marquette to take it through.

Q. What would be the stational operation in Marquette on that car of freight, then?

A. The yard engine would have to switch it, put it into a train, provided the train that it came in didn't have all through cars; if it had all through cars, the train wouldn't have to be broken up.

Q. Assume that the freight was a time freight, coming into Marquette, and that this shipment was to be dropped at Shingleton. That would be taken by the local from Marquette, would it not?

A. I couldn't say what train it necessarily would be taken by.

Q. If it were taken by the local, and the train that brought it into Marquette were a time freight, it would have to be broken up, even if it were a full train?

A. No, I don't think it would. If it were a full through train, it would be only a matter of putting another engine on to it and continuing the journey east, instead of letting the one that brought it into Marquette go along with it.

443*m* Q. But that assumes there would be no stop of that train at Shingleton, which was not in the question.

For illustration, the movement involved in our taking a car of freight from the C. M. & St. P. at Sidnaw: Our train would have to take it off the transfer track, where it had been left by the St. Paul, and put it into. If there was no other reason to stop at Sidnaw, but for this car, it would involve stopping the train; it would involve taking the locomotive, or the locomotive and some cars, from the train, backing into the siding or transfer track, hooking on to the car, and taking it out on to the track and uniting it with the train.

At Bergland, a car load of freight would stand on some siding or mill track; to pick it up, they would have to detach the locomotive, or the locomotive and some cars, from the train, back up to that car, connect with it, come out on to the main line and connect with the train. That is typical of all picking up of car load freight at stations where it is not interchange freight. The operation described for Sidnaw is typical of taking it from a connecting line, except at St. Ignace and the Soo.

On shipments of telegraph or telephone poles to Oconto, Wis., over the St. Paul, through Sidnaw, if we haven't the empties, where there is a considerable volume of freight moving between certain points, it is often the practice to request the other company to furnish the empties. Those cars would come to us empty at Sidnaw. From Sidnaw, we would take them to the point where the freight originated; they would then be switched to the originating tracks. The shipper who wanted them would have to give us notice that he wanted a certain number of cars.

The operation with regard to ordering the empty cars would be the same as that where a shipper required an empty car for a single shipment which was not to be delivered to a connecting

443*n* carrier.

In Complt.'s Ex. 76, Delf, we have used 32.2% as representing the time of certain freight trains used in stational service. In applying that percentage to the item, Fuel for Road Locomotives, no distinction is made between the amount of fuel burned by a locomotive in stational service and in road service, making train miles. A part of the time spent by a train in stational service, the locomotive may be standing still. If they are switching cars, they have to keep their steam up to full efficiency, ready to hitch on to the train and start it, which takes more steam and energy, at that point, to start the train, than when running on the road. When a car is switching, it is not under the same load as when in motion on the track, but the locomotive is stopping and starting more frequently in making switching movements.

In getting stational part of repairs to equipment, we have assumed no difference in the movement of the cars in the train, and the movement in stational operation. It assumes an equality there, though, I think the greater repairs are necessitated by the switching and knocking around of the cars than the equipment gets on the road. However, in switching, they handle a single car or set of cars, and the rest stands on the track. It is the practice to make the train

up in station order, so that it is not necessary to handle the whole train when they are making switching movements. The cars being switched receive considerable wear and tear, while those waiting on the track receive no wear at all. The locomotive doing switching would undergo more strain than the normal road movement. You must start and stop it, and the change from inertia to motion creates the damage. I think there is no doubt that the switching movement would be a considerable item of expense in the wear and tear of cars, locomotive and track. I don't know whether it would approximate the road use. I do not believe any of the road locomotive switching was assigned to passenger service.

444 Complt.'s Ex. 81, Delf, statement of locomotive mileage in the several services for year ended June 30, 1913, and apportionment of value of locomotives. This separates Mr. Riggs' value for each locomotive in Michigan into each class of service on the mileage pro rata, in each service.

Locomotives 552, 553, 554 and 700 to 711 inclusive have been put into use since June 30, 1913. I do not know whether 43 was in use before that. Locomotives 552 to 711 have been put into use since June 30, 1913.

Locomotives 37, 38, 39 and 13 recently sold for, respectively, $1,700, $1,650, $1,700 and $1,200; 45 sold recently for $2 000. We credited additions and betterments with the total cost, of $13,-000, for 37 and 39. For 37, 38 and 39, Riggs shows a present value of $3,366 each. Locomotive 51 was put out of service and scrapped July 1, 1913.

The non-revenue mileage would include work trains, but no switching. In designation of classes, I. C. C. classification was followed. (Complt.'s Ex. 81, Delf, offered in evidence.)

Complt.'s Ex. 82, Delf, statement of treasurer's monthly cash and bank balances, July 31, 1901, to June 30, 1913. The average yearly balance for 12 years was $188,088.11; the average of the monthly balances by years was:

1902.....	$52,990.72	1908.....	$134,911.05
1903.....	77,812.41	1909.....	144,516.33
1904.....	147,868.05	1910.....	251,747.50
1905.....	302,580.37	1911.....	245,744.87
1906.....	249,286.11	1912.....	267,162.72
1907.....	176,900.95	1913.....	205,536.21

Those figures were kept in the regular course of business. We pay our regular pay roll men twice a month, since Sept., 1913; formerly, they were paid once a month, about the 24th, for the preceding month. I believe these balances were fairly typical of the average balances during the month. There is no record of time in a given month for the payment for supplies and material; it has always been difficult to meet the payments as they become due. We are hard up for money; some payments are deferred after vouchers are passed and in treasurer's hands, as he hasn't the money. All company receipts are put into the bank as they come in, and

445 out of that bank account is paid interest on funded and unfunded debts, advances to other companies, and investments. The monthly pay roll is from $120,000 to $150,000, varying with the season.

DELF.

Cross-examination:

Our trackage changes more or less from year to year, tracks going in and being taken out and moved from one place to another; that is so of the spurs for traffic purposes; they were in miles: 1910, 49.48; 1911, 50.68; 1912, 62.14; 1913, 66.37; increasing a little all the time. Those are net and do not indicate the tracks moved in the period. The cost of moving such track, and the loss due to moving them, is charged to operating expenses under roadway and tracks.

A local freight, Marquette to Soo Junction, would produce in statistics 108 miles of locomotive mileage. This is the actual mileage between terminals.

A time or through freight or passenger train between the same point would show the same locomotive mileage, 108 miles. The train mileage would be the same as the locomotive mileage, assuming no double headers or pushers. Both the train mileage figures and locomotive mileage figures, are the actual miles run by the trains between terminals, except a small amount of mileage allowed the locomotives at the terminal in going to and from the roundhouse.

The revenue locomotive miles include nothing for road-switching; the time spent switching at a single point over one hour, would appear in switch locomotive miles.

The road or revenue locomotive miles between terminals would cover the switching done at the stations during one hour, e. g.,
446 Marquette to Soo Jct. the 108 miles, actual mileage would cover the switching, no additional mileage put in for the switching.

"Q. Then in the application of your percentage of freight and passenger locomotive miles to steam locomotives repairs and steam locomotives, depreciation to divide between passenger and freight, you have taken no account of that greater use of the freight locomotive in stational work, which is greater than exists in the passenger service?

A. In making that division there has been no distinction between the passenger locomotive mile and the freight locomotive mile. They have been treated on an equality. That is in all instances true of places where I divided expenses between passenger and freight on the basis of locomotive miles."

Fuel for road locomotives under transportation expenses; we term that allocated; the total fuel furnished each locomotive is ascertained and divided according to the service in which the locomotives were engaged during the month, on the basis of locomotive miles. Where the locomotives ran in two services during the month that assumed the same amount and cost of fuel for making a locomotive mile in the freight service, as in the passenger service.

The amount of coal consumed per mile was:

	Cost, tons.	Freight, lbs.	Passenger, lbs.
1913	$2.96	141.30	82.28
1912	3.12	126.46	76.86

Water, lubricants and other supplies for locomotives were divided between passenger and freight on the percentages found for the fuel, on the theory that those things would naturally follow the use of fuel and the amount of heat and power.

In division between passenger and freight, of expenses which I have divided on the basis of revenue train miles, I have taken the actual revenue train miles, and have not loaded the freight train miles in any way for stational cost.

447 The switching locomotive miles (p. 4, Complt.'s Ex. 67, Delf) 357,998 for Michigan 1913, comprises the switching in the yards, and the road switching, where the time spent in road switching exceeded one hour.

Of the mixed train miles, of which on p. 6, of Complt.'s Ex. 67, Delf, 75% have gone to freight; that train does the same work as local freight, 50% of the amount of its time assigned to freight would be engaged in stational work.

In assignments of expenses I have not, at any place, assigned any part of the expenses of the Marquette shops or incident to the maintenance of the tracks into, or grounds around, them to Wisconsin.

The maintenance of way, and structures items of expenses, Michigan proportion, have gone up materially in 1913 over 1912. The amount of M. of W. & S. expenditures in Michigan, were: 1913, $581,520.42; 1912, $454,032.33; 1911, $418,276.45; 1910, $423,-863.39. The increase of 1913 over 1912 was principally occasioned by ballasting and repairs of bridges, trestles and culverts, and roadway and track items. The new stringers put on bridges throughout system in Michigan were treated as repairs.

The ballasting in every year is charged to operating expenses, except where it is done on new construction. This is regardless of whether there is an improvement in grade of ballast or an increase of quantities; no portion of it is charged to additions and betterments, and none ever has been on this line.

The addition of the new stringers in bridges would not produce a charge to additions and betterments unless the result of the addition brought the value of the structure above the original value. The fact of the increase in timber, in amount, unless it increased the

448 value of the bridge, meaning over cost new, would not be charged to additions and betterments; if putting in the timber increased the value of the bridge above the cost new, then the excess would be charged to additions and betterments. The fact that there may have been an increase in the present condition of the bridge, would not necessitate a charge to additions and betterments, but if it were something that increased the cost of reproduction of that bridge, or its value new, then you would make a charge to additions. If you substituted an entire new bridge for an old one, so much of the cost of the new one as equaled the cost of the old one, would be charged to operating expenses, and the excess to additions and betterments.

If in 1913 a wooden bridge which would cost to replace in kind $10,000, were replaced with a plate girder on concrete abutments, at a cost of $9,000, there would be no charge to additions and betterments, but would be a charge to operating expenses of $9,000; there would be no deduction from additions and betterments by reason of the additional $1,000.

Witness gives a statement of amounts expended by the road as operating expenses for bridges, trestles and culverts:

	Michigan.	System.
1913	$61,875.25	$90,162.02
1912	11,380.65	14,815.90
1911	12,481.01	15,913.17
1910	12,869.71	21,153.59

The amount charged to additions and betterments on account of bridges during the same years, was

1913	$71,355.96	$79,571.99
1912	.....	None
1911	.....	"
1910	.....	1,374.85
July 1, 1907 to June 30, 1913	.....	$69,754.53

There may have been some credit which reduced the amount for the period 1907 to 1913, below that for 1913.

449 The rule stated would apply to the replacement of all structures, but not equipment.

The expense of maintaining sidetracks and all items therein that would be charged to operating expenses would appear under general accounts, M. of W. & S. under sub-heads: superintendence, rails, other track materials, roadway and track, removal of snow, sand and ice, and bridges, trestles and culverts, if any. I have not been able to separate the costs or expenditures chargeable to freight on account of switches or sidetracks for any year.

In division of expenses to passenger and freight on revenue train mile basis, each revenue train mile, whether in passenger or freight service, carries with it an equal amount of expenditure on account of sidetracks and switches, except where they have been located to ore. That would be true of such track as spurs given under "branches," e. g. Fiborn Quarry or Danaher spur; the maintenance of all those tracks is included in the general maintenance account, and I have not separated any of that before applying the revenue train mileage basis.

Stationery and printing. Includes stationary supplies, printed books, blank forms, rate sheets, tariff and division sheets and the cost of their printing.

The rate division sheets are used to arrive at the division of rates, passenger and freight, between carriers. There would not be a great deal of work in fixing the proportions and making adjustment between companies after the division was once fixed; in making the divisions on these sheets there is monthly work in the accounting depart-

ment; about 6 clerks, out of about 36 in the accounting department and a part of my time, is on that work. The amounts of the division between carriers go onto our books. This involves a mutual
450 rendering and settlement of accounts and payment of balances; the money we collect for other companies in both the passenger and freight service in connection with what is due us, we distribute, showing the amount due other companies and render them a statement of that amount; they do likewise with us. The division is made in bulk as much as possible. E. g. the business on coupon tickets, Marquette to Detroit, in a single month, would all be divided in one transaction. The tickets are grouped together by months between various points. This is also true of freight way bills. This involves an examination of each way bill and ticket for the purpose of grouping them; this is done by the station agents. They make monthly reports of the passenger business through their stations.

They make monthly freight reports. We get a tissue copy each day of the way bills, issued at our stations; we file them in a book by issuing stations, we revise the charges to see whether they are correct, make the necessary changes to make them conform with the tariff, notify the agents who issue them and the receiving agents of such changes, and file a bill to use at the end of the month in revising the abstract which would be sent at the end of the month.

On passenger business a few stations make daily reports. They make a daily report showing the daily ticket sales and also the total earnings of freight forwarded, for the purpose of enabling us to make an estimate daily of the passenger and freight earnings; that does not contain the details of the ticket sales.

Complt.'s Ex. 67, Delf, p. 12, general expenses; that includes for fiscal year 1913 $23,690, as expenses of this litigation. It does not include anything for my time, that of Mr. Eldredge, or witnesses who are also employees of the company.

That includes $12,000 paid Mr. Fitch, former president
451 of the company, who was not in the active service of the company in this year; he was president many years up to 1911; the amount paid him in 1913, was the same amount as he had previously drawn as salary for a similar perior.

(Witness corrects previous testimony in which he stated the cost of taking out spur tracks was charged to operating expenses; he now says it is charged directly to profit and loss, referring to I. C. C. rule on this subject.)

Complt.'s Ex. 67, Delf, p. 15; iron ore to docks; average distance hauled 17.15 miles. This mileage is from each mine, to the dock at Marquette. The average distances of haul on other classes of freight on sheet 15, Complt.'s Ex. 67, do not take into account the distances travelled on sidetracks or spurs.

Complt.'s Ex. 67, Delf, p. 16; outside operations; the losses on dining car service for 1913, were $11,606.49; the charges against that service are just those required by I. C. C. classification and include nothing for locomotive service or wear and tear of tracks or

M. of W. & S. or anything of that kind, just for the operation of the dining cars exclusively. The sleeper service showed a net revenue of $12,331.81, but includes no track or haulage expense or anything of that character.

Complt.'s Ex. 67, Delf, sheet 16; separately operated property loss, $69,222.29; this is the loss on account of the Mackinaw Trans. Co.

We keep a record treating one passenger car over Mackinaw Trans. Co. ferry as equal to two freight cars, to make a further distribution of expense between ourselves and the Soo Line.

The Mackinaw Trans. Co. gets the revenue from passengers; this was, June 1912 to April 1913, $44,060.50. The number of passengers could be approximated by multiplying this amount
452 by two, as 50¢ is the fare. For the 10 months, June 1912 to April 1913, the gross operating expenses were: $107,920.62. The other earnings of the Mackinaw Trans. Co. were: mail $1,478.55, express $2,231.63; baggage and miscellaneous $785.10; freight $2,386.79. The expenses given include taxes but not the cost of new boat or sinking fund. The income from freight is from freight moving locally between St. Ignace and Mackinaw City, and not passing over the railroads. Freight passing over the railroads bears no additional charge for the use of the ferry in transfer.

Complt.'s Ex. 69, Delf, item superintendence under M. of W. & S. the Michigan proportion divided between passenger and freight on revenue train mile basis. That was done because it was deemed to be fair and equitable method of dividing it—because it was considered that the revenue train miles fairly measured the service given to the passenger and freight departments. A part of that expense was rendered necessary by wear and a part by weather.

Q. Now, what has the revenue train mile to do with the portion of that expense that is caused by weather?

A. The revenue trains use the property that is deteriorated by weather.

Q. But the cars use them likewise?

A. They do.

Q. Why didn't you do it on the car mileage basis?

A. Because the trains are made up of the cars; the trains are a unit.

Q. Not of the same size?

A. No.

Q. Not of the same weight?

A. No.

Q. And not of the same speed?

A. No.

Q. And not of the same wearing effect as to weather conditions, in other words, the movement does not have anything to do with this weather expense?

453 A. The movement of the train does not control the weather.

Q. Nor does it control the expense that is rendered necessary by the weather effect on these tracks?

A. No, the movement of trains does not control that.

Q. A proportion of the cost of these items was due to wear. Why, with respect to the part due to wear, did you divide on the revenue train mileage basis?

A. Because we considered that the train mileage basis fairly measured the portion of the expense assignable to the two classes of business.

Q. But your units of use in the two different classes of service were not on the same number of wheels, were they?

A. No.

Q. Nor of the same weight?

A. No.

Q. Nor of the same speed?

A. No.

Q. What test have you made to determine whether those units, the freight train mile on the one hand and the passenger train end on the other hand, would produce the same wear on track or the same effect in requiring expenses for maintenance of way and structures?

A. It has been impossible to make any such tests.

Q. A part of this superintendence embraced in this item was superintendence of repairs on sidetracks was it not?

A. Yes.

Q. And on branches on which no revenue train mileage is made?

A. Yes.

Q. And on the eight miles main line on which no passenger mileage is made?

A. Yes, about that.

Q. Will you tell me what the revenue passenger train mileage, has to do with the wear or with weather deterioration and
454 the cost of repairs thereby, upon sidetracks, branches or main line not used in the passenger business?

A. It is impossible to ascertain the amount of superintendence applicable to those tracks and it is considered that the revenue train mile fairly measured the maintenance of all the tracks as there are off-setting features, off-setting items and costs to the amount of expense which might be brought into that account or, owing to the cost of superintendence of those non-passenger tracks, brought about by the use of train mile basis. The off-setting features some of them being the greater speed of the passenger train on the main line tracks, the elevation of the tracks at curves the widening of the gauge at curves for the accommodation of the speed of the passenger train, the greater speed, the removal of snow and ice, freight trains waiting for passenger trains, company's freight carried in freight trains part of which is used in the passenger service. It is impossible to ascertain what proportion of these expenses should be charged to the passenger business.

Q. Do you know what weight you would attribute to any one of those elements which you have spoken of, taken separately?

A. I could not express it in figures.

Q. You can only express it in an opinion?

A. In a general way.

Q. You cannot express it in a percentage?

A. No.

Q. Do you know what influence or weight any two of them would have?

A. No.

Q. Or any combination of them?

A. No.

Q. Without taking them all. Will you tell me how, if you cannot by any combination of them without all of them determine the weight or influence, you can tell what weight all of them
455 should have. As a matter of fact you cannot tell it as anything but an approximation can you?

A. No, I cannot.

Q. In the passenger service where do you find any item of any other expense which is comparable with the element of this item of expense in the freight side of your expenses due to maintenance of sidetracks, of branch line and of main line, not used in the passenger business?

A. Comparable in class of service or in amount of cost.

Q. Either; state it to suit yourself?

A. In the amount of cost I should say that the items I have enumerated would approximately compare or balance with the cost of maintenance.

Q. You must have in mind the items you have enumerated which make for greater cost on the freight side and there were other items which you enumerated which make for greater cost on the passenger side. Now, I am saying, take those you have put on the freight side, take from them the cost of maintaining exclusive freight track and you do not think what is left would balance. But you do think that it is necessary to put in the exclusive freight track and its cost of maintenance to make the balance, is that correct?

A. I think by putting them in and making a division on the revenue train mile of all of the maintenance of way and expense that you do get a fair balance between the passenger and freight, including and off-setting those items of freight expense that should be charged to passenger expense.

Q. Then you think it is necessary to put exclusively freight track and sidings in to weight the problems on the other side?

A. I think it does that.

456 Q. You think it is necessary?

A. If the cost of those items on both sides could be ascertained it would not be necessary.

Q. But they cannot be ascertained?

A. They cannot.

Q. But in applying your judgment you think the putting in of the exclusively freight property on the freight side must be put there in order to properly weight the problems to make them equal?

A. In the absence of any means of getting at it.

Q. Then the revenue train mileage basis in that interpretation would not be fair on a road which had no exclusive freight mileage would it?

A. In that case there should be some consideration given to those items of expense in the freight service that were properly chargeable to passenger?

Q. You know, do you not of this revenue train mileage basis being used on roads in keeping accounts where there was no exclusive freight mileage other than a few exclusive said tracks?

A. No, I do not.

Q. You don't know whether there was or not?

A. No.

Q. Do you know whether the situation of the South Shore in the amount and value of the exclusive freight property is exceptional or not?

A. No, I do not.

Q. You don't know anything about that?

A. No.

Q. You don't know and did not investigate that?

A. Why, I do know in a general way that other roads, a great many other roads, have a large amount of exclusive freight property.

Q. But you made no comparison to determine it?

A. No.

457 Q. And you made no comparison to determine if where the revenue train mileage had been used, conditions were comparable upon this particular item of expense?

A. No, I did not.

Q. Now, apply the revenue train mileage basis to practically every item under the maintenance of way and structures account, in your division between passenger and freight?

A. Yes, excepting docks and wharfs.

Q. Can you point out any items under that account which does not exist in side tracks or in the branches used exclusively in freight, on the South Shore?

A. Outside of the docks and wharfs I think they all relate more or less to such tracks.

Q. They would all include some part of the expenses?

A. Some portion of it, yes; a very little as to bridges, trestles and culverts, possibly none.

A. The cost of putting in switches and changing them comes under "Roadway and Track," and the material under "Other Track Material."

Q. In which of the items under the same general account would "Yard and station costs" come?

A. Maintenance of yard and stational costs? What do you refer to by stational costs?

Q. I assume there are some stations where you haven't any yard trackage there. I am not talking about stational costs incidental to the operation and nothing else except those, that would be under maintenance of way and structures.

A. The rails put in a yard track would come under "Rails" the cost of putting them in would come under "Roadway and Track" repairs of station buildings under "buildings, fixtures and grounds."

Q. There would be some of that nature of expense in practically every one of the accounts of this subdivision?

458 A. What nature of expense?

Q. The yard and stational expense?

A. Any of these primary account items, if the work which they describe is done in the yard then there would be some of that expense in the accounts.

Q. And it is customary to do work of the character that would follow under these items in yards is it not?

A. Whatever is necessary.

Q. With the exception of docks and wharfs, I assume?

A. Yes, I think that is probably all. It may be bridges, trestles and culverts; there may be a very little of that if any, there may be under "culverts" perhaps.

Complt.'s Ex. 72, Delf: General account transportation expenses, item station employees; of these we were able to locate to passenger for 1913 $10,746.06. That included compensation of employees selling tickets at stations and dealing with the passenger work at stations exclusively; the agent at Seney for example, would be allocated as common. We were able to allocate the station employees to passenger at St. Ignace, Marquette, Houghton, I believe at Ishpeming, and there might be others. I think we did not allocate to passenger any employees who did anything in the freight service; we endeavored to and I think did, confine it to the men doing exclusive passenger work.

The unallocated amount, under "station employees" was assigned between passenger and freight, on the revenue train mile basis. These men have a great many duties that are not connected with train movements e. g. making up various reports, reports of passenger and freight movements, monthly reports, taking in freight, and issuing way bills, and the general duties of the station. Whether

459 they do anything not connected with the movement of trains, depends upon whether the operation of the road, is considered to be directly in connection with the movement of trains, general operations. It all enters into, or in some measure grows out of train movement as a result of their labor.

Complt.'s Ex. 72, Delf; transportation expenses, items beginning "yardmasters and their clerks"; that and a number of following items are allocated on the basis of 10% passenger and 90% freight.

Q. Did you make any tests since you gave your previous testimony to verify that percentage?

A. I got some figures, but I have not summed them up.

Q. And you have not made any change in those on account of what investigation you have made — them?

A. No.

Q. When you get that summed up we will be pleased to receive it, if you wish to deliver it.

The car accountant keeps a record of cars and their movements. Correcting this morning's testimony, his expenses would be under "transportation expenses, clerks and attendance." This is a considerable item. He gets a report every day from each train conductor,

showing by number all the cars that train has handled, where taken on, and where dropped. He keeps a record of their movement and mileage.

For our cars on other lines he gets a report when a car goes off our line into another line, and a report from that other line if they deliver to still another, and so on, until the car gets home. For
460 foreign cars on our line we report by mail the disposition of their car when we d iver it to some other line. There is a considerable number of our cars that would be off the line and a great many cars of other lines on the South Shore.

This making and receiving of reports involves a considerable amount of work; there is a car accountant and several entry clerks. That expense has been assigned between passenger and freight on the revenue train mileage basis; for the year 1913 with 67 of the cars passenger and 3,303 freight, I would say that the ratio of his attention to these cars would not be 48% and 52% or any percentage near that, but the ratio of allocation would be to cars, and it would be very much greater for freight cars.

Complt.'s Ex. 72, Delf; Shop expenses are spread over the items of expense under maintenance of equipment; the superintendence has been assigned between passenger and freight on the Michigan revenue locomotive miles; the number of locomotives on June 30, 1913, was 97, distributed: to passenger 32, Freight 52, and switch 13. The rail use of locomotives would be shown by Complt.'s Ex. 81, Delf.

The freight cars are repaired in the use of this superintendence all over the line; probably over one-half of it is done in Marquette; correcting previous statement, the superintendence applies only in Marquette shop.

Q. With Marquette shop used in repair and renewal of about 87 passenger cars and one-half of upwards of 3,000 cars, do you think locomotive mile basis fair for that division of superintendence?

A. The principal cost of that superintendence is in connection with the locomotives; a large amount of the freight car repairs—one half—is done out of the shops, and a large amount of that done in the shops being rough work, requires no superintendence; the superintendence is concentrated on the repairs of the locomotives or the higher class passenger cars. I did not take into account the
461 fact that there were 30 times as many freight cars receiving repairs as passenger cars; they could repair 30 ore cars without a particle of superintendence, as against one locomotive, passenger car or sleeper, requiring close supervision, with a lot of superintendence.

(Stipulation: Objection to competency of Riggs to testify as to value of locomotives and rolling stock appraised in Complt.'s Ex. 1*a*, pp. 123 to 129, withdrawn. It is admitted that Mr. Anderson is qualified to and would, testify to the values there stated, and that said exhibit shall be treated in evidence with the same force and effect as though Anderson had appeared and testified to the correctness of the values for rolling stock and locomotives therein stated.)

We have no passenger trains running east of the Soo, Michigan;

all the passenger trains that terminate there are unloaded at the Soo; the joint Soo line and C. P. R. train, stands at our station and takes the passenger going further east. Our train arrives a little before the Soo line train, so the passengers use the station. I believe the C. P. R. has 4 trains per day into our station at Soo—2 each way. All of the passengers, except immigrants in through cars or colonists sleepers from the east over C. P. R., who go west on our line must unload and reload into our cars at Soo, and use our station for that purpose. We pay mileage on the colonists sleepers while they are on our line; we have an immigration station used by immigrants where they don't come in through cars, and have to make the transfer.

Complt.'s Ex. 81, Delf; does not show the switching of the road locomotives separate from the yard switching. It shows all switching mileage of each locomotive, regardless of the service it is
462 in, and includes the switching made by the road locomotives at stations in excess of 1 hour, but not as a separate item. I cannot tell what the road switching for road locomotives would be.

The increase in M. of W. & S. expenses in 1913 over 1912 was in considerable part in roadway and track and bridges and trestles. The increases in roadway and track expenses was: entire line $19,046.19; Michigan, $22,631.55. If a switch were taken out and a different type put in in 1913 the expense, to the extent that the new replaced the old, up to the original cost of the old, or cost of replacing in kind, would appear in item roadway and track, unless the cost was more than $200.

On additions and betterments unless the charge is $200 or more, you make no charge to additions or betterments, e. g., assume it would cost $300 to replace an old switch, and you put in a new one at a cost of $400, the entire charge would be to operating expenses as the excess cost was only $100; if the cost of the new switch was $500, then $200 would go to additions and betterments.

Assume a wooden pit cattle guard taken out and replaced by a new type and that the cost of the new type was $50, the charge would be to operating expenses.

A part of the ballasting expense, including cost of application, putting in new ties and such costs as are incident to getting the ballast under the ties would be charged to roadway and track. The item ballast, includes all expenses incident to the purchase and production of ballast and delivering it to the point of use, and the labor of putting it in is under roadway and track.

The expenditures for grade crossings, fences, cattle guards and signs, increased in 1913 over 1912 because there were more replaced; more maintenance in 1913 than 1912.

463 The item roadway, tools and supplies increased in 1913 over 1912 because more maintenance and more tools — used in performing the work. The item superintendence, increased materially in 1913 over 1912, due to the fact that more work was done in 1913 than 1912. The increases, under maintenance of equipment, steam locomotive repairs, passenger train car repairs and freight train car repairs, in 1913 over 1912, was due to the fact that there were more repairs.

No part of the cost of labor of putting in the increased weight of rail $18,601, in 1913, was charged to additions and betterments and no increased cost of handling and transportation on rail of this character over the lighter rail was included in additions and betterments.

The figures on page 14, of printed report for June 30, 1913, and similar figures in other reports, for additions and betterments are the actual costs of putting in the new structure; that does not mean the entire cost goes to additions and betterments; that it is the actual cost of the addition or betterment portion; it is not necessarily the actual cost of replacement.

"Q. In expense, Mr. Delf, what expenses occur directly in producing a train mile?

A. The wages of the train crew, fuel, water lubricants and other supplies for locomotives; the wear and tear of your track; all of the expenses under maintenance of way, equipment transportation, contribute to the cost of production of a train mile.

Q. The direct costs of producing the train movement and the train mile, leaving out the trackage cost, are those you first mentioned?

464 A. Well, the items under transportation expenses, dispatching trains, superintendence.

Q. And the fuel?

A. All the road expenses.

Q. Labor, water, lubricants and things of that character?

A. All the items to road enginemen, engine house expenses, road, fuel for road locomotives, water, lubricants, other supplies, road trainmen, train supplies and expenses.

Q. Those you have stated you have been able to directly allocate not the dispatching, but the fuel, the water and things of that character?

A. The road enginemen, fuel, the water and lubricants, being assigned on the fuel basis, on the basis of the fuel.

Q. The percentages that would be found by the amounts directly allocated to those particular expenses, should very closely approximate the percentage of the revenue train mile, should it not, if the revenue train mile is a proper basis for apportionment of other expenses?

A. No, I don't see that that follows. I don't see that they should.

Q. Those are the direct expenses, the most direct expenses of producing the train mile, are they not?

A. Yes.

Q. And if the most direct expenses of producing the revenue train mile, do not approximate the percentage reached on the revenue train mile, it rather indicates that the revenue train mile basis is not as good as some other, does it not?

A. No, I do not think it does. I would not agree to that.

Q. You think the revenue train mile perhaps gives more assurance of being correct than direct allocation?

A. I don't see what relation the expenses of fuel for road locomo-

tives, water for road locomotives, and those things, have to do with the repairing of fences or ditches or station buildings.

465 Q. I think you have stated that the revenue train mile does not produce the deterioration there, it is produced by weather and the basis of the revenue train mile is an arbitrary basis for division. I am trying to get to the question of whether that arbitrary basis is proper, by indicating to you that where you have been able to assign directly the costs most nearly related to the production of that revenue train mile, they do not approximate the revenue train mile basis?

A. On your suggestion if we allocate the road enginemen and the road trainmen and arrive at a proportion of 40 passenger to 60 freight, other expenses that come under there are the yard expenses, and taking it, would divide the same way 40 to passenger and 60 to freight; they come under the same head.

Q. The yard expenses you divide 10 to passenger and 90 to freight?

A. My statement would follow if your suggestion, method of dividing them, was followed, if we took the percentage arrived at from things that we could allocate and applied that percentage to other things.

Q. I am not suggesting that you follow that basis, but I am asking you if it is not a proper criticism of the arbitrary revenue train mileage basis, because those expenses which you can directly allocate and which directly produce the revenue train mileage basis, allocate themselves on a different basis and indicate a different percentage of cost in producing the revenue train mile of the different classes?

Mr. Eldredge: Do you say that, or ask the witness to agree to it?

Mr. Wykes: I am asking him if it was not a proper criti-

466 cism.

A. I don't think it would be proper to apply the ratio of fuel for locomotives, road enginemen, road trainmen to the interlockers, block and other signals, crossings, flagmen and gatemen, telegraph and telephone operations, stationery and printing of dispatching trains or superintendence, which are the only items under transportation expenses which are divided on Michigan revenue train miles.

Q. I haven't suggested that you divide on that basis?

A. You are asking me if it wouldn't be proper to divide these other items on that basis.

Mr. Eldredge: No, he is asking you whether the fact that a different ratio is arrived at by actual allocation, does not indicate that the road mileage basis is wrong for those items of expense which you have divided?

A. The Michigan train mileage basis?

Mr. Eldredge: That you have allocated on a train mileage basis?

A. No, I don't think it indicates that.

Q. Those you were not able to allocate directly?

A. The items I have——

Q. And you necessarily take an arbitrary basis?

A. Yes.

Q. You took an arbitrary basis which is composed of unequal elements which no one has been able to reconcile and which depends upon judgment, to say that they are equal. Now the point I put to you is that: considering the uncertainty of the correctness of that due to the fact that it cannot be determined, what weight should be given to the unequal elements on the one side and the unequal
467 elements on the other side; isn't it a criticism of that thing that rests solely in judgment, that the expense which directly produces the revenue train mile, allocates itself in a different way than that judgment that you have applied to this arbitrary thing, would indicate?

A. I don't think it is any proper criticism.

The Master: Will you explain your reason why you don't think so?

A. Because I do not see that there is any relation between the two.

Mr. Eldredge: Explain in detail what you mean; take up the items that you have divided that way and explain to Mr. Baker what you mean and the reason why you think the train mile does allocate properly?

A. Take the item superintendence.

Mr. Eldredge: Just take under maintenance of way and structures and name the items that are divided on the train mileage basis if you want to understand him, I think if you would follow that thing and see what he has allocated on that——

The Master: He could take a single item and illustrate by that.

A. Take the renewal of rails, renewal of ties, I cannot see that the wages of road enginemen in passenger service, road enginemen in the freight service, would bear any relation to the renewal of rails and ties.

The Master: Take another item?

A. The same of removal of snow, sand ice, that would be done by section men and by work train crews. I don't see that the relation between the passenger road enginemen wages and the freight road enginemen wages would be a proper basis to divide that between passenger and freight; the same way all through.

468 Q. Here you have got your tie in the track and part of this, the cause of its renewal and maintenance is weather, and part is wear, and you have to use some arbitrary basis to find out what goes to one service or to the other, and you say it is the revenue train mile because two different classes of trains pass over it, but those you admit are of unequal weight?

Mr. Eldredge: If you make it clear at all so that any one can follow you, confine it first to your weather.

Mr. Wykes: They both enter into it.

Mr. Eldredge: They both enter into it, but they enter into it in a different way; for instance, it would seem, to me that the revenue train mile basis absolutely allocated, so far as weather stress is concerned, whether the other did or not might depend upon a different state of facts.

Q. Read the question to there please. (Question read.) They are of unequal weight, they are of different number of wheels, they are of different amount of tractive force in the locomotive, they are of different speed, and you say that they are equal; now then, you take on the other hand, a force which produces the wear that is found in the consumption of coal, the force that draws the weight, the force that produces the wheel impacts, and we find that that force in the shape of coal allocates itself upon a different ratio; we find that repairs to the moving thing that produces the wear of track, allocate themselves on a different basis than the revenue train mile basis, isn't that a criticism in your judgment of the revenue train mile basis?

A. No, I don't think it is.

Q. Did you make any study of the number of curves on the South Shore, or the degree of elevation, or anything of that char-
469 acter, before you reached your judgment on this revenue train mileage?

A. No, I didn't go into the number of curves or the degree of elevation.

Q. Did you make any investigation of that in any way, that is to determine what degree of curve would be required by a passenger train moving at a certain speed or by a freight train moving at a certain speed?

A. No, I discussed those matters with our engineers though to ascertain that they were facts.

Q. What facts aside from conclusion of equal wear or of greater wear by one service than another did you find; what facts?

A. As to the facts of the elevation and the facts of the widening of the guage at the curve.

Q. But you did not find anything about the degrees of elevation?

A. No.

Q. Or things of that character?

A. Not the engineering technicalities.

Q. Did you make any study of train weights?

A. No.

Q. Did you make any study of train speeds before you prepared the tables with regard to freight and passenger train speeds that you produced heretofore?

A. Except in a general way, to see what the general relation was between the freight and passenger train, which traveled the faster on the average.

Q. Did you make any investigation of the different types of locomotives used in the different services?

A. Yes. I have tried to keep posted on that somewhat for a good many years.

Q. What are the types of locomotives used in the pas-
470 senger service?

A. You mean by types, any particular name, or do you wish the locomotives?

Q. Well, no, I mean the types of locomotives that prevail in the freight service and in the passenger service. Now, assume that your

passenger service is served by an American type locomotive, assume that is the prevailing type, just describe it?

A. Well, I cannot describe those locomotives by types.

Q. Do you know that the prevailing type of locomotives used in the South Shore passenger service is an eight wheel American type locomotive?

A. I don't know that I can state what it is by name of type.

The Master: Are there recognized types of locomotives?

Mr. Wykes: The different types I think have different number of wheels, different length of wheel base and things of that character.

The Master: Is there a classification according to type?

Mr. Wykes: As to the wheels.

The Master: Classification as to the wheels.

A. I cannot give you those classifications without referring to our records.

Q. What is the prevailing type used in the passenger service?

A. I don't know those locomotives by their types.

Q. What is the prevailing length of wheel base in the passenger service?

A. I cannot really testify in regard to those things, locomotives.

Q. Do you know that ordinarily the passenger locomotives have a rigid wheel base of about 8 feet and 6 inches, and the freight locomotives have a rigid wheel base of something like 15 feet and 6 inches?

471 A. The wheel base being from driver to driver?

Q. Yes. You don't know that?

A. I should judge that was about right from my knowledge of the engines.

Q. Did you make any study of the different degree of wear on track on curves, due to the difference in wheel base?

A. Now, what information I have got I obtained from consultation with our engineers and trackmen.

Q. You didn't go into the detail of that?

A. No.

Q. You don't know what wear one of those locomotives would produce as against another?

A. No.

Q. And you don't know what wear a passenger coach would produce on the track as against a freight car?

A. No."

Official cars are principally hauled in regular passenger trains; both classes of trains carry the employees of the company from one point to another; in the superintendence of maintenance of way they travel a good deal on both classes, though on passenger trains where convenient; in inspecting track if a freight train comes along and they want to go to another place they take it; their movements would often be short, from where one gang of men were working to another.

The auditors and company officers travel usually in passenger trains; the persons carried on exchange passes are carried in passenger trains.

Complt.'s Ex. 67, Delf, p. 14: the average haul of intrastate passengers in Michigan of 32.48 miles is arrived at by dividing the passenger miles by the number of passengers; that took into
472 account the passengers from Marquette to the ball grounds, going out by special train of six or eight cars a couple of miles. On a passenger from Soo Jct. to Marquette, paying his fare on the train, depending on the train he was on, he might pay to Soo Junction and Soo Junction to Marquette, and we would get him as two passengers on this computation. A passenger St. Ignace to Marquette, on certain trains would pay to Soo Jct. and then pay again from Soo Jct., and we would get him in as two passengers. There are other points through Marquette, e. g., where if a man traveled on a local on the line there would be a change, of conductors and two cash fares taken.

The man in each instance, including those Soo to Marquette and St. Ignace to Marquette, takes another train every time. Assuming he came through Marquette on No. 1 or 2, he would come through without changing trains or cars; if he paid a cash fare coming into Marquette that conductor would take him to that point, and you might get the man again for two fares on one trip. *As* Nestoria from the west coming east, the same thing would not occur.

"The Master: Then this haul on this would not be accurate would it?

A. It is in accordance with the way you have to make your statistics and reports.

The Master: Where you change trains you call that another haul, where you change trains?

A. If a man pays his fare you cannot keep track of that man.

The Master: If he did not change trains it would be one haul although you get two fares?

Mr. Eldredge: From our standpoint. How could we know that there was a distinction between them?

The Master: I was looking at it as a question of fact."

473 On an interline ticket, the accounting required would be: the ticket contains a printed form coupon, showing the roads over which issued, and upon which the agent writes the destination, unless it is printed, and the amount for which sold; this coupon he retains; at the end of the month he reports all such tickets, grouping all tickets from his station to the same destinations by the same routes, together, sends that report to my office and reports the total revenue collected on the various tickets, and we check it to see that it is correct, and apportion the revenue among the lines interested in the travel; in an extreme case there might be 8 or 10 coupons; reports are made by each company of the amount coming to it from the others and the balance paid by draft. Each company is settled with separately.

On a card ticket the process is: each night the agent goes through

his card case to see what card tickets are sold, makes a summary and records them in his books. At the end of the month he makes a report to my office of the card tickets to each destination, showing the commencing number to each station at the beginning of the month, and the closing number at the end of the month. The amounts are extended showing the numbers sold and amount collected on tickets sold to each station from his station; in my office, the report is checked with the individual tickets and recorded in the books.

His report of coupons or interline tickets are checked with the stubs, he makes a daily computation of amounts and makes a daily report from which we get our estimate of the daily earnings. On the interline tickets the general passenger agent of our road would attend to the printing, get up the proofs, and pay the cost. To sell one of those long form tickets takes longer than to sell a car ticket;
coupon tickets are often made so that he has to write
474 the name of each station to which sold on each coupon, and
stamp each coupon. He must detach the stub and enter the destination on it. We have a standard form for interline tickets in connection with each road and each company gets up its own form.

There probably would be more inquiry in connection with a long trip ticket than with a local ticket, and I presume more inquiry of the conductor about connections and things of that kind. He would not be informed of connections beyond our line, but if he is asked he can take his book and give them the information. I presume many people going on a journey of that kind ask for time tables.

The cost of printing the interline tickets is considerably greater per ticket than the cost of card ticket.

If you should go to any of our ticket agents and tell him you were going to use our line to New York, he would wire for Pullman reservations at the company expenses. It takes the time of the station man to send the message, and to get and communicate the answer. He would do the same thing on a ticket to Detroit or Bay City. We sell considerable mileage; the mileage pulled generally indicates the distance traveled on the trip.

A passenger to Chicago from Marquette, for example, on No. 11, unless in the sleeper would have to use the station and change cars at Negaunee. Passengers from the western division to Chicago on some trains would be required to use the station facilities at Ishpeming or Negaunee.

If in a certain year the intrastate passenger mileage increased 5%, and if our station forces, conductors and train service were there to force working up to their limit, we would have to increase them. If
they were not working up to the limit the additional cost
475 would be very small. The same would be true of a 10% increase, if the trains were not up to their limit. We could carry more passengers in each class, intra and inter state now, without perceptibly increasing our expenses. Take the line as a whole we could increase. If our passenger business should increase 20%, it would not increase the expenses very much, not nearly 20%. It would require the printing of extra tickets, would perhaps affect

the number of the train crew and we might have to run more trains, and increase station forces, and the auditing department somewhat.

DELF.

Redirect:

At the end of the day's work, the ticket agent must examine not only the compartments from which he has sold card tickets but for the preparation of his report also examine compartments from which he sold no tickets. He has to go through all of them to know whether the closing number is the same as the commencing number in the morning.

A passenger paying his fare to Marquette, and renewing his journey out with a different conductor and again paying his fare, could check no baggage.

All coupon tickets are not interstate; over 75% of them are intrastate. Intrastate coupon tickets result from the fact that we sell tickets on points on other lines in Michigan. The expense of handling those tickets is the same as that of handling an interstate ticket, except as the expense of handling the latter may be increased by the number of coupons. The selling and accounting expense of handling a coupon ticket is in excess of that of handling a card ticket. The difference is not great. The principal feature would be the time of the ticket agent in selling the ticket. And this would be greatly offset on the other hand by the difference of time in get-
476 ting his record on the local ticket as compared with the coupon ticket which is right before him. In places where all the tickets were sold by one agent, this would increase the work without increasing the expense. In the accounting department, in my judgment, the expense is about the same in each class of ticket.

In taking into consideration the volume of the passenger business, this account and stational expense of handling a ticket is not great, that is the expense of selling and accounting per ticket. The greater part of the passenger stational service is occasioned by selling and account- for tickets and checking baggage.

The Master: Can you form any idea of the percentage of additional cost or work that is involved in selling the coupon tickets as against the selling of the card tickets?

A. That is a pretty difficult thing to estimate. I do not know that I could venture a statement on that."

DELF.

Recross:

The ticket agent at a station of importance has the card tickets all in a case behind him where the face of each local ticket is exposed; I stated that this time in checking the sales out of that rack for the day was considerable.

"Q. He does it in ten or fifteen minutes doesn't he, or less?

A. I couldn't state the time."

If he has done a considerable amount of local ticket selling, he could not do it in 10 or 15 minutes, because if his sales had been varied, he must take down the closing numbers of his tickets, subtract them and extend the amounts and get at the total of
477 his sales on card tickets to each destination. With coupon tickets he would have his stubs before him, and would total them up for the day. On the card tickets he must find out what number of ticket he starts in with in the morning, and what number he left off with at night.

"Q. Where he has made no sales he knows from the pencil line previously drawn down across the ticket, does he not?

A. No, he pays no attention to that ticket. He has to look at them to see if the pencil mark is on there."

I have produced printed annual reports to stockholders for the system, without division to Michigan by fiscal years for 1905 to 1913 inclusive. (These marked defendants' Exs. 43*a* to 43*h*, 1911 and 1912 previously marked Complt.'s Ex. 39 and 40, offered in evidence and 1905 to 1909 inclusive objected to as irrelevant and immaterial.) Defts.' Ex. 43*h*, Delf, p. 6; printed annual report for 1913. The item "property investment," road $43,946,516, represents all charges into that account less credits, which have been made to the account since the beginning of the operation of the D. S. S. & A. I am not able to say how much of it represents invested money, as a large portion of it is stock and bonds that were issued in payment of completed road. I do not know on what basis the completed road was taken over for the bonds; I know the bonds and stock that were turned over, but do not know on what basis.

I do not know the relation which the amount allowed for the purchased property, bore to the actual cash cost of building the property that was sold; we have no knowledge of what the property actually cost, that is, that property that was acquired in exchange for the stocks and bonds. That was the consolidated roads in 1887;
$22,000,000 of stock and $4,000,000 of bonds were given
478 for a certain number of miles of completed road. I haven't the number of miles of road, something over 300, about 330 miles I think it was, of completed road. This, I think, include all the present main line, St. Ignace to Marquette; part Soo to Soo Jct.,—none to Marquette to Houghton; all Nestoria to Iron River, Wisconsin. It did not include Marquette and Western which was a part of the M. H. & O.; the total of $43,000,000 does include that; it also includes M. H. & O. lands now owned and those sold by South Shore Land Co.; there have been no credits to the account as lands have been sold. I have been South Shore Auditor since 1894. I do not believe there were credits to that account before 1894 for abandoned property, and things of that character. We make no credit for property, e. g., ore docks, cars or freight cars, worn out. The item, same page of printed report, equipment $4,-214,690, has been accruing since the beginning of the road; I do not know whether it represents actual cash investment, before I came in as Auditor; there were no credits made for equipment worn out or abandoned until 1907.

I do not know how fully the bonds of the previously existing com-

panies were recognized in the consolidation in 1887 and taken care of by the allowance of new stock or bonds; I do not know that for any of the companies entering into that consolidation. I have no knowledge so that I can explain the increase in reported cost of road between 1886 and 1888. The D. M. & M. report to the Railroad Commission for 1886, shows a cost of property of $3,011,205 for 150.8 miles, which would be $20,000 a mile in round numbers; the D. S. S. & A. report for that property for the next year and reported by the Railroad Commissioner in 1888 shows cost of road increased to $26,000,000, the mileage increasing to 197, thus increasing the cost per mile from $20,000 to $134,000.

479 I have no knowledge or information whether, in the consolidation of 1886 or 1887, after the foreclosure of the D. M. & M. mortgage, its common stockholders received 60% of their previous holdings in the stock of the consolidated company.

I do not know whether on this reorganization the land grant bonds retained their security and in addition received 35% of their holdings in stock; nor do I know whether the first mortgage bond holders of the D. M. & M. received new bonds of the consolidated company, and a considerable bonus in preferred stock. Our books give no information in regard to any such transaction.

Where we put in a new structure, the amount charged additions and betterments does not show the expenditure for time of general officers, the engineer, the accountant, the supervision, the cost of transporting material, or things of that character. In case an engineer went and laid out the ground his time actually put on there would be distributed to that cost but general supervision and general officers would not be.

The amount of replacements in 1913 was considerably in excess of other years including 1912; that is one of the reasons that contributes to making the operating expenditures for maintenance of way and structures items, larger in 1913 than in 1912. There were more replacements and more additions and betterments in 1913 than 1912; there is apparently a little increase in 1912 over 1911. The Negaunee depot was built in 1911 and the Marquette car shops in 1912. Both that station and the car shops were exceptional structures.

In compiling information for annual reports we endeavored to state the real facts; it is reasonably accurate, and the variation, if any is simply an error or oversight; there are also some clerical errors which correct themselves from an inspection of the *of the*

480 report. We use and rely upon those reports as accurate for the purpose of our business.

I believe the operating ratio in Wisconsin for 1913 was above 100%;

DELF.

Recross:

(Witness produced statement of expenditures for additions and betterments, 1900 to 1912 marked Defts.' Ex. 46, Delf, and introduced in evidence.)

The expenditures on account of road shown are the net expenditures charged to additions and betterments for road.

The totals in Defts.' Ex. 46, Delf, should check with the totals of the printed annual report to the stockholders.

Duluth, South Shore & Atlantic Railway Co.

Train Mileage on Republic Branch, Fiscal Years Ended June 30th, 1910, 1911, 1912 & 1913.

	1910.	1911.	1912.	1913.	Total.
D. S. S. & A. Pass. trains.....	51	34	68	85	238
C. M. & St. P. " "	2,199	2,191	2,191	2,191	8,772
D. S. S. & A. Freight "	1,220	1,866	1,608	1,916	6,610
" Ore "	7,963	6,047	2,926	4,862	21,798
" (Special, Circus)...	....	....	34	....	34
	11,432	10,138	6,827	9,054	37,452

The C. M. & St. P. mileage stated, is that of the passenger trains Milwaukee Jct. to Marquette. This mileage is not included in the revenue passenger train mileage, shown in my exhibits. The small amount of D. S. S. & A. passenger train mileage, is excursions or similar trains.

Between July 1, 1911 and June 30, 1912, fourteen 80 pound split switches replaced twelve 60 pound split switches, and one 70
481 pound split switch, replaced one 72 pound split switch. Between July 1, 1912, and June 30, 1913, one 80 pound switch replaced one 60 pound split switch.

Between July 1, 1911 and June 30, 1913, 74 old style cattle guards were replaced with new steel cattle guards and 18 new steel cattle guards were put in that were not replacements. The total 92 were all charged to operating expenses.

The entire cost of replacing switches was charged to operating expenses; the 80 pound switches, split, cost $40.80, the 60 pound $32.87; and the 70 pound $34.39. This did not include labor.

The entire cost of the new reenforcing stringers on bridges was charged to operating expenses; that is so in all cases where the stringers were put on the bridges to strengthen; I do not know as that is true where the bridges were rebuilt.

DELF.

Redirect:

(Complt.'s Ex. 84, Delf, shows the mileage of certain locomotives, which ran in both freight and passenger services, by months for the year ended June 30, 1913, together with the percent of each in each service for the year.)

Complt.'s Ex. 83, Delf, shows the mileage of each engine for each of the years 1910 to 1913 inclusive, and the percent it ran in each service.

The term "other" under "kind of service" on Complt.'s Ex. 84, Delf, is yard switching or work service, and does not include road switching.

DELF.

Recross:

The locomotives treated on Complt.'s Ex. 84, Delf, are only those which make less than 95% of their mileage in the service to which principally devoted. In making this table the road switching goes into the freight mileage. It is added as switching mileage.

482 In distributing our coal it is.

The switching mileage other than the yard switching, appears as freight mileage in making the distribution of fuel. (Note: Nothing appears in switching mileage for the first hour's work at any station, and nothing appears if the locomotive worked less than an hour at any station.) On Complt.'s Ex. 67, Delf, the freight locomotive mileage does not include road switching mileage; in distributing coal the road switching mileage on p. 4, Complt.'s Ex. 67, Delf, is used to distribute coal to the freight service in Complt.'s Ex. 83, Delf. In locomotive repairs the road switching mileage goes in, to make an assignment to freight.

DELF.

Direct:

The amount of stores and supplies as shown by the annual inventory was 1910 $264,256.74; 1911, $246,908.23; 1912, $340,057.74, 1913, $362,503.16. Those figures are corrected somewhat from figures I furnished Mr. Riggs. We have eliminated some rail loaned to other parties. These figures are as of June 30, each year.

(Witness produces statement showing statistics for Mackinaw Trans. Co. as follows:)

Statement of Earnings and Expenses of Mackinac Transportation Co. and Payments Made by D., S. S. & A. Ry. Account Boat Replacement.

Mack. Trans. Co. Accts. for	June 1, 1909, to Apr. 30, 1910.	May 1, 1910, to Apr. 30, 1911.	May 1, 1911, to May 31, 1912.	June 1, 1912, to Apr. 30, 1913.
In D., S. S. & A. Accts. for	1910.	1911.	1912.	1913.
Mack. Trans. Co. Gross Earnings:				
Passenger	$38,278.77	$43,506.69	$45,711.76	$44,060.50
Mail & Express	3,378.52	3,304.25	3,472.77	3,710.18
Freight & Miscl.	2,039.78	2,852.87	4,942.03	3,171.89
Total earnings	$43,697.07	$49,664.41	$54,126.58	$50,942.57
Operating Exps. & Taxes	$102,443.89	$96,323.17	$102,175.45	$107,920.62
Earnings in excess of *earnings*	$58,746.82	$46,658.76	$48,048.87	$56,987.05
D. S. S. & A. proportion of net expenses	$16,380.28	$9.332.17	$11,899.08	$18,210.80
Payments made by D. S. S. & A. Ry. Co. toward Boat replacement fund	$10,833.33	$10,000.00	$10,833.33	$10,833.33
Special payments made by D. S. S. & A. Ry. Co. on new boats	.....	.....	$7,297.87	$40,078.13
Total paid by D. S. S. & A. Ry. Co.	$27,213.61	$19,832.17	$30,020.28	$69,222.26

The special payments by South Shore on new boats in years ending May 31, 1912, and April 30, 1913, were in addition to the regular monthly contribution to the boat replacement funds, accumulated since June 1, 1906. The Mackinaw Trans. Co. in 1888 purchased the steamer St. Ignace which was retired from service March 1913. They purchased the steamer Ste. Marie in 1893, she was in service until June 1912. Since June 1906, the three owning companies had each contributed $10,000 a year to furnish a fund for the purchase
484 of new boats. The Wawatan, put in service Oct. 1911, cost $389,853; the boat replacement fund which had been accumulated, was applied in payment; it was necessary for the owning companies to make additional payments and in the fiscal year 1912 $7,297.87 was paid by the South Shore on the Wawatan. Previous to 1910 the South Shore had paid into the boat replacement fund $30,000. The balance of the cost of the Wawatan was provided for by bonds for $184,000.

The new steamer, Sainte Marie, was put in service March 1913, and cost $278,660. The South Shore, June 1, 1912 to April 30, 1913, contributed cash on account of that steamer $40,078.13, and an equal amount was contributed by the other companies; the balance of the South Shore and G. R. & I. proportions was obtained on notes.

The number of freight and passenger cars handled by Mackinaw Trans. Co. the passenger cars including baggage, express, diner, sleeper, etc., cars, was:

	Freight cars.	Passenger cars.
1910	46,299	4,919
1911	49,578	5,304
1912	48,456	6,398
1913	46,092	6,045

For number of passengers I have no figures except for year ended June 30, 1911; that would not take in local passengers, paying their way across and not traveling on through tickets. There was: total 67,254 passengers transferred in connection with business interchanged with D. S. S. & A. of which 53,017 or 78.8% were intrastate, and 14,237 or 21.2% were interstate.

DELF.

Recross:

The earnings shown are the totals received by the Mackinaw Trans. Co. for transportation of all passengers across the
485 straits, including local passengers not travelling on through tickets. The operating expenses and taxes shown are those for the entire ferry.

The amount stated as passenger, mail freight and miscellaneous earnings on the statement were used to reduce the operating expenses to get at the net; they were not used to arrive at the division. The net expenses of the Mackinaw Trans. Co. are borne by the three companies in proportion with the earnings of each of the companies on

freight business that is transported across the Straits for them bears to the total of such earnings.

The basis of the division takes into account the revenue for the entire haul on that business which is carried to the ferry by either one of the three railroads, and the South Shore proportion of the net expense is that which is again reduced by charging off some part of that to the Soo Line. The items which are stated opposite the D. S. S. & A. proportion of net expense, is that left after the Soo Line proportion has been taken out. The Soo Line proportion does not enter into the D. S. S. & A. expense at all.

DELF.

Redirect:

The business on Dead River Branch, July 1, 1909, to June 30, 1913, was:

	Loaded freight cars.			Passenger cars in and out (each).
	In.	Out.	Total.	
1910	322	206	528	133
1911	76	213	289	188
1912	31	25	56	105
1913	189	121	310	144
Total	618	565	1,183	570

The loaded freight car mileage would be 2,957; assuming an empty car mile for every loaded car mile; it would be 5,914; the passenger car haul from switch to fair grounds is 1.5 miles and
486 passenger car miles would be 1710.

DELF.

Recross:

The total distance from Marquette depot to fair grounds is 2.8 miles. There is no record kept of locomotive miles on this branch; the mileage made there is included in the switching miles.

If you were about to ballast the mine tracks, it is likely the ballast would come from the mines. The ties for use in the mine tracks would be bought out on the line, and from the point of purchase would move to the mine tracks over the common track; the same thing would be true of the rail; they would be moved from the place of storage or from the place of being taken out of other track to the point of use over the common track, and would involve the use of common cars and common locomotives.

The timber for repairing the ore dock might come from west of Duluth, and use the common track from the State Line to the ore dock, or that timber or some of the material might come in from the Soo, and use the common track Soo to Marquette; all structural material for the mine track that was shipped in would be moved over the common tracks; there has been no account kept of the number of tons

of material for use in repairing or constructing the mine tracks and moving over the common tracks. The material used in a freight spur from the point it came into the line or at which it was on the line, would use the common track in moving to the point of use.

The revenue accruing to Mackinaw Trans. Co. from passengers delivered to it, ticketed from points on South Shore and Mineral Range for fiscal years, being the amount collected for coupons of the Mackinaw Transportation Co., was 1910, $15,392.99; 1911, $15,565.06;
1912, $13,154.97; 1913, $18,658.45. This is 50¢ for each
487 coupon or 25¢ for each half fare. I should think the local passenger business on the ferry would be small in comparison.

(DELF.)

Redirect examination:

I have made statements, Deft.s' Exs. 47 and 48, Delf, for the years 1911 and 1913 of the outside agency expenditures; This shows division between freight and passenger, and inter and intrastate.

The common passenger proportion is divided intra and interstate on the equated passenger mile basis, being in 1911 intra 63.42%, and inter 36.58%; the percentages upon the flat mileage basis, without equation, would be for 1911, intra 60.12%, inter 39.88%. This increases the intra passenger miles 15%; in arriving at the percentage; I think the same reasons apply to an item of this kind as to those having to do with the actual carriage of passengers; these expenses are incurred in securing the passengers and in doing the passenger business. The only common item is the expenses of the Grand Rapids office; the specific reason for adding 15% is that the intrastate passengers produced through the outside agency expenditure get greater service per mile than the interstate passengers. The reason for weighing the intrastate passenger mile is the same in all instances, where it is used; that is that it would cost more.

The real reason why I divide outside agencies on an equated mileage basis was because I applied that basis to the other expenses; I did not give definite consideration to the weigh- of this particular item by itself.

For 1913 the common items of passenger are divided to intrastate, 68.66%, and to interstate, 31.34%, on the equated passenger
mileage; the straight mileage basis would have been intra-
488 state 65.58%, and interstate 34.42%.

DELF.

Direct:

Referring to Defts.' Ex. 47, Delf, the items, common passenger on account of Grand Rapids office, divided between inter and intra on equated passenger mile basis, I think a more equitable division is on the basis of the business from the territory covered by the passengers solicited. The total number of passengers received from G. R. & I., M. C., P. M., D. & M., and G. T. for fiscal year 1913 was

25,583, of whom 23,295 or 91% were intrastate; I believe a proper division of that item would be 91% to intrastate rather than the equated passenger mile basis.

I would not say this was an allocation as the man whose expenses are thus assigned would possibly have nothing to do with those tickets, but he covered the territory in which those tickets were sold, and I think the relation of inter and intra tickets would be fairly measured by the relations of the total business out of the territory covered. The greater proportion of the business we get in this territory we would get without a solicitor; the great majority of the people who buy tickets routed over our line, do not know we have a solicitor in Grand Rapids, he does not deal directly with them, but with the agents of the lines selling those tickets; he makes periodical visits to them and endeavors to have them sell their business over the D. S. S. & A.

There is absolutely no way of telling what business the outside agency soliciting man produces; he does not sell any business and it is only so far as his influence with agents of other lines goes what he is of use to the company.

I believe the more accurate way to divide the common passenger expenses, of the Marquette and Houghton travelling freight
489 and passenger agents, between inter and intra would be on the relation of the inter and intra business represented by tickets sold at South Shore stations in Michigan; of these 1913, 94% were intrastate.

I have taken the number of tickets sold without regard to the length of movement and have included tickets between local points where there is a good deal of business that no other line could get, as well as tickets for interchange business. The travelling ticket agent in Upper Peninsula, I believe visits all stations, and his business is usually with the agent; in many instances with the head of a society arranging for a local excursion, base ball teams, etc.

Complt.'s Ex. 85, Delf, shows for years 1911, 1912 and 1913, ticket sales of various classes on South Shore. This is similar to Complt.'s Ex. 64, McPherson, with minor corrections, and variation as to mileage exchange tickets; the 1911 figures take no account of mileage books, though they were then used.

Assuming that between 1911 and 1913 the number of interstate tickets remained constant, but the intrastate tickets increased 30%, it might, and probably would, have been necessary at the points where the greatest part of the increase occurred, to have increased facilities for selling tickets. I do not know as such facilities were increased between 1911 and 1913; there has been demand right along at the stations for increased help, and in many instances they were made; I do not mean to say that that was altogether due to increase in passenger business. It was an increase in all the business at the station, partly passenger and partly other kinds, and it may have been due to increase in passenger at some point. At the smaller stations I presume the agent can sell 30% more tickets with-
490 out overtaxing him; not knowing the number of tickets sold at each station I could not say at what station he could not

do so; I think some additional help was given the ticket agent at the Marquette station.

There were no changes made at any other stations in the ticket selling forces. The principal number of tickets are sold within half an hour of leaving time. I do not know of any increase in our conductors between 1911 and 1913.

Complt.'s Ex. 86, Delf; a statement showing cost of repairs on each locomotive for each of the years 1910, 1911, 1912 and 1913.

At present there are 196 points on South Shore in Michigan, where freight may originate or be delivered; during fiscal year 1913 there were 200; there are 42 stations on the road in Michigan where there is an agent for the purpose of receiving or delivering freight, doing the billing, collecting charges, and other freight work.

DELF.

Recross:

Our passenger trains do not stop at all those 196 or 200 points; they stop at the 42 agency points and at many stations where there are no agents. There may be a few more passenger ticket agencies. There are *not* sidings at all these 196 or 200 points.

When we discontinue the freight service at a particular station if there is no more business to be had there, the siding would be taken up; in every year some of the points go out and new points come in.

The reason for strengthening our bridges, principally is on account of the increased weight of our motive power—the new
491 engines. I am of the opinion that the bridges east of Soo Junction, and the Carp River bridge, will complete the repairs necessary to carry our new equipment.

On account of each of the replaced bridges, there should have been a charge to operating expenses of an amount equivalent to the cost of reproducing the old structure in kind at the time the new structure was put in.

DELF.

Redirect:

The strengthening timbers on bridges were charged to operating expenses. I believe under a strict interpretation of the additions and betterments account they should be charged to additions and betterments, rather than to operating expenses. The charge was made in the engineering department, and there was a difference of opinion in the interpretation of some of the classifications. That difference of opinion did not arise until after this question came up last week. I believe under the classification the additional strengthening timbers should have been charged to additions and betterments, though it did not bring the structure back to its new condition or value.

Where additional material is put into a bridge to permit it to

carry heavier tonnage, it should be charged to additions and betterments.

Complt.'s Ex. 87 is a statement showing the stational service given at points of origin to less than car load freight originating in Michigan on the D. S. S. & A. Ry. and at destination to less than car load freight delivered to consignees at points in Michigan on the D. S. S. & A. Ry. for the year 1913, separated as between intrastate and interstate.

DELF.

Recross:

Complt.'s Ex. 87 has reference only to service given at point of origin or at point of delivery to consignees on D. S. S. & A.
491*a* It has no reference to service given to a shipment received from or being delivered to another line at a junction point. I have not taken account of the latter service in this statement. The exhibit has no reference to the service through the injunctions, such as at the Soo, St. Ignace, Munising, Shingleton, Ishpeming and Negaunee, and other junction points.

(Defts.' Exhibits 49 and 50, Delf, outside agencies expenses for 1910 and 1912, introduced in evidence. The method of preparation is the same as that applied to the years 1911 and 1913, Defts.' Exhibits 47 and 48, Delf.)

On April 20, 1914.

DELF, recalled.

Further cross-examination.

By Mr. Wykes:

492 As auditor for the South Shore, I make reports for the Soo Union Depot Co. which was organized in 1900 and made its first report to the State Board of Assessors in 1908. The total cost of property to June 30, 1908, is given in the 1908 report, at $114,397.16. That includes real estate, structures, and $500 worth of equipment. The right of way and station grounds cost is stated separately. It is given at $38,431.67, exclusive of buildings. The right of way and station grounds were purchased in 1900 or before, the depot being built in 1900. The cost of the station buildings and fixtures is given at $45,099.23, that was principally the Union Depot. Some appurtenant buildings have been put in since.

The 1913 report shows the cost of property to that date to be $118,634.85; the cost of right of way and station grounds is carried in the latter report at the same figure, $38,431. The report shows that there were no expenditures for real estate or right of way or station ground between July 1, 1907, and June 30, 1913. The total capital stock paid in of the Depot Co. is $75,000. There are no bonds. The assessment of the company is $100,000.

On June 26, 1914.

DELF, recalled.

Further cross-examination.

By Mr. Wykes:

In Ex. 108 in Ore Rate Case (Defts.' Ex. 76 here) I attributed 25.75 miles of the D. S. S. & A. trackage to its exclusive ore business; 8.73 miles of this was treated as main line, and 17.02 miles as branches; the main line is the south or second line Winthrop Junction to Eagle Mills, part of which was formerly used in passenger business; it is not a continuous line, as there is a break in the westerly portion of Negaunee where the Queen mine caved under it; the part that cannot be operated through is a mile and a half or two miles. In Ore Rate Cases I assumed an average maintenance of $500 a mile for exclusive ore trackage covering items of expense under the maintenance of way and structures group. I
493 assumed those expenses covered all that pertained to the ore business; there might be other expenses of those tracks, but we assigned no others to the ore business; we treated those track expenses as the equivalent of $500 a mile. For the entire trackage of the Houghton division I found an actual expenditure for the same items of $913.91 per mile.

Defts.' Ex. 75 and 76, Delf, are Exs. 106 and 108 in the Ore Rate Case respectively.

The D. S. S. & A. receives no part of any sleeping or dining car revenue derived from the sleeping or dining cars of other companies. From the C. & N. W. and C. M. & St. P. we get revenue for permission to them to run their trains over our tracks.

On July 21, 1914.

DELF, recalled.

Further direct examination.

By Mr. Cotton:

Mr. Thompson's division of the item expenses of station employees is not proper. He accepted our allocation between passenger and freight and divided the common expenses for station employees upon the relation that the allocated items bore to each other. It is only possible to make allocation at a few points and at certain points the total expense of station employees was for freight; the amounts allocated to passenger were small. The relation of the passenger and freight business at the stations which are common is not at all the same as it is at the stations where we were able to allocate portions. The time method does not charge enough of the common item to passenger. I believe the revenue train mile basis fairly divided the common expenses and is more nearly correct than the method used by Thompson.

I think the statement of Mr. Thompson, that, considering the equivalent of complainant's entire line in Michigan, there would be a use of such line daily by about 3.6 passenger trains and by about 8.85 freight trains, is incorrect.

494 I have made a computation for each fiscal year, 1910, 1911, 1912 and 1913, and for the aggregate of those years, for both freight and passenger trains. I believe it is correct. It is as follows:

Duluth, South Shore & Atlantic Railway Co.

Fiscal year.					Number of trains per day over equivalent to the entire line in Mich. on which train miles are produced.
1910	Pass.	750,263	÷ 152,931	=	4.905
	Frt.	909,983	÷ 152,931	=	5.945
1911	Pass.	765,460	÷ 152,931	=	5.005
	Frt.	819,900	÷ 152,931	=	5.361
1912	Pass.	733,828	÷ 152,931	=	4.789
	Frt.	801,359	÷ 152,931	=	5.240
1913	Pass.	766,394	÷ 152,931	=	5.011
	Frt.	865,096	÷ 152,931	=	5.657
4 years, 1910-1913	Pass.	3,015,945	÷ 6,111,725	=	4.932
	Frt.	3,395,338	÷ 6,111,725	=	5.550

The mileage of one train each day over track on which passenger mileage produced, for one year of 365 days, would be 152,931 miles. Dividing the freight train miles by that figure would give 5.945 freight trains in 1910, and dividing the passenger train miles by that figure would — 4.905 passenger trains in 1910, that run over the equivalent of the entire line in Michigan, on which train miles produced. The table shows like computations for the other years and for the total of four years, and results. The time ratio 4, of

495 Thompson, I don't think proper, accurate or approximately accurate, to divide unallocable common expenses of maintenance of way and structures where the cost results from weather stress, erosion, decay, etc. My reason is that it does not measure the use of the property by the two classes of service. The time ratio takes the elapsed time of the two classes of trains between terminals and takes into the freight train time 32 per cent of its total time, which is spent at stations doing stational work of various kinds, unloading freight, switching cars and the like and does not measure the use of the remainder of the common property, that is, the property between stations, which is the greater part of the whole; neither does it measure the use of the property at stations, because the greater part of that use at stations is on exclusive freight track. Thompson stated that freight trains travel 16 and passenger 27, miles an hour on the average. The freight train at 16 miles travels 23.47 feet per second, and passenger train, traveling 27, travels 39.6

feet per second. Assuming a bridge of 1000 feet, if 5.55 freight trains passed over in 24 hours, they would travel 5,550 feet on the bridge, consuming 226 seconds, or 3.93 minutes; and if 4.932 passenger trains passed over the bridge in 24 hours, they would travel 4.932 feet over the bridge, consuming 12.5 seconds or 2.1 minutes. A total for the 24 hours of 6.03 minutes out of 1,440 minutes, or .42 per cent of actual time, leaving 99.58 per cent of unoccupied time. The same proposition can be applied to any thousand feet of the track and all the track structure. In my opinion, the weather stress, depreciation and damage thereby, in that 99.58 per cent of time, should not be divided on Thompson's time ratio, but on the ratio shown by my table.

Thompson's time ratio assigns too much operating expense to freight and too little to passenger. To decrease passenger
496 train speed to 16 miles an hour, making it the same as the freight would increase the cost of passenger, but would not put passenger and freight on an equality, owing to the greater time the freight consumes at stations. Even then it would not fairly reflect a proper proportion of those expenses as against the passenger service. Thompson's time basis assigns about 29 per cent to passenger, and my basis would assign about 47 per cent. Before my basis is applied there should be set aside to passenger service any excess of the cost to maintain for passenger above freight service.

I take it that 25 per cent of these weather stress items should first be set aside to the passenger service.

I don't think Thompson's time ratio 4 proper to divide unallocable property between passenger and freight, the reasons being the same I have just given relative to the common items of maintenance expenses due to weather stress. I believe my table, approximately furnishes the ratio on which to divide the common property between passenger and freight, with the proviso that any excess cost of construction for passenger service should first be set aside to passenger business. That answer also applies to unallocatable expenses due to weather stress.

To illustrate, with two trains a day over the entire line, one passenger and one freight, each makes a complete and exclusive use of the entire property, regardless of speed.

DELF.

Cross:

I have attempted to, but have not made, any division of the advertising expenses. I might approximate it by doing some guessing. I don't see how Mr. Heiss could do it and be sure of his work. His guesses may have been a little different from mine. I haven't the result of one month, it was so unsatisfactory, I thought it
497 was useless to go ahead with it. Mr. Heiss took three years. I think, on the division between inter and intrastate, Mr. Heiss' figures are nearer correct than that arrived at by using the revenue train mile basis which we used. He endeavored to allocate

them by assuming that, if the advertising was in a Duluth paper, it was interstate business, and I don't know how he treated advertising in Michigan papers, it might be intra and it might be inter and intra. In most cases the vouchers show the points at which the advertising is done. (It is admitted that Deft.'s Ex. 78, Heiss, "Advertising," are Heiss' allocations and that they represent Mr. Heiss' judgment of true allocations of how they should be assigned and that he would, if produced, testify to them, and to having examined the vouchers for the purpose of making them.) In dividing expenses of station employees on revenue train mile basis, there is no loading of, or addition to, the freight or passenger mileage to represent the time of freight trains in stational work. A considerable number of the passenger trains do not stop at all of the stations. The revenue train miles used in my exhibit to show use are the revenue train miles found in my different exhibits in this case. The results produced by that exhibit bear the ratio to each other that the respective train miles in passenger and freight service bear to each other. This is so, inasmuch as I have divided each one by the same factor. The result of this table and of train occupancy indicated by it is the same percentage as the respective revenue train miles passenger and freight bear to each other. In those train miles is nothing to represent switching, or excess time of freight trains in stational work or the maintenance of exclusive freight trackage. The
498 mileage is not produced on any of those exclusive tracks. The exhibit purporting to show the equivalent number of trains, takes no account whatever of speed; if the speeds of the passenger train had gone up 100%, with the same mileage, the results would have been the same. It would not vary as you increase or decrease the speeds if the mileages remained the same. This table does not represent the actual number of trains you would find on the track if you went out at any moment and counted them; that is indicated by Lindsay's table.

"Q. And if you went out and counted the trains at any particular time due to the fact that the passenger speeds are faster than the freight speeds, you would in fact find a different proportion and a greater proportion for freight than is shown by this table?

A. I believe I do. If we are counting the trains at any moment at different points on the road, the speed would have no effect upon the number of trains at all.

The Master: Wouldn't the fact that the freight trains take so much more time than the passenger, result in your finding more of them on a track at one time than you would of the passenger?

A. That would be uncertain, according to the time of the day, there might be at certain times of the day more passenger trains on the line than freight.

Q. Assume they are spread equally over the line?

A. I don't think you could make a count of that kind and get at any results as to the amount of your entire line which is occupied by your trains.

The Master: We are asking for the fact now, not for results; wouldn't the fact that the freight train moves at slower speed, result

in your ordinarily finding more freight trains on the track
499 than you would passenger trains?

A. I don't know that that would be the case.

(By Mr. Wykes, resuming:)

Q. Let me ask it in another form Mr. Delf: you have 152,931 miles made by a passenger train; you have the same mileage set against the freight train in covering the line once each day for a year. Assuming that the passenger train made its speed twice as fast as the freight train, the freight train would be on the track twice as long, would it not?

A. Yes, it would be between the terminals twice as long.

Q. So to go out and count the trains actually on the track, assuming they spread over the track equally all of the time, the results which you have given wouldn't be the same as the number of trains which would be counted using the track?

Mr. Cotton: I object to that based on false assumptions and as incompetent, irrelevant and immaterial and not proper cross-examination.

A. If your freight train took 24 hours in running from terminal to terminal, and your passenger train took 12 hours running from terminal to terminal, if you took the last—and both started approximately the same time, or the one right after the other, beginning of the day, if you count after the expiration of 12 hours, you wouldn't find any passenger trains on the track.

Q. You would fine one freight?

A. You would find one freight and no passenger. You would find only freights, and yet that passenger train has used that entire track just the same as a freight train.

Q. If you started out in the morning 4.9 passenger trains, and 5.9 freight trains and it took the passenger train 12 hours to make
500 the trip and the freight train 24, at the expiration of 12 hours you wouldn't find any passenger train would you?

A. No.

Q. And you would find 5.9 freight trains?

A. That is true.

Q. So then assuming on your table the passenger trains making 20 miles per hour and the freight trains making 10 miles per hour, to express the number of trains that you would actually find on the track, carrying out this computation and assuming the service spread equally so as to have an equal number of trains on the track all of the time, you would find taking the year 1910, 4.9 passenger trains, and twice 5.9 freight trains would be the ratio of actual occupancy by trains, would you not?

A. No, I think not."

Today is the first time I have testified regarding division of property. I applied the ratio given, in which the results are the same as the revenue train mile basis, but are derived from the number of trains using the equivalent of the entire line. I would first take out

the exclusively used property and to the common apply the same ratio as Mr. Riggs did. This process of separating the property originated with myself. This method of arriving at the ratio originated since Thompson's testimony but the applying of that ratio has been my opinion for a long time. That is, I have been of the opinion that the revenue train mile was about right for the division of the common property, but expressed as I have expressed it today, it came to me since Thompson's testimony. This basis doesn't give any expression to time of freight trains engaged in stational service, as usually and principally that property is allocated to freight.

501 Though there would be some of it that wouldn't be; it would be impossible to separate the stational service and find out what part of it is made on exclusive freight line and what is made on the common line. Whatever greater use there is of the common property in freight switching finds no expression in this percentage. It does not take into account the question of speed at all, and the zone of influence over which the train extends did not enter into my computation of less than one percent. If I use that zone of influence, that less than one per cent, might be extended to two or three per cent. The track is there ready to serve any business that comes along, either passenger or freight and no business can use it except the passenger and freight service of this road.

I believe, in my previous testimony I explained that the excessive cost of maintenance due to the refinements of passenger traffic was an element which would weight the passenger side so as to make the revenue train mileage basis fair. This morning is the only place where I have suggested first taking out the element of so-called excess passenger maintenance; I don't suggest that as to those expenses due to wear. I know a lot of the South Shore ties rot out and there is rail cutting to some extent, though I don't know the extent to which the cost of tie deterioration is due to wear or weather. Deft.s' Ex. 80, Delf, is a statement prepared by Muller in the Western Rate Inquiry comparing the basis of allocation of Operating Expenses to passenger and freight as applied by different accountants in railway rate cases, to each of the 116 primary accounts.

This witness was later called to testify before the court.

502 On October 4, 1912.

MERWIN E. ASIRE, a Witness called by Plaintiff.

Direct examination.

By Mr. Eldredge:

I have lived, and been in real estate business, in Marquette for 31 years, and know value of property there. The 1,100 feet of water front belonging to South Shore, opposite Burt and Ely's Add., described on Complt.'s Ex. 6, Riggs, is worth $10,000.

The 2,200 feet of water front owned by South Shore, inside the Harbor, extends from Washington St. to the north line of Ely lot,

and includes sites of the ore, coal and merchandise docks owned by the company. That property is worth $100 a foot front, or $220,000.

The 800 feet of water front owned by South Shore outside the harbor is worth $25 a foot. The 565 feet fronting on west side of Lake St., Jackson to Mesnard Sts., is worth $20 a foot; the 170 feet frontage, west side Lake St., south of Hampton St., is worth $20 a foot.

The 46 50-foot lots between Mesnard and Hampton Sts., 12 50-foot lots west of Division, at Hampton, and the 12½ 50-foot lots between Jackson and Mesnard Sts., are worth $200 per lot.

The 336 feet frontage on Lake St., Baraga Ave. to Washington St., is worth $75 a foot; the 343 feet frontage on Front St., Baraga Ave. to Washington St., which covers end of South Shore, depot yard, two under and one over crossing, is worth $400 a foot. In that valuation, I have included the property described on Complt.'s Ex. 1, Riggs, as 445 feet frontage on Main St., Front to Third.

The 184 feet frontage on Front, south of Baraga Ave., is worth $200 a foot. The 14,608 square feet on Front to Washington and Main, is worth $40,000.

503 The property described in Complt.'s Ex. 1, Riggs, as 100 feet frontage on Baraga Ave., but which I think should be 200 feet, and that described as 150 feet frontage on Spring St., are worth $12,500, valued together.

The 21 lots, Third to Fifth, are worth $500 a lot, as are the 60 lots in the shop grounds, Fifth to Park Sts. These last two valuations are based on an average from Third to Park, as some of them are not of any value.

The last description, containing 60 lots, is 500 feet by about 1,600 feet; I value this at $30,000, independent of the fact that it is not platted. This figures 60 lots at $500. The 21 lots, Third to Fifth, are not platted. I arrived at their value the same way as that of the 60 lots.

The 34 acre tract, south of Nester Add. west of the shops, is worth $900 an acre, as is the 36 acre tract south of Nester Add.

The land on both sides of right of way of north line,—the one straight up the hill to Negaunee,—from its junction with Dead River railway to city limits, containing 6 plus acres, is worth $200 an acre. The land each side of south line to Negaunee, commencing at Hampton St., and running to the city limits, is worth $250 an acre. The east city limits are about 100 feet further than the section line.

The South Shore runs in Lake St.; from the point where it leaves Lake St., and has its own right of way to city limits (about 1¼ miles), the land is worth $250 an acre.

Frontage on west side of Lake St., from north line of Ely lot to Jackson St. (1,000 feet), is worth $60 a front foot. The frontage on west side of Lake St. from north line of the Ely lot to Baraga Ave. (1,100 feet) is worth $30 a front foot.

504 The property I have valued is owned and in possession of South Shore at present. My values were based on a commercial value at present, or on a value prior to time that railroad was

constructed. There are certain portions of this land that were worth more for residence purposes 30 years ago than today. Those portions are south of Baraga Ave., along the lake shore.

The property immediately south of Baraga Ave. as far as Jackson St., west of that, described as lots, I valued at present value. If the railroad were taken out, the property I valued as of 30 years ago would be worth those prices now, as it is desirable for summer cottages. The other property I have valued commercially, without reference to railroad purposes. The value of the 336 feet frontage on Lake St., Baraga Ave. to Washington, which I put at $75 a front foot, was based on a sale of 20 feet to Robertson, for a blacksmith shop, at about $85 a foot.

The 340 feet frontage on Front St. now occupied by the South Shore passenger station would be good business property if railroad was removed. The lot in Spring St., extended east (about 40 feet frontage on Front St.), is worth $10,000, half way through to Lake St. Take through to Lake St., it would be worth $325 a front foot. In making these valuations, I have given only the naked value of the land.

I now have for sale 1,034 feet owned by Longyear, at north end of our harbor, at same figure ($100 a foot) that I placed on the 2,200 feet frontage on east side of Lake St. The latter is more valuable property; in fact, there is none more valuable in Marquette. I would value the tracks described as 21 lots between Third and Fifth Sts. and 60 lots in the shop grounds respectively at the same figures I have given, irrespective of whether platted or not.

505 ASIRE.

Cross-examination.

By Mr. Wykes:

About 3,000 feet of water front on Marquette harbor, 2,200 feet of which is occupied by South Shore, is available for vessels. The remainder is the Longyear 1,000 feet. No. 4 ore dock shuts out another 2,000 feet between the two properties. I have had Longyear property for sale 5 years at $100 a foot. Its width is from 25 feet to 100 feet, back to M. & S. E. tracks. No Marquette water front has been sold in 10 years.

Mr. Longyear bought the 1,034 feet within 15 years. It is the old Burtine saw mill property, once used for lumber dock. When he bought it, he added to the docks, and it was used for a boat landing. He paid about $100 a foot, and it has been lying idle ever since. He bought it before the M. & S. E. went in there. He already owned adjoining land; Lake St. was there then. There was about a block and a half between his residence and water front.

I haven't had a chance to sell the 1,000 feet in last 5 years. There is no immediate demand; I don't know that there would be any more demand if additional 2,200 feet were on the market.

I included the land the tracks are on and all from Lake St. to water in $100 value. The Munising Railway tracks are west of

South Shore tracks. The only thing I base the value on is that Longyear holds his at $100 and South Shore tract is a little better situated.

The descriptions I valued as of 30 years ago are the piece from north line of Ely lot to Jackson St., another from the north line of Ely lot to Baraga Ave., and another from Jackson to Mesnard Sts.

I am 57 years old; 30 years ago, I was selling peanuts on a train,
and made no sales of property. Marquette, 31 years ago, had
506 4,500 people; today it has 12,000. The land there was within
corporate limits 30 years ago. The streets were about the same as today; 30 years ago, Ridge St. and those south of city were principal residence streets. Then, there was a summer hotel and several cottages about 300 feet north of north line of Ely lot, on Water St.

The description, 1,100 feet water front, opposite Burt & Ely's Add., valued at $10,000, is not presently available for water front use, and has no value as water front property.

Description, water front, outside harbor south of south line of Ely lot, 850 feet, valued at $25 per foot, is immediately south of 2,200 feet; there is on it a building, formerly a roundhouse, and a shanty. Part of shore line here is rugged, rocky and high, and part is quite narrow between water line and tracks, and in water near the shore are one or more large rocks 20 feet across; this 800 feet is outside the protected water front. The 2,200 feet would all fall south of a line drawn at right angles to end of breakwater. The 850 feet and Standard Oil Dock south of it gets some protection from the breakwater; only a northeaster affects them, and they don't get the full force then.

The Spear buildings are on the 2,200 feet. The 850 feet is not devoted to any present use as water front; my value of $25 a foot takes the upland back to the South Shore track, but does not include it. The track is from 50 to 150 feet from the water; there have been no sales of water front property comparable with this.

Description, frontage west side of Lake St., south of Hampton, 170 feet, value $20 a foot; it is 125 feet deep. There is a switch on it, no buildings.

In Lake St. are two railroad tracks, taking half the street; Hamp-
ton St. is 60 feet wide, with cheap cottages on south side, some-
507 what aged, there for 20 years. On Lake Street, south, is a
little better class of houses; can sell 50 foot lots, better located in Marquette, for $1,000 at present; my value of this description was as of 30 years ago.

Description, 46 50-foot lots, Mesnard to Hampton Sts., I valued at $200, present value; they lie immediately west of previous description; valued at $20 a front foot, with a street, and maybe several lots between. 30 years ago, the water frontage was worth considerable money; I don't think these $200 lots were worth that much 30 years ago.

I don't see how I could put a present value on that land now occupied by the railroad; I could only do it by assuming the railroad was away.

I have recently sold lots on corner Jackson and Adams Sts., on Blemhuber Ave. and on Hampton St. Description, 343 feet on Front St., Baraga to Washington, valued at $400 per front foot, average; this is of varying depths. I don't remember the figures I made in arriving at the $400 a foot; I took everything from Front to Third Sts., except the underground cut on west side of Front St. I did not value frontage on Main St., Front to Third, separately, but included it in Front St. frontage. The most valuable part of Marquette is Front St., Baraga to Washington, and Washington, to Third; values on Washington and Front are about the same.

The only vacant property on Washington St. belongs to Wm. O'Meara. I know of no property between Baraga and Third which has changed hands recently. About ten years ago, vacant property on south side of Washington, midway between Front and Third, sold for $150 per foot; I know of no other sales within 15 years, except one, about 12 years ago, on Washington St.

A citizens' committee (in Dec., 1911, and Jan., Feb. and Mar., 1912) made up a roll of all property in the city, and placed
508 values upon it, for the purpose of use in equalization before the Board of Supervisors; the purpose was to find the actual value of the property of the city. The committee was Wm. O'Meara, John Robertson and Arthur Palmer, and was appointed by the Council, of which I was a member. The purpose of the committee report was to permit city to go before the Board of Supervisors and show that the city was assessed at fair cash value; the reported figures were changed somewhat by the Board of Review, which cut it from $10,000,000 plus to $9,000,000 plus, and became the assessment roll, making this roll $2,500,000 higher than the previous one.

The purpose of the committee and Board of Review was to get Marquette on the tax roll at fair cash value; I think it is now under valued; when finished, before review, I think it was nearer cash value. I think this report was fair, and gave approximate cash values of property valued, as far as I know; previously, the city was assessed at 50% to 60% of cash value, parts being on at nearly cash value and balance being low. The idea of the committee was to get whole city on fair cash valuation. After increase in valuation, Marquette was 15% of the valuation of entire county; it was 25% before.

I know of no sales close to the 34 and 36 acre descriptions within 5 years; I have been selling platted acreage for four years just outside city limits, a mile further west, north of brewery.

I have sold 300 lots, four to the acre, at $100 per acre; two or three have been built on. I have no acreage, and know of no sales, near those two descriptions (valued at $900 per acre). I have lots for sale in Nester Add. The railroad property is across the street from some of the lots. The land is platted south of the east end of 34 and 36 acre tracts, with a few scattering houses.

The 12 lots, 50 feet wide, west of Division, at Hampton, are rough, about 25 feet higher than surrounding, and are worth con-
509 siderable less than average of $200.

ASIRE.

Redirect examination.

By Mr. Eldredge:

Dead River branch leaves main line and crosses West End Add. Between that and Park Cemetery is Nester's Add., which is well built up.

On the property east of cemetery and north of Washington are few vacant lots; Washington St. Park is immediately south of Park Cemetery, as are four blocks, well built up, of Nester's Add.

Homestead Add., not shown on Complt.'s Ex. 9, Riggs, lies just south of South Shore property and Nester's Add., and west of H. A. Burt's Add.

Fisher and Rock Sts. extended would run into Homestead Add., where lots, 5.5 to the acre, sold at $200.

I purposely avoided examining tentative roll by committee. In saying that that roll arrived at approximately fair cash value, I judged from the totals and my confidence in the men making the roll; the equalization value of the Board of Review, at $9,000,000, has no necessary connection with the property's true value.

The cheap houses on Hampton St. lots cost from $600 to $1,000.

In stating that I had no other method of arriving at value of 2,200 feet water front than Longyear price, I did not accurately express my meaning; I could put a value on it if I did not know Longyear's holding price. I was influenced by the price he paid, and by the fact that 2,200 feet was more valuable. Without sales, I maye be able to say that property has considerable value, taking into consideration
510 fitness for mercantile purposes; it had the deepest water on the harbor, is located next to business center of the city, and is protected by the breakwater.

If the docks and property of South Shore were taken away, this barbor front is still useful for many purposes; I base my values on all these considerations. There is an immediate demand for this property; when I stated there was no immediate demand, I meant I did not know of any purchaser who wanted it at present.

Description, frontage west side of Lake St. north line of Ely lot to Jackson St., valued at $60, lies east of Champion St.; value of lots on easterly side (1 to 16 of Champion Add., 50 x 100 feet) of Champion St., without improvements, is $600 or $700 each; I know of sales at that price. Value of these lots is diminished by railroad; if railroad were not there, the 1,000 foot could be platted, and lots would be of equal or greater value than those in Champion Add.

Description, 1,100 foot frontage on west side of Lake St., north line of Ely lot to Baraga Ave.; the north end could be used for business, and south end for residence, purposes; the property is not as deep as the 1,000 foot strip.

Q. In reality, then, you haven't put a value on this property of what it was 30 years ago, but you have put a value on it of what, in your judgment, it would be worth today for other than railroad purposes, if the railroad was removed therefrom?

A. Yes, sir.

Q. And that applies to all of the property with reference to which you said that you had valued it on a value of 30 years ago?

A. Yes, sir.

Longyear purchased the 1,000 feet plus all water front be-
511 fore the location of L. S. & I.; the South Shore was then opposite about two-thirds of it.

I have averaged selling 40 lots a year in Marquette for five years, and in two years have built over 120 houses.

ASIRE.

Recross-examination.

By Mr. Wykes:

I would have put the same value on 343 feet of Front St. frontage, had I known it included undercrossing towards Washington St.—approach to No. 4 dock.

On Nester's Add., at least 50% of the lots are built on. The lands I platted and sold near brewery were on N. E. ¼ of N. E. ¼, N. W. ¼ of N. E. ¼ and S. E. ¼ of Sec. 16—a mile from center of city, and one-half mile from settled portion of the city. Champion St. lots are on a very high bluff; the railroad yards are at the bottom of the bluff, towards the lake and railroad tracks, a block away.

Q. Now, yesterday you made your value on three items here, that Mr. Eldredge has just interrogated you about, as being very positive that the valuations were fixed as of 30 years ago, and this morning you change that, and make the valuations as of today; which one of those do you want to stand?

A. I didn't know that I said valuation of 30 years ago. I intended to say that the property was worth more 30 years ago for residence and commercial value than it is today.

Q. Mr. Eldredge's questions and my questions and your answers all indicated that you were fixing values as of 30 years ago?

A. I didn't intend that. What I intended was to say that that property was, for residence and commercial value, worth more
512 30 years ago than it is today in its present condition.

I testified in the Barassa, Martel and Marketti case in Negaunee. I think I put values of $100 an acre there through the swamp lands; I am sure I did not exceed $200. It is about 1.5 miles this side of Negaunee.

ASIRE.

Redirect examination.

By Mr. Eldredge:

I am not as familiar with land values in Negaunee as in Marquette; in Negaunee, my value was with reference to farming purposes, and proximity to Negaunee, and on no other principle.

On January 8, 1914.

ASIRE recalled.

Further direct examination.

By Mr. Eldredge:

Valuing the right of way, from mile post 150.56 to mile post 151.92 (Complt.'s Ex. 1*b*, Riggs, and 1*c*, Riggs). I attach no more value from Chocolay station to the present Lakewood station, .11 miles, than to the sand plains, east of there. From the Lakewood station to the city limits, 1.35 miles, valued at an average of $200 per acre. If that right of way was not used by railroad, it would be used for summer cottage lots. That average value is based on lots I have sold in Lakewood and Riverside Additions. I put a value below the value of the lots. The lots sold at $100 per lot, averaging three to the acre. I sold about 40 such lots, within 6 years. I still own five or six lots, for sale, in Lakewood, and 25 or 30 in Riverside.

Valuing the track rights described under items 4 and 25, in Lake St., I value it, from the point where Lake St. is entered to Hampton St., at an average of 5¢ a square foot, 73,200 square feet, or
513 $3,660. From Hampton St. to the north line Ely lot, 42,000 square feet, at 20¢, equals $8,400; north line of Ely lot to Baraga Ave., 11,820 square feet, at 30¢, equals $3,546; Baraga Ave. to Washington St., 9,180 square feet, at 75¢, equals $6,885. Washington St. east, 22,660 square feet, at 20¢, equals $4,532. Total value for the tract equals $27,023. I took frontage values on the west side of Lake St. at a square foot price, and applied it to this. Those rights could be presently sold, at the price I have put on them, to the M. M. & S. E. Ry., in my judgment.

Mr. Wykes: I wish to object to the inclusion of any value due to the rights in the street, because those are franchise rights that only have a value that is given to them by the earning power of the roads and not by reason of any location or any use of the ground, because the ground belonged to the public.

Item 5 (Complt.'s Exs. 1*b* and 1*c*), Marquette County, is, in my judgment, worth $5,000. I put twice that value on it. The storm of last November convinces me the water front has very little value there. Items 5 and 6, are worth $20 per front foot on Lake St. I assume that the railroad is taken off this property, and fix its value for uses to which it could be put, basing my values upon what I believe the value of adjacent or nearby similar property. All my values, except where I give another reason, are based the same way. The lots in items 7 and 8 are valued at $200 each.

The right of way from east line of Adams St. to east line of Catholic cemetery is $200 per acre, and there to city limits $25 per acre. From cemetery to the city limits, there have been no sales. In my judgment, it is worth $25 per acre; I previously valued this at $200 an acre.

Item 10, I valued at $800—four lots at $200.

Item 11, I value at $20 per foot front on Lake St.

In my judgment, item 12 is $200 per lot, and item 13 is $30 a foot front on Lake St., the entire distance. The chief value of this
514 tract is in about two-thirds of it, under the bluff, level with Lake St. The other third, in on the bluff back of the Champion St. lots, would have little value. (Stipulated that 1.50 acres lying west of red line across item 13 is not in railroad use.) The total value of item 13 is $60,000. The deduction for part not in railroad use is $5,000.

The value of item 14 is $25 per foot front on Lake St.; the hard land is worth $20 per front foot, without water rights. I add five dollars for water rights. I value land across Lake St. at $60.

Item 15, I value at $100 a foot front on Front St. My previous testimony was an average of $400 per front foot for all the property on both sides of Front St. If I previously valued item 15 separately at $200 a front foot, I was in error.

The value of parcel 16 is $30 per foot front on Lake St. It is not so deep as property farther south.

Parcels 17 and 18 I value at $10,000. My former valuation was a little high. Since I testified last, I purchased a tract on Baraga Ave., across the street from this frontage on Baragar, at $40 a front foot. In my former valuation, I took into account abutting damages. My present value is without reference to damages to other property in any way.

Cadarette testified: The parcel which Riggs, in Compit.'s Ex. 1, and Hansel, in Defts.' Ex. 15, described as 336 feet frontage on Lake St., measures 346 feet. In Ex. 1*b*, the frontage on west side of Lake St., south of No. 5 ore dock, was given as 26 feet. It measures 46 feet. I had page 12 of Ex. 1*c* copied, and rearranged the allocations of item 19, to fully account for the 316 feet thereof, and left item 19 as originally prepared by Riggs, so that now there are two 19's covering the same property.

515 The value of items 19 and 20 (Complt.'s Ex. 1*b* and 1*c*) is $75 per front foot on Lake St.

(Plaintiff concedes that strip of land 40 feet wide, from Front to Lake St., which on the lake is a part of this 346 feet, is not in railroad use. Riggs and Hansel gave the frontage on Front St., Baraga Ave. to Washington St., as 343 feet. It measures 354.2 feet. In item 24, Complt.'s Ex. 1*b* and 1*c*, the actual distances of separate frontages on both sides of Front St. are correctly set forth.)

Valuing the 2,200 feet of water front described in items 21, 22, 22*a* and 23, beginning at the south line of the water front and extending north 745 feet to the north line of Ely lot, the value would be $55 a front foot on Lake St., and the balance $125 per foot. Within those areas, each foot would be of the value placed on it by me. The land throughout the extent of this property has value independent of the water front; this 745 feet, $30 for land and $25 for water; the balance, $85 for land and $40 for water. The land

that I value at $30 per foot is by comparison with land on the west side of Lake St. The land that I have valued at $85 is valued at more than the land on the west side of Lake St., because it has a greater depth and is available for the same uses—for warehouse purposes. It could also be used in connection with docks.

The land east of Lake St. within this 2,200 feet, would have a value if there were no water rights; my price on the west side of Lake St. per square foot, would be higher than on the east side. I added $10 a foot for the extra depth. In valuing this land on the east side, I have considered rental values; the other element was the value of the property across the street. No comparison can be made in the values of this property and that north and east on
516 account of the depth of the water and that no available shore land goes with the property to the north and east. Of the next, 1,800 feet beyond this, only a small portion has deep water in front, and the next 1,100 feet has little solid ground; it is all water. The last parcel is probably from 20 to 30 feet, between Lake St. and the water. The first part, the half adjoining onto the railroad land, I estimate about 30 feet of land; the remainder is probably 75 to 100 feet of made land.

In item 24, the frontage on both sides of Front St. occupied by the No. 4 ore dock approach would be $250 a front foot, and the frontage on the east side of Front St., occupied by No. 5 ore dock approach, would be $200 a front foot.

Item 26 is worth $250 per foot front on Front St., about 120 feet deep. In all instances where I value on Front and Lake Sts., and plaintiff owns all the way through, I give half the depth to each street.

In valuing items 27 and 28, I would figure Jackson cut to be used for street purposes, and $200 per foot on Front St., with a depth of 124 feet, the remainder to be fronted on Main St., at an average of $200 per front foot—total, $120,740. In my judgment, that represents the fair market value of that property at present if devoted to other than railroad uses.

Mr. Wykes: I wish to object to the method of valuing the back half of the last description, because it assumes conditions which do not now exist. The problem is to determine the value of this property by the values of the adjacent property; but the value as placed by this witness assumes a new set of conditions, the opening of a new street, and the figuring of a value on the back end of this with reference to putting it in the same condition as the main street of the town, and does not value it by its comparison with the adjacent property, which is the property nearer to Third Street.

517 In my judgment, item 29, included with that portion of item 24 on the west side of Front St., is of the value of $40,000. I would change the depth of the property fronting on the west side of Front St., in Item 24, to make that 100 feet in depth, and use that remaining 27 feet in conjunction with the 14,000 square feet. I would not change the value of the 38.7 feet, $250 per front foot. It is worth just as much for 100 feet deep. I would

increase the square feet in item 29 by 27 times 38.7, and value 15,653 square feet at $30,325—a little less than $2 per square feet. I would utilize that property in enlarging the stores on the south side of Washington St., which are all shallow—near Front St., about 60 feet deep, and at Third St., about 80 feet.

(Subject to objection as hearsay and secondary.) In order to arrive at values, since testifying the last time, I have talked with tenants, and asked them what additional rent they would pay providing they had a rear entrance to their store, or the store increased in length, and have verified my statement upon the rentals they said they would pay. There isn't any question that that property could be sold for the price named.

Item 30, including the site of the new freight house, is worth $50 per front foot on Main St. extended about 500 feet front. If the railroad were removed, I would extend Main St. west from Third to Fourth. I think that would leave all this description on the north side of Main St., except a triangle next to Third.

Mr. Wykes: Before he answers, let that be subject to the same objection that I made to his other extension of Main street in front of the station property, made yesterday.

On an average depth of 100 feet, it would have the same value on Main St. Main St. would be 60 feet wide—the original
518 width.

I base my price per foot on sales of property this last year on south side of Washington St., Third to Fourth. Mr. Goldberg paid $1,250 for a 25 foot lot, and Anton Manthei sold a 50 foot lot for $2,500, both vacant. I put the same value on this property as on Washington St.

In my previous testimony, my value of $500 a lot was an average value, all the way through, as residence lots, including the shop property. I didn't at that time intend to place $500 a lot on that particular property. It was treating it as a whole from Third St. to and including the shop. The prices now put on would not be as residence property. The extension of Main St. would make it desirable for business purposes, the same as Washington St. If the railroad were removed, the property could not be utilized to bring about a substantially similar value as by extending Main St. with a frontage on Third St.

Mr. Wykes: I object to it as not being based on the proper conception of value, or of a method of fixing value. The property at present is affected with the condition, the railroad there, the kind of property that would be in a railroad yard, and it cannot be valued as an entirely different kind of property, with the railroad away, not fronting on Third street.

You would have two frontages, one on Third and one on Fourth, with great depth—500 feet. I don't think any property adjoining the railroad, Third to Fourth Sts., north of the track, is depreciated by proximity to the railroad. All lots on Washington St. abut the railroad and this property.

I value item 31 in the same way, by the extension of Main St., at $25 a foot front on Main St. projected 60 feet wide. These lots would come on the north side of that street, and very little would be taken out of the railroad property. If I testified before as to the separate parcels, and made all $500 a lot, I was mistaken, and
519 wish to correct it. I base my value of $25 a foot front on Main St. extended on a diminishing value from the center of town and on the prices asked for property in the same block on Washington St. I don't think there have been any sales in that block, but this value represents my judgment and what owners are asking. For the first corner, they are asking $50, and toward the west end of the block on Washington one lot is now offered at $25, but there have been no sales.

Parcel 32, I value at $250 a lot, or $1,500 per acre—lots about 50 by 125. I previously valued this property at $500 a lot, as I averaged the property from Third St. west.

Of item 33, except 1.38 acres, the lots fronting on Washington St. are the most valuable. The 4.09 acres is probably $1,500 per acre, on an average. The average of the whole thing is $650 an acre to Lincoln Ave. and $200 per acre from there west. The property on Seymour Ave. is one-half the value of Washington St. property. The second block on Washington St., in the Nester Add., is about one-half the value of the first. (Subject to scale of map, it is agreed that Ex. 1 should have stated 72.46 acres, instead of 70.46.)

The right of way of the Dead River Railroad, north Marquette, items 36 and 37, is worth $200 per acre. I put the same value on lands occupied by the mill tracks, North Marquette.

I have been in the real estate business in Marquette 26 years. I have been personally interested in eight different additions, and during that time have bought and sold property in all parts of the city, not less than 800 parcels altogether; also three additions at Chocolay.

520 ASIRE.

Cross-examination.

By Mr. Wykes:

I put Lakewood Add., at Chocolay, on the market four or five years ago—one row of lots from 240 feet to 700 feet in depth, with frontage on a bayou or Lake Superior. The lots run back to a 60 foot street parallel to the railroad. There are 17 or 18 houses on that plat. Every lot has a water front, either bayou or Lake Superior. I still have three or four lots for sale at $100 to $150 a lot; $100 was the original price. Where I placed a value of $200 an acre starts in the the center of Lakewood, and that is only 13 lots until we run out of Lakewood, and then the right of way is so close to the river or the bayous that it would have the same value as Lakewood or Riverside.

Riverside, on the market about four years, is on the river—51 lots, about one-half sold. The country adjacent to those additions is flat—nothing but pure lake sand. In buying a plat, and selling

lots, we figure the retail price will be four times what we pay for the property. That covers the cost of platting and selling, carries the investment, and leaves a profit. That is, in buying suburban property. On any addition, there is, incident to platting and putting it on the market, the waiting for sales, energy used in making sales, taxes, and things of that kind; so we must buy it in block much cheaper than we get for the individual lots. I sold those lots one-fourth down and $10 a month, with 7%. The 7,100 feet that I valued runs to the city limits. Lakewood is on the north side and Riverside on the south. The railroad divides them.

In order to utilize the right of way through this 7,100 feet at the prices I have named, it must be united with the land on the sides. That is true of all these narrow strips I valued. I assume they would be united with the adjacent lands, with the exception of these parcels in Marquette that are blocks. I don't apply of necessity,
521 that to blocks or lots in Marquette. I based my prices on description 3 on the Lakewood prices. There are no lots adjacent to this strip until you get just where they enter Lake St., and then there are lots across the street.

In getting my price of frontage for items 4 and 25, I took prices on the west side of Lake St. I figured, to obtain the 5¢ per square foot applied to 3,660 feet, the average prices of lots in Burt and Ely Add., which ranged from $200 to $400. I figured the square foot area, and divided it into the prices. I didn't use any particular lot. I know what the asking price is and what lots have been sold for in Burt and Ely's Add., and on that I base my judgment. The lots are about 125 feet deep. A number of lots extend up the hill, so I think, in figuring, I took 100 feet in depth. I think they are nearly all 50 foot frontage. I cannot tell where the lots were that sold for $400, nor where they sold for $200, nor what the proportions were. There have been few sales in that addition in late years. I have had, for two years, 10 or 12 lots then listed for sale at from $200 to $300.

That plat has been on the market 25 years; 60% to 75% of the lots remain unsold. There were no sales, to my knowledge, in the last year. I don't think I have made any in four or five years. A brewing company sold a lot there; I couldn't say when.

Marquette has grown in the last five years, but all to the north. Any growth to the south has been limited to filling in a few houses in territory already occupied by houses. On Burt and Ely's Add., there have been no buildings built in the last five years. The last census shows 12,500 for Marquette, and the last previous census 10,050. Probably 30 new houses have been built during the last year. There are a great many lots around Marquette not yet sold. There are a number of plats lying to the north of what is shown on Ex. 6*a*. I have about 200 to 300 vacant lots listed with me
522 for sale. I had exclusive sale of those listed with me.

I got the price of the track rights, upon which I placed 20¢ a foot, from the abutting property on the west side of Lake St., south of Hampton, and the first parcel north of Hampton. I based it on one sale, which is the only sale I know of on Lake St. That is in

the Edwards Add., on the property marked on the map, "Addn." with a "1" above it.

The entire 208 feet was sold. I used 175 feet depth, in figuring my square foot basis; the same of the property south of Hampton. I arbitrarily fixed the proportion of the price attributed to the front part of the lot. I did not reduce it to figures. I attributed $20 a foot to the Lake St. frontage sold. In fixing my 30¢ price for track rights, I had no sale, but fixed that with reference to my own values. The same is true of my 75¢ price. I did not fix that with reference to sales. There was a sale in that district of a blacksmith shop to Mr. Robertson, seven or eight years ago, for $85 a front foot.

The first building along Lake St. from Baraga Ave. north is a second-class hotel, on the corner of Baraga and Lake; the next is a dwelling; then an unoccupied store building; then a warehouse; then a dwelling house; then the blacksmith shop; and then the property of the South Shore, which is vacant until you come to the little office building. Those are just ordinary dwellings, renting at from $10 to $15 a month. My price of 20¢ from Washington St. east was not based on sales; it is my judgment. I do not know the nature of the rights of the South shore in Lake St.

"Petition of the Bay de Noquet & M. R. R. Co. praying that they may be permitted to lay a R. R. track on Lake Street south to the Carp River and N. & E. to Light House Point, was presented. On motion Mr. S. P. Ely, Agent of the Bay de N. & M. R. R. Co. was allowed the privilege of setting forth the advantages of the privileges asked in said petition. On motion the prayer of the said petition was granted as amended by the Council as follows, to-wit: Right and privilege is granted to the Bay de N. & M. R. R. Co. to lay a railway track on the East, or water side of Lake Street, and to use or occupy said R. R. track, (reserving to the Village for general road bed 30 ft. from the sidewalk, on the West and South side of
523 said street), together with turnouts and crossings as may be necessary for the convenient use of the same, by proprietors of manufacturing establishments, or the general public along the whole length of said street within the Village limits, from Light House Point to Carp River.

I hereby certify that the foregoing is a true copy of certain proceedings of the Common Council of the Village of Marquette at a meeting held June 14, 1869, as found in the "Record of Village Proceedings" of said Village, Liber A, page 59.

Witness my hand and official seal at the City of Marquette, Michigan, this 31st day of December, 1913.

[SEAL.] DANIEL S. DONOVAN,
City Clerk, City of Marquette, Michigan."

"At a special meeting of the Common Council held June 23d, 1869, petition of J. W. Edwards & others residents and property holders on Lake Street praying that a reserve of ten feet may be made on the West side of Lake Street for sidewalk purposes, was presented. On motion the prayer of said petition was granted.

On motion the Street Committee was instructed to have the Old Jackson Cut filled up where it passes under Front Street, the full width of the street, at as little cost to the Village as possible.

On motion it was ordered that the Grant made June 14th, 1869, to the Bay de N. & M. R. R. Co. relative to right of way on Lake Street be so amended as to reserve ten feet on the West side of said street for sidewalk purposes, and that the said R. R. Co. shall leave 30 feet clear of the sidewalk on the East for general road bed.

Sept. 4, 1869. On motion the Street Committee were instructed to investigate the matter of building a bridge on Front Street across the old Jackson Cut, with plans for the same and estimates of cost and report the same at the next meeting.

I hereby certify that the foregoing is a true copy of certain proceedings of the Common Council of the Village of Marquette as found in the "Record of Village Proceedings" of said Village, Liber A, on pages 62, 63, 64 and 78, respectively.

Witness my hand and official seal at the City of Marquette, Michigan, this 31st day of December, 1913.

[SEAL.] DANIEL S. DONOVAN,
City Clerk, City of Marquette, Michigan,"

524 My valuation was based on the assumption that the company had something they could sell or transfer. I came here in 1881. That property was then in possession of the M. H. & O. R. R., and has continued in their possession ever since. I valued this as a railroad right, the value of it to the company for railroad purposes, rather than something that could be sold for commercial purposes. I made no examination of the earnings of the company, or anything of that kind, to see what it would be worth on that basis. I took into consideration and applied prices fixed by sales of the fee adjoining.

I fixed the value of item 5 with reference to adjoining lots and its water front. The price is dependent on my judgment. I didn't do any figuring to arrive at that as regarding lots on Lake St. I think the footage value of adjoining sales could be used.

In valuing item 6, I used the sale, referred to before, by which I fixed the 20¢ price for track rights. This piece is nearly 400 feet south of that. My price assumes the railroad track to be taken entirely out of that territory. If it remained within 100 feet of those lots, they would still have that value. I don't think it would make any difference for residence purposes. The lots would be just as desirable, with a railroad track adjoining the property, for manufacturing, or any business that might want to locate, that required a sidetrack.

We have no land in Marquette on the lake shore west of Lake St. that is level, for manufacturing purposes. The new manufacturing plants have been obliged to go to the north of the city. For residence purposes, the presence of the railroad in the immediate neighborhood takes off some of the value.

I assumed the lots in item 7 would be residence lots. To make

them salable at the price I fixed would require the removal of the railroad. If railroad structures were left immediately adjacent, the land would still have the value I fixed for residence purposes,
525 as the lots are of that value, on the south side of Hampton St.

The value I placed on item 10 assumed the removal of the railroad and the return of the description to the adjoining parcels or lots, which are held by different individuals. There would be a good deal of work involved in getting rid of those and arranging transfers, as each adjoining lot is held separately. As it lies there in the shape it is, I cannot conceive of any value it has except for railroad purposes. I did not take these difficulties into consideration in fixing the values; I do not think I ought to. I think they are worth the prices I have fixed on them.

I assumed the lots in item 12 would be used for residence lots, which would involve the removal of the railroad, but would not involve its removal from item 11. The class of people that will live in that district will not always be affected by the railroad. They will not always locate elsewhere if they can get land at the same price. Men working for the railroad company prefer to be close to their work.

I had no sales to assist me in fixing the value on item 13. I graduate that value down from my prices in the center of town. The next sales to that tract that I had was the Robertson blacksmith shop on Lake St. on the north and the Edwards property on the south. Item 13 is the only piece of ground level with Lake St. that could be used for manufacturing purposes west of Lake St. The Edwards piece is in the second block south from this property, and the Robertson piece about 3 blocks north. In order to make item 13 available for manufacturing, you would have to assume a railroad remaining on Lake St.

I got my price on item 16 in the same way. It is more valuable, being closer to the center of town, but not as deep.

526 In valuing items 17 and 18, my price was induced by a sale, right across from it, on Baraga Ave., 30 feet out of lot 17 or 18 on block 2 of C. I. & M. Add. The buildings on the south side of Baraga Ave., facing on the railroad, are store buildings, except a livery stable. Those next to Front St. are poor; after you pass the livery stable, they are a better class of buildings—fire proof buildings after you pass lot 20 of block 2. I put a value of $12,500 on these two pieces, before taking into consideration the severance damage. I still considered these parcels would have some value by reason of the facility with which they could be added to the adjoining property, and we have taken an average frontage, reducing the actual frontage. I took both parcels to average a piece of 200 feet frontage by 100 feet in depth.

I put $2,000 on the Spring St. corner of Spring and Third, and $8,000 on the Baraga Ave. The first building west from item 17 is a fireproof store, used for meat market and harness shop. The buildings west of that are wooden dwellings, moderate structures, some unpainted. In figuring this irregular tract, I only take into account

so many feet frontage on Third St. and so many on Spring. I would not take more than half the frontage on Third. There would have to be some work done on that track to get it into shape in connection with other lots, which work would have to precede its being sold to advantage. I value it as it is now.

I got my figure on item 19 from the Robertson sale, the only one made on Lake St. I don't think there is any other property for sale on Lake St. Those old houses on Lake St., toward the south end of that block, would not bring a rental to pay a return on that value. There have been no new structures in that block on Lake St. within 10 years. What I have just said in regard to item 19 applies to item 20.

527 On the 2,200 feet of water front, on items 21 and 22, I added $10 a foot land value to the value on the west side of Lake St., and the value of the water frontage is my judgment, scaling it from the center of this tract south. The water front at the center would be worth more than further south. There are two other sales I know of on the west side of Lake St. One is on the corner of Main and Lake, to the L. S. & I., 110 feet on Lake and 140 on Main, with a structure on it, for $7,500; the other is on the corner of Washington and Lake Sts., to the L. S. & I., 278 feet on Lake by 105 on Washington, with a two-story structure, now used for the depot and general offices, for $50,000.

I valued item 24 as half way to Lake St. on the east side. In my estimate of $40,000 from Front St. to Third, I estimated this at 100 feet depth fronting on Front St., which would be of the same value as 124 feet, in my judgment, on parcel 29. The depth of the stores on Washington St. is 94 feet at the corner of Third, and narrows down, on the curve, to about 55 feet at Front—74½ feet average depth. About 200 feet east of Third St. would be 90 feet in depth.

In uniting the Jackson cut to item 27, and using item 28 as a street, I did not take into account that there was something like 10,000 yards of excavation in that cut. It wouldn't cost anything to fill the cut, if we were to use the property in the way suggested. The excavating of the basements for the store buildings fronting on Front and Main, together with other basements that would be excavated in a radius of six to eight blocks, would fill the Jackson cut. I can't answer how many years it would take to fill it in that way. It would not be necessary to construct that street, to build on Front St., and the excavating for your buildings on Front would fill in a considerable distance back on Main St. I assume a sale of this property at these prices in a reasonable time. The problem, as I stated it, assumes the sale of the parcels, the digging of cellars and putting in of structures, in the near future.

528 I recall two new buildings in the business section on Washington St. in the last five years. There are no vacant lots on Front St. The one on the south side of Washington St. opposite the Mining Journal was built about three years ago, by Fred Donckers, and the other one, on the north side, this last year. I only recall two other new business buildings within a quarter of a mile of the South Shore station in the last 5 years, on Washington St., between

Third and Fourth, south side. Within a radius of half a mile, there have been two grocery stores in the residence section erected on Third St., north from Washington. The building constructed by Marquette National Bank was finished two years ago. The station site would make 21 lots and 10 feet on Main St., and the frontage of about 140 feet on Front St. The stores in town vary from 18 to 25 feet wide.

In the industries of Marquette, outside the railroad, we have a sawmill, employing probably 50 men; stone quarry, 25; Mining Journal Printing Co., 25; Lake Shore Engine works, about 150; Longyear & Hodge, 20; and the two rock crushing concerns, 75, in the summer. There are quite a number of things that employ labor. It would take some little time to think of all of them. There is our life saving station; and the boiler works, 12 to 15 men. I assumed the property two blocks west of the station, and the frontage on Front St., Baraga Ave. and Spring St., would also be used for business. There are no vacant lots on Front St., in the business section, except the property owned by the South Shore.

There have been sales in the residence portion. There was a price of $3,000 for 50 feet between Bluff and Ridge Sts., on the east side—the side opposite the library,—about 150 feet up the hill.

529 In valuing items 27 and 28, I averaged the entire distance from Front to Third at $200 per foot. The value would diminish as you went west on Main St. to Third, with the exception of the corner. I did not locate my values. I just made an estimate, from the value of Washington St. property, that the property on Main St., handled this way, would be worth as much as the property on Washington St.

The two principal business streets of the town are Front and Washington. The last sale on Washington was next to the Opera House—$9,000 for 48 feet, or $187.50 a foot. I would value the lot on the south side of Washington St., next to the corner of Third, at $135 a front foot, which is the valuation I would place on the corresponding lot on Main, if that change were made. The $9,000 lot occupied by me is 150 feet deep, but only 110 feet is used. That was the last vacant lot in that block on Washington St. On Washington St. immediately west of that block, and directly north of item 30, are the postoffice and the city hall. The lot sales directly north of item 30 on Washington are across from the city hall, west about 150 feet. That is where a new building is going up. I apply the Washington St. prices to the property on new Main St.

When I get farther out in the country, on description 33, I give the Washington St. frontage a value of more than twice the value of the property just off of Washington St. That property is so far from the business portion of town that it would not be used for business, and is not nearly as well located for residences as the Washington St. property.

In the prices I have fixed for that part of the property available for business, if the railroad were moved, I did not assume all those parcels would be sold at the same time. I think there are eight build-

ings on Front St., Washington to Baraga, occupied as saloons,
530 and three on Washington St., in the first block off Front. There are no vacant stores on Front St. today. The property next to the livery stable, once used for a moving picture gallery, has been out of use a few months. I asked tenants on Washington St. how much additional rent they would pay to have a rear entrance to their stores, or the buildings extended. Delf said he would be willing to pay $5 a month, simply for the rear entrance, and the moving picture man said he would be willing to pay a considerable addition if he could have his building extended. No one else named the amount of money they would pay. I interviewed none of the owners.

In valuing items 30 and 31, I figured 500 feet at $50 from Third to Fourth, and 526 feet at $25 from Fourth to Fifth, and the triangle, about 50 feet on Third St., at $50—total $41,550, as compared with previous value of $10,500. If the railroad was taken out in order that the other parties could handle their land, they would have to have the street just the same as this land; so I made no allowance for street. It is my understanding that 20 feet of the proposed street would be on railroad property. I assume that the adjoining owners would join in putting a street through, without cost, and give the other 20 feet. The 40 feet between Third and Fourth St. all comes out of the railroad company. Before you get to Fourth St., you must run out of railroad land, if you continue Main St., and the land that abuts that on the south will be equally benefited with the railroad lands, while the street all came out of the railroad land. After you pass Fourth St., 20 feet must come out of adjoining property, and 20 feet out of the railroad company. I do not care to change my value on 30 or 31.

I do not remember of ever saying that it was necessary to give the entire width of description 29 to the lots fronting on Washington St. Some of it would be applied to property that fronts now on Main St., and the property at the west end of this cut would have
531 a rear end, which they need. It might not be necessary to increase the length of those stores, because the stores at the west end of Washington St. are much deeper than at the east end. In my estimate of the value of parcel 29, I contemplate adding some portion of it to lots that now front on Main St. For the purpose of the building fronting on Main St., the land would not have a value of $2.50 a square foot. That was my average figure. It would have to be scaled. To determine a fair valuation, I have applied to that strip Washington St. prices, as indicated by the value of the lot under the building I am now in, in conjunction with the rentals that would be increased, to determine a fair valuation of it. The property used by the building I am in is $2 a square foot, for 100 feet. If we took into consideration the entire 150 foot lot, it would be less.

In order to get the price I put on item 32, it would not be necessary to acquire the narrow lots on the north on Washington St.; $1,500 per acre is only $250 per lot, and that could be subdivided by putting in streets, and sell at that figure. To plat it to advantage, it would be better to run the streets through it, so as to make Sixth and Seventh

Avenues continuous. That would involve purchasing some of the short lots. You could enter it from Fifth St., and plat cross streets that would conform with these streets, which could be opened later on. You would then have an opportunity of getting out to the east and south. You would want to plat it, so as to give lots at least 120 feet in depth; which way it would plat to the best advantage, I could not tell without figuring. A street running east and west, lengthwise of the property, would be necessary, and two cross streets, 66 feet wide.

In fixing my values, I have first assumed the taking of the property out of railroad use. Where I found a strip of right of way not big enough to plat, I treated it as going to the adjacent property, and fixed my value on that basis. In putting a value on item 30,
532 I assume that items 27 and 31 have also passed out of railroad use and go to commercial purposes. I also assume demand for this property. There would not be a demand for that entire property immediately. It is impossible for me to say how many new business places could be utilized at the present time, but I do know there is a demand for more business places in Marquette. We had an application within a month for a retail and wholesale candy factory; we haven't any property for them. This concern wants a store where they can retail candy. It would not be a good location for it on Washington St., across from the postoffice, because the bulk of our better stores are located nearer Washington and Front.

Assuming the reconstruction of the railroad yard, the property on Front St. would be used first, and, as soon as that was occupied, the property on Main St. ought to be as desirable as Washington. The business center at the present time is the corner of Washington and Front The most valuable is from Main St., on Front, to Washington, and then west on Washington to the center of the block. If 600 lots throughout this area of location of railroad property had to be sold in a stated length of time, it would depreciate the value. I don't know about five years; I would not want to fix a period less than five years.

The buildings immediately surrounding the railroad structures west of Third St. are not as good a type as you would find in other parts of Marquette, not affected by the railroad. The railroad affects the buildings and the character of the adjacent structures somewhat. Conditions in that respect in Marquette are no better or worse than in any city of its size.

There has been no marked increase in land values in Marquette since I testified before. There is a general upward tendency in real estate prices, but it is slow in Marquette. There are always some lots on the market cheaper than others. Until those are gotten rid
533 of, the prices cannot go up much. The increase in values is to the north part of the city. In the part of the city along the railroad, it has remained about the same for the past 10 years. Lots and property closer in have come a little closer to a market than a year ago, due to increase in population. The lots I purchased two months ago on Baraga Ave., for $40 a front foot, sold four or five years ago for $50 a foot. The adjacent structures were then about the same.

I base my value on items 34, 35 and 36 on a lot valuation. I diminish my prices from the Nester Add. out. I intended to go to the city limits with my values; at the extreme west end, value is probably $100 an acre.

In my valuations, I have intended to fix the fair market value. If I had 10 acres of land that I could sell for $1,000 an acre in bulk, or could subdivide it and sell it for $2,000 in parcels, I would say the fair market value of the land was $1,000. If you owned 40 acres of land in Marquette, and wrote us what we considered a fair market value, we would fix that value at what we would sell the property for intact. The station ground and adjacent cut would be by the front foot or lot, because that is not a piece to be platted; it is altogether different from 40 acres outside. The value I fixed on the station ground is what it could be sold for in bulk. I would contemplate selling it in three or four parcels.

ASIRE.

Redirect examination.

By Mr. Eldredge:

I would expect to obtain from those three parcels the aggregate which I put on it, and I put on the lots west of Fifth St. what I consider a fair market value. My price there, on that acreage, is what I figure it is worth in bulk. I think it would retail for much more.

534 My price on the right of way from Lakewood station to the city limits and from the city limits to Lake St. was taking that property in connection with the adjoining property. My idea of the price is what it would bring in bulk to be added to the adjoining property.

In the building I occupy, on lot on Washington St. which sold, vacant, for $9,000, there was a large amount of sand at the rear end—from 16 to 18 feet above Washington St., that sloped gradually toward the front about half the distance of the lot. That sand, I thought, affected the value of the lot by $1,000.

The price on item 31 was not based on a bulk sale, but a price it would bring after it had been arranged. The grading, curbing and macadamizing of the street averages about $1.25 a lineal foot. I think a person buying this property would take that into account when buying, and pay the price named. If Main St. were widened in the way I propose, Front to Third, but not beyond Third, my idea of the value of the property, Third to Front, would be the same. If Main St. were extended, Third to Fourth, and not from Front to Third, it would unfavorably affect the value, Third to Fourth and west.

There were 15 acres of the tract on Washington St. originally bought by Hill, Cochrane and Miller, just this side of the Brewery land. West End Add. joins it on the east, but the property they purchased is not platted. They paid $7,500, 15 years ago; $200 an acre is a fair valuation of it. The price I fixed on the property from Fifth St. to the west line of section 23 was a wholesale price, and I would expect the lots to bring considerable higher.

535 ASIRE.

Recross-examination.

By Mr. Wykes:

These lots ought to retail at from $2,500 to $3,000 an acre, or $500 a lot. Lots on Washington St. and Bluff St. sell at that price. There are no lots on Bluff St. less than that, until we get west of this line. Lots on Washington have sold for $800 and $1,000 opposite the shop grounds. I don't remember any as low as $500. I do not think there is a lot on Washington St. east of Park Ave. that can be bought for less than $800. There are a few vacant lots there.

I got the $250 a front foot on the Front St. end of the station property by the value of property on Front and on Washington. The lot on the corner of Front and Main would sell for $250 a front foot. I would expect a less value as you went south. The business center of our town is from Main St. north to Washington, and west on Washington to the center of the block, and I scaled it in that way. The only sales I have are those made recently on Washington St. of a single lot, and not a large tract. I do not know of anything in Marquette of similar character to item 27 that has ever been sold in the shape in which I propose to cut it into three pieces. I did not fix my price with reference to its being divided into three pieces rather than into lots, because I did not have in mind the three or four pieces, but I did have in mind the sale to a party that might take the entire Front St. frontage. I can't name any possible purchaser. I made an estimated value of the land on Front and Washington Sts. adjoining this property, based on rentals, and not from sales; there has been only one lot sale.

536 ASIRE.

Redirect examination.

By Mr. Eldredge:

The growth of the town has recently been toward the north, but rentals on Front St. have increased from Baraga Ave. north. Business concerns aim to get as near Front and Washington as they can. Business has not started up the hill, north of Washington, to any extent. Some of the best stores in town are not south of Main St. Rose's has been improved within three or four months; two new fronts have been put in near there. The railroad track crossing Front St. at Baraga Ave. has a great deal to do with preventing the growth of the town to the south. Before the road was built, Baraga Ave. was the main business street. It is the widest thoroughfare we have, and a fine St., yet, property is not worth as much on Baraga as 30 years ago. I attribute that to the railroad crossing Front St. there.

On July 21, 1914.

ASIRE recalled.

Further direct examination.

By Mr. Eldredge:

I am the Asire who testified in this case previously. I know the plat of East Lakewood. When I valued 7,100 feet right of way of South Shore from Riverside station to mile post 151.92, I did not take into consideration value of land in East Lakewood plat. East Lakewood plat lies east of Lakewood plat, regarding which I testified and of which I was the owner. In fixing value on 7,100 feet, I used lots starting at center of Lakewood and Riverside, taking 13 lots in Lakewood and 15 in Riverside. My prices were all based on comparisons of lots west of center of Lakewood and Riverside Additions and west of lot 13 in Lakewood. The areas of lots in Riverside with which I compared were .78 of an acre and Lakewood 1.10 acres per lot.

537 When I fixed value of South Shore right of way at $200 per acre, I didn't have those lot areas correctly in mind. I stated they would run three lots to acre. Having in mind correct acreage, the valuation should have been $70 per acre, and I would change my value to $70 per acre, to city limits. From city limits west, to Lake street, my values heretofore given stand.

Referring to item 33, (Complt.'s Ex. 1*b* and 1*c*, Riggs, Marquette County, 72.46 acres, extension to shop grounds, I first valued this as 70 acres at $900 per acre. I wish to correct my testimony. I am now at a loss to account how I made some of the answers I did in my second examination. I haven't changed my opinion of a valuation of $900 on the whole tract; dividing the property into three tracts, the first, Park Avenue to Seymour, 25 or 26 acres, I value at $1,500 per acre, average; from Seymour to Lincoln, $650 per acre; and west of Lincoln, $200 per acre. In the first tract, of the 15 acres I was asked to value, I would place part at $2,500 per acre.

The two pieces on Complt.'s Ex. 6*a*, of 4.09 and 3.56 acres, I would value at $2,500 per acre, average; the 7.15 acres between extension of Seymour avenue and shop limits at $1,300 per acre; from Seymour to Lincoln avenue, $650; and west of Lincoln, $250 per acre. The 1.38 acre tract, in track to Sinclair quarry, I value at $200 per acre.

ASIRE.

Recross-examination.

By Mr. Wykes:

The 1.38 acres, quarry tract, is an irregular strip with 50 feet greatest width, extending through lands of others. I wouldn't attempt to put a value on a small piece. I took that as a whole. I wouldn't know how, and it would be difficult, to place a value on a

narrow, irregular piece like that. It wouldn't be worth as much as the same amount of land in a block.

538 As I remember, the second time I testified I placed the land, Park Ave. to Seymour, at $1,500; Seymour to Lincoln, $650. It is the north 7.5 acres, between Park and Seymour, on which I fix $2,500 per acre.

When I get below that, to the 7.15 acres, I called that $1,300. Dividing the Washington frontage into lots, they would range $600 and $700 per lot. The seven acres would have to be cut by a street east and west, and you would get a less price for the lots on that street than on Washington. I fixed those lots at about $300 to $500.

539 On October 5, 1912.

JOHN ROBERTSON, a Witness called by Plaintiff.

Direct examination.

By Mr. Eldredge:

I lived in Marquette 20 years, was once mayor. I have dealt considerably in real estate there, and am familiar with values. I know 1,100 feet of water front of South Shore, opposite Burt & Ely's Add.: in my judgment, its value is $12 a front foot. I know water front property, 2,200 feet, inside harbor, Washington St. to south line of Ely lot; in my judgment, it is worth $125 a front foot on the water. I know 850 feet of water front just south of the 1,100 feet; in my judgment its value is $30 a foot. I know frontage west side of Lake St., north line of Ely lot to Jackson St. 1,000 feet; in my judgment its value is $60 a front foot on Lake St. The 1,100 feet west side of Lake St., north line of Ely lot to Baraga Ave., is worth $30 a foot on Lake St.

Property on West side of Lake St., Jackson to Mesnard Sts., 565 feet, is worth $20 a front foot on Lake St.; frontage on west side of Lake St., 170 feet, south of Hampton, is worth $15 a foot; 46 and 50 foot lots, between Mesnard and Hampton Sts. average in value $200 a lot, some are worth more and some less; 12½ fifty foot lots, Jackson to Mesnard, and 12 fifty foot lots west of Division, at Hampton, would average the same—$200 per lot.

The 336 foot frontage on Lake St., between Baraga Ave. and Washington St., is worth $80 per foot; 16 or 17 years ago, I purchased 17 feet frontage on Lake St. by 65.5 feet deep, next

540 south of South Shore property, facing the Lake, at $1,400; it is worth as much now as then, and the 336 foot strip is of equal value.

The 343 foot frontage on Front St., Baraga Ave. to Washington St., except 14,608 square feet back of stores, I value at $150,000; 184 foot frontage Front St., south of Baraga, I value at $175 a foot on Front St.

The 445 foot frontage on Main St., Front to Third Sts., was included in my $150,000. The 14,608 square feet on Front St., from

Third to Washington and Main, is the back end of Washington St. lots in the cut; it is worth $2.50 per square foot.

The 100 feet on Baraga, and triangle on northeast corner of Third and Spring Sts., are worth $15,000; in fixing that value, I took into consideration the damage to the lots crossed. The property between Third and Fifth Sts., east of the shop, I put at $500 a lot of 50 by 150 feet, and between Fifth and Park Sts.—the shop grounds—at the same.

The value of the 34 and 36 acre tracts, south of Nester's Add. and west of the shops, is worth $900 per acre; the 151.35 acres at north Marquette is worth $32,000, and the Dead River Branch, to north Marquette, is worth $200 per acre, as is the land on both sides of the line.

The south line,—old M. & W.,—Hampton St. to city limits, is worth $140 an acre.

I own 22 pieces of improved and 10 pieces unimproved land in Marquette; I was member of committee appointed by the
541 Council to Make valuation of lands in Marquette.

ROBERTSON.

Cross-examination.

By Mr. Wykes:

I have had six or eight real estate transfers a year in Marquette, in last fifteen years: I had no transfers on Lake St., other than 17 feet mentioned, and none on Front, Washington, Main or Third Sts., in business section. On Baraga, 200 feet west from Front, directly opposite the triangular piece, and between lots 17 and 19, I bought six years ago, giving $1,500 for 30 feet 105 feet deep, and I now own it. The triangular piece, across the street, valued at $50, is of considerably less average depth; I did not consider that; I considered the depreciation—that the damage would be about equal to the value of the entire piece; I considered the property more valuable on that side.

I have had no sales or deals in property near Ely lot; I have had on Champion St., on the first table land—not in hollow with Ely lot. There, Champion is a pretty good street, with a good class of houses, and new ones going in; the price was on White's Add. on west side of Champion St.

The Citizens' Committee, on which I served, began valuation work in November, 1911, and completed March 1, 1912; we estimated a little under the real actual value, keeping 10% to 20% under; that was all the variation we intentionally made.

Q. Did your report read like this; that is, the part of the
542 report that accompanied the roll: "To the Honorable Mayor and Common Council of the City of Marquette: Gentlemen, The Committee appointed by your honorable body to place a cash value on all taxable real estate in the city, wish to report that they have completed their work and the roll has been opened for inspection to the tax payers of the city according to your order, and we wish

to report that we have inspected all the property and placed a fair cash value on same to the best of our knowledge, With this report we turn over the tax roll which we have made. Yours truly, A. H. Palmer, William O'Meara, John Robertson, Committee." Is that it?

A. I presume it is; I don't just recall it now, I think it would answer all right.

The above was read from a printed copy of council proceedings, marked official, and introduced as Defts.' Ex. 3, Robertson, Oct. 3, 1912.

I don't remember that the Longyear description of 1,031 plus feet was valued by our committee at $22 a foot; I don't remember that the Bessie Leggett piece—1900 feet—was valued at $50 a foot. Grace Furnace is immediately north of the 2,200 feet of South Shore property; I don't remember that our committee put $17 a foot on it. If I were to get the value of the 2,200 feet in my own way, I would put $500 a foot on part of it.

543 Q. And yet the property right next to it, your committee in fixing values that you say are 20% lower than cash values, that that is the only variation, fixed a value on the next property to it of $17 a foot; can you explain that discrepancy:

A. Why yes, I can explain it this way: It is the best portion of the harbor that there is, right on this point; as to that, I would put it at five; it has deep water, and it is protected, and there are no floods to bring in sand or sand bars.

Q. They are, both of them, back of the breakwater?

A. Yes, both of them back of the breakwater. This particular spot I have in mind, I would say, would be $500 a lot; it is deep water; never been filled in; there are never no obstructions brought in from storms.

In putting on the 1,100 feet water front in Burt & Ely's Add. a value of $3.30 a foot, the committee was a little lenient, and took into consideration that the railroad was a public utility, for which we had use, and realized at the time we were putting a low value on it.

Q. Did you put a low value on the railroad property at the expense of the other property?

A. Well, our work was subject to the approval of the Board of Supervisors, and if they didn't see fit to approve it, why, as I said before, it was a local affair; we did what we thought we were expected to do, what would be expected of us.

544 Q. Where did you get your instructions to favor the South Shore railroad in your valuation?

A. We didn't get any instructions from anybody.

Q. How did you know you were expected to do that?

A. Well, we know, pretty near long enough, the sentiment of the people of our city; lived there long enough, and acquainted enough with them; acquainted with local affairs, and with politics and political affairs, and otherwise, here—business affairs.

Q. You were going to use this on the Board of Supervisors for the purpose of indicating to them the true value of the city of Marquette,

and in it had values that you now say were way off from cash value; is that the fact?

A. We were going to use nothing on the Board of Supervisors. They were educated, learned, business men, and could judge for themselves. They went over our work; they approved some of it; some of it they didnt.

Q. But you furnished that first to the council as representing your judgment, over your own signature, of the fair cash value of this property, didn't you?

A. Yes, we made a report.

Q. You have answered this morning that the variation was 20%; that is, that it may have run 20% over or under what you would determine was the real value; isn't that the fact?

545 A. We kept on the safe side of any strenuous protest that might came in from the taxpayers, but we couldn't value a piece of property—just determine the exact value of it; couldn't go to a man's house, and go upstairs and downstairs.

Q. So, because the South Shore, you thought, was an advantage to the community, you think on this parcel you put a lower value than you did on some other property; is that the fact?

A. That particular portion down there we did.

Q. Just because it belonged to the South Shore?

A. Not just because it belonged to the South Shore; if it had been any other railroad company than the South Shore, it would have been the same.

Q. Then, if it was a partial exemption extended to a railroad, how does it happen that the next piece, belonging to Caroline Burt, a private individual, is assessed at less per foot, if you simply granted immunity to railroads?

A. I don't recall just what.

Q. Hers is assessed at $3, and this other description at $3.30.

A. What is that description of Caroline Burt?

Q. 198 feet in front of lot 51 of Burt & Ely's Add. Now the Standard Oil—do you know what frontage they have got down there?

A. They have two descriptions; I just forget, now, what it is.

546 Q. They have one description of 180?

A. I believe it is.

Q. And you put a value on that of $13, and that lays this side of the Burt & Ely parcel, does it not, belonging to the South Shore, on which you placed a value of $12?

A. Yes, I think so.

Q. Did you also favor the Standard Oil in the same way that you say you favored the South Shore?

A. I don't know. I don't remember of us particularly favoring the Standard Oil.

Q. That is about right, is it, the amount that you put on the standard Oil?

A. I don't remember; I couldn't recall now.

My lot 30 feet on south side of Baraga, for which I paid $1,500 six year sago, was assessed at $1,200, I think.

In fixing value of property in Marquette, I took into consideration property rented around it, and what it was paying; e. g. north of Spring St. (corner of Front) is a property 44 feet wide, with a poor building, rented at $170 a month.

The values by our committee were given a good deal of consideration; we intended to do faithful and good work, and get 10% and 20% under cash value; the principal exceptions were the railroad property.

The portion of the South Shore water front between Baraga and Main Sts., 700 or 800 feet, is worth $500 a foot on the water
547 front; this was in the strip upon which an average of $125 per foot was placed. I don't remember what value I placed on the remainder; it would probably be 300 feet, Washington to Main Sts. I don't know just what that is worth; I have not gone over it.

Q. About how much?

A. Oh, I wouldn't want to say. I had those figures; put them in separate basis. I would have brought them over; I haven't got those figures.

Q. I don't care to get it down to the last penny; tell me about what you think it is worth?

A. Well, I don't know. Now, I didn't give it very much attention, because I was given to understand that this thing had to be got at an average.

Q. You got it at an average, and tell me how you got your average?

A. Well, I took those valuable portions at a certain figure, and I took the balance at another certain figure.

Q. Isn't it a fact that, taking the 800 feet between Baraga and Main that you say is worth $500 a foot, putting nothing else in at all, the average for the 1,100 feet, taken from the 800 feet alone, would be over twice the figure that you have fixed?

The Master: Do you understand that question?

A. Yes, I understand.

Mr. Eldredge: What 1,100 feet?

Mr. Wykes: I mean 2,200 feet. Let the question go. Did I say over twice? About twice, put it, instead of over. I want
548 it answered—for the entire 2,200 feet.

A. It might be all of it, but there is a portion, I think I said Saturday a portion of it is worth—I don't know just now; I haven't measured it up accurately; there may not be 800 feet.

Q. It was your judgment, when you answered, that it was 750 or 800 feet; that is what you answered, wasn't it?

A. Well, I think I said particularly between Baraga Ave. and Main; that was the valuable front portion. Of course, taking out the footing of the ore docks, there wouldn't be that much; I forgot about that. I didn't give this very much. I didn't suppose I had to give it in detail in this way; I went over it in that way.

The Master: You can tell about the distance from Baraga to Main Street, can't you, approximately?

A. About 600 feet, taking out the dock out of that.

The Master: It would be on the 600 feet you would place a $500 valuation?

A. Yes sir, I would say taking out the dock.

Q. You may take your own way for it, and tell me exactly how you figured out your $125 a front foot?

A. Well, I don't remember, just as I said Saturday, about my other figures, I haven't got them with me; I think I can find them though.

I did not know the Longyear frontage was for sale at $100 per foot; I know, in a way, what he paid for it 10 years ago. I know of no other water front property on Marquette harbor and of no
549 sales, except Longyear parcel, in 15 years, and I know of no one attempting to purchase water front property in 10 years.

My values on upland are fair; I will pay $300 a foot for 25 or 30 feet on Front St.

A 25 foot piece on Front St. would involve cutting into some building.

Defendants' Ex. 4, with dimensions of parcels where they appeared is as follows:

1. A piece of frontage on east side of Front St. at continuation of Spring St. (40 feet wide)	$6,400
2. Overhead crossing on east side of Front St., lying next and north of Fay property	7,000
3. Underground crossing lying next and south of Main St. on east side of Front	8,000
4. Underground crossing on east side of Front St. lying next and south of Marquette County Savings Bank (30 feet wide)	9,000
5. Frontage on west side of Front St. from south side of overhead crossing lying next and north of Schoch & Hallam's store, to the south line of Main St., about 180 feet, at $300 per frontage foot (125 feet deep)	54,000
6. 180 feet frontage on east side of Third St. beginning at
550 the south line of Main, running south, at $135 per ft. (125 feet deep)	24,300
7. 324 feet frontage on south side of Main St. between Front and Third, $125 per frontage ft	40,000
	$149,100

Description, 14,608 square feet on Front St., Third to Washington and Main, $2.50 per foot, is the strip directly back of Washington St. stores. This description goes from Front to Third St., being the approach to the northerly (No. 4) ore dock. The stores fronting on Main St. back to it on one side, and those on Washington on the other. The value of the property consists in its being salable to persons owning stores on Washington and Front Sts., who have valuable frontage, and are hampered for depth; I know it can be sold for the amount I put on it; it is 574 feet, Front to Third.

ROBERTSON.

Redirect examination.

By Mr. Eldredge:

The committee making valuations in Marquette occupied no particular official position. The Common Council and the people of Marquette believed the city was paying more than its fair proportion of county taxes, and the committee's valuation was to show that the Marquette tax roll was the fair value of the property for taxation purposes, together with the fact that we thought there was some property that had been included and was not on. We gave it a thorough going over, with a view to presenting the facts to
551 the Board of Supervisors, so that in equalization Marquette tax might be reduced.

In the beginning, just as you said, we thought we were paying more than our pro-rata of the State and County tax. There were mass meetings in the city, the leading citizens and tax payers of the city held from time to time, and it ultimately resulted in a committee being appointed out among the tax payers, and a committee from the county, to work jointly and recommend something to the city—to the Council. They come in and recommended that there be a committee of three, whose judgment they thought ought to be good, in regard to values in the city, and they appointed the committee that done the work; that is about the way the thing come about.

Q. Now, that committee did not as a matter of fact attempt to arrive at true cash values?

A. No, we never pretended to.

Q. Did I understand you to say that, with reference to industries within the city, like the L. S. & I. R., the Pioneer Iron Company, the Lake Shore Iron Works and the S. S. & A. R. C. you did not even attempt to place their property upon the roll that you prepared at 80% of its true value?

A. No sir, we did not.

Q. In other words, it was the opinion—state whether or not it was the opinion of your committee, that those industries should be favored in taxation?

552 A. Yes sir, and we made that recommendation in making our report so that the Board of Review would know what we had done, and it was subject to their approval, if they thought it was all right.

The Master: Did you state that in connection with the certificate, did you put on your report that you had placed the property at its cash value?

A. I don't know whether it is stated in writing, but I was there when our report was presented to the Council.

The Master: How do you reconcile that with the certificate that you put on your report, that you have placed everything at its true cash value?

A. Well, I don't think our report is the true cash value, it was not the intention, anyway.

Mr. Butler: Was it explained orally?

A. It was explained orally in council meeting, the best of our judgment, and, in putting on those enterprises at a lower value *that* the rest, it was the best of our judgment subject to the approval of the Board of Supervisors.

Q. The exact statement that you made was, that we have inspected all the property, and placed a fair cash value on the same, to the best of our knowledge?

A. That is right.

Q. It was not your intention to value any property, and you didn't value any property, that you knew was used for railroad purposes?

A. No sir, it was not our intention.

553 Where property was vacant and producing no income, we did not in all cases keep our valuation up to 80% of true cash value; to make value takes a buyer and seller. In many places, we did not put what was offered for the property, or near 50% of what was offered, because we considered it unfair and unjust on some property that was non-producing. A geographical glance would tell that the Longyear property was not of the same value as the South Shore water front of 2,200 feet, there cannot be either egress or ingress; a part of it is rocky underneath, a short distance from the shore, and, in fact some part of it is rocky right to the shore; you cannot get to the shore. They would have to cut out South Shore dock No. 4, to get much benefit for dockage purposes. A part of Longyear property, out near the breakage, is valuable for water front purposes. You would have to build a dock out to it. The old lumber dock is the only part I know that is valuable—200 or 300 feet of it. You could only get in at one place—150 feet of it—with a railroad, as the hill is quite abrupt; it is not so easy of access as the South Shore property.

O'Meara lot is the only vacant property on Washington St., Front to Third, average value of frontage of vacant land here is $250 per foot—somewhere along there; it takes a buyer and seller to make a commercial value.

554 ROBERTSON.

Recross-examination.

By Mr. Wykes:

When the committee for valuation of property in Marquette was provided for it was understood that the State Tax Commission was going to put Upper Peninsula values on at cash value.

We were going over our city anyway, and thought we would get it up a little higher; we didn't figure the Tax Commission would put on values too high; we thought we would put it on pretty close to value. The committee was provided for by council resolution and compensation bills presented to council. We did not intend to dis-

criminate between vacant and improved property; we acted among ourselves, as buyer and seller—if a man wanted to sell or buy, or it had to be sold under hammer, what it would bring, and kept a little under that. We figured that would bring it 10% under cash value, or something to that effect; property under the hammer is sometimes sacrificed. Front St. property would not go at much of a sacrifice, if so sold. Forced sale is not my idea of cash value. We fixed our determination that commercial value is created by a buyer and seller; with no purchaser the whole city is worth little. With South Shore tracks east of Front St. moved and its water front thrown on market, I don't know if it would be worth more or less than now; owing to the size of the town, and the ore fields within 15 miles, I think it worth just as much with tracks and South Shore removed; it would be in demand for some purpose as used
555 for today. I know of no demand outside of railroad purposes.

I know of no other use this water front property could be put to, than for ore dock purposes; that is the commodity we have. The question of what it was to be used for didn't come up in fixing my values. We have more ore dockage in use now for other purposes than is needed; I don't know any other use for Longyear property than for ore docks,—I testified that it couldn't be used for that. I put a value on South Shore 2,200 feet water front for ore dock and other purposes; I know of no present use of Marquette water front, save by Standard Oil Company, and those who hold under South Shore railroad Co.

556 On November 8, 1912.

CHARLES F. LOWETH, a witness called by Plaintiff.

Direct examination.

By Mr. Butler:

I am Chief Engineer of the C. M. & St. P. R., and Consulting Engineer for the Chicago, Milwaukee & Puget Sound and the Tacoma Eastern Railways, approximating 9,500 miles. I have been connected with railroad engineering since 20 years old, and engaged in construction work of all kinds at various times in many parts of the country from 1880 to 1901. Since 1901 have been continuously in employ of C. M. & St. P., being Engineer and Superintendent of Bridges and Buildings, 1901 to 1911; since then Chief Engineer.

I have given attention to the cost of reproduction of existing railroads:

(*a*) Since 1903 or 1904, to make the C. M. & St. P. returns to Wisconsin, Minnesota and South Dakota; for those returns I had charge of computation of values of the property in my department, including bridges, buildings, structures, water supply, etc.

(*b*) For last two years, have made an approximation of values of certain of our property in Minnesota, and our terminal property in Milwaukee, Chicago and elsewhere, and at present my department is valuing this company's properties in Illinois and Iowa; this work

has been under way nearly a year and is approaching completion.

I have had much to do with acquiring right of way for C. M. & St. P. and have become familiar with prices paid and their relation to the value of the same and like lands for other purposes.

557 In Michigan Upper Peninsula, the St. Paul has approximately 100 miles of line. We are now building 25 miles, Crystal Falls to Iron River; excluding small spurs, I have had charge of building no other line in Northern Peninsula.

I am able to form an opinion of relation between cost per acre of right of way lands in rural districts, Upper Peninsula, to value of lands through which right of way extends; it ranges from possibly two to five times as much. The average in Michigan, along South Shore, of cost for rural right of way purposes would be not less than three times the value of land for other purposes. In cities and towns such as on South Shore cost of right of way and terminal lands would be from one and one-half to three times higher than market value of same or similar lands for other purposes.

These opinions are based on my experience as a railroad man. On 25 miles being constructed in Michigan the question of mineral rights in our right of way becomes involved; Crystal Falls to Iron River, there is much mining, there being mines in operation and prospective mines, and much land supposed to be underlaid with ore. We have been obliged to take right of way subject to mineral rights; over practically the entire length of branch, we have nothing but surface rights, it being, in many cases, subject to right of owner to compel us to move our track, if necessary, to get at the ore; it is a revocable easement.

558 The line, Crystal Falls to Iron River, is through a territory subject to caving when surface is mined under. We protect ourselves by hauling in earth and maintaining track men there the entire year, to keep the track up; the settlement is gradual and slow, and covers about a quarter of a mile of the track. To my best memory, it has cost $5,000 to $15,000 to keep our track up for several years past, over that quarter mile space.

For South Shore earth work constructed in 1911 or 1912, the cost would, in my opinion, be 30¢, or probably more. On our 25 miles being built in Michigan, this work was divided into two sections, approximately 11 and 12 miles long; on one section, clearing bids ranged from $45 to $80, and on another from $45 to $96, per acre; the contractor securing the work was the lowest aggregate bidder, but highest for these items.

There were 14 bid prices for first section of 11 and 12 miles, with 136,000 yards. Low bid and contract let, $157,875; high bid $218,410.

560 The overhaul was bid for separately on first section, and prices ran from 1¢ to 1.5¢ per yard; the bids were on the basis of the company transporting, over its own line, all men, tools and equipment, free.

To make estimate of cost of reproduction everything done should be included. On work done after contractor is through, I would limit the charge to construction to things of construction delayed to be done after line is completed; certain things can be done more cheaply when road is in operation. My remembrance of the specifications are that the loose rock classification would take the hard pan.

In constructing South Shore all at once, including entire railroad, I would expect the prices to average much higher, as a large amount of work devided between a given number of contractors leads them to believe there is going to be plenty of work in their line, and if they were not successful in getting work at the first letting, they were going to get it at some subsequent letting. On the 25 miles, contractors were anxious to get the work, and I have no doubt they made very low bids; if it were 25 out of 600 miles of line, the different sections would probably command higher prices. If a large amount of work is to be done in a state, the demand for labor will exceed the supply, and labor will have to be brought from a long distance, and it would command a higher price and cost more to look out for the labor and bring it in; all the supplies would also command higher prices. The ten-
561 dency would be to higher prices if the whole 600 miles of track were let at once.

My opinion of the fair cost of track laying on South Shore, if reconstructed, would be $800 a mile. My analysis of cost, from study in Iowa and Illinois, is: Train service, $235.45; track laying machine, $28; camp equipment, $11.50; superintendence, $10.50; machine gang, $22.50; rear gang, $51; front gang, $53; surfacing and lining, $115.50; loading at material yard, $1.29; camp outfit, $10; use of tools, $8; maintenance of track during construction, $98.50; and transportation of laborers, $30; aggregate, $803.

The item of contingencies in the cost of reproduction of a given property, should include those items of cost, whatever their character, that could not be seen in making an inventory of the property or which might be overlooked or by error or oversight omitted from such inventory and by the possible error in the unit cost that might be taken in making the valuation. The contingencies in making an estimate of the cost of a property to be built would cover those things which, due to the haste in which the matter was investigated, had been overlooked or which from the nature of the case could not be foreseen and provided for. I think that there is very little, if any, difference in the allowance for contingencies in the case of making an estimate of reproduction of an existing property and in making an estimate of the cost of property that was proposed to be built, for the reason that as we go over a completed property there are always some elements of cost that are not apparent. It is impossible to carry out any large piece of construction without accidents, accidents of such a

nature that they involve loss of life and property. Those losses enter in as one of the contingent items. In going over a completed
561a property it is impossible to tell whether anything of that kind did happen or not, but from our experience in reconstruction we know that they certainly do happen. When we built our line to the Pacific coast our company spent between $250,000 and $300,000 to make trails and final roads across the Bitter Root mountains. We needed them to get over the country in order to make our surveys and to get out contractors over it and to get the contractors' materials in. There is no evidence of that item of expense today except that the roads are there and belong to the public. It was a contingent item in the cost of that construction. The item of contingencies arising from the necessity of changing the routing of material forwarded to near points from that planned, anything of that sort, almost invariably comes in and sometimes in very large amounts in any large construction. Another instance in the construction of our line to the coast was that we had anticipated taking all of our track and bridge material out over our own line and carrying the completion of the line out from the Missouri River through to Butte, Montana, and we worked on that plan until we got pretty well into the State of Montana, and due to difficulties which were unsurmountable, we had delays in our grading so that it was apparent that we would suffer a very serious delay in the completion of our line through to Butte unless we sent our material around by the N. P. road to Lombard and begun laying the track easterly from Lombard. That involved the paying of revenue freight on material for long distances, that was not a part of our plan. We are doing at the present time a large amount of new construction work involving 200 miles, more or less, of double tracking and new line construction in Iowa and a similar amount in Minnesota and South Dakota. We have been unable to get waterways completed, that is, bridges in and culverts in, so that in many cases the grading contractors have been obliged to leave openings in the embankments for these incompleted waterways or else to pile the material up at each side of the opening so that it could be put in
561b after the opening was in. That will involve either one of two things, the handling of a large amount of material a second time or the leaving of the openings and temporarily bridging them and the handling and filling them later. In many cases we have put in a construction for waterway which was not the most economical, because of the urgency in getting that particular job done. It sometimes involves a change of plans from the original purpose. There are unexpected difficulties that come up and we find that it is necessary to stop and back up and start again and that means the abandonment sometimes of work actually done. The contingencies in new construction of that kind are oftentimes very large and they are more than is usually the case in building construction or in any kind of construction where the work is concentrated, such as it is in a large bridge, where the conditions can be readly seen. The building of a railroad extends over a great many miles of country and sometimes it is difficult of access and the natural conditions are very variable and it is impossible, practically speaking, to anticipate all of the difficulties

and so it is customary to add a considerable percentage for contingencies and after the road is built and an estimate is made of what it would cost to replace it, there are a great many things that legitimately and properly enter into the cost of the road that cannot be discovered. Open cuts are sometimes found where it was originally intended to build a tunnel or perhaps a tunnel was originally built. We had a case of that kind near Rosalia, Washington. A tunnel was built through a spur of the hill, I don't remember how long it was, but six or seven hundred feet, as nearly as I can recollect, and before the line was put on a construction basis we found that the material was yielding, before it was put on an operation basis, and notwithstanding that it was a well timbered tunnel, we had to make an open cut of it. The cost of doing that was considerable, because the time that it took to do it extended past the period at which the line had been
561c opened up for traffic, and that enchanced the cost of doing the work. Another contingent item is that work of this character is subject to floods and fire. We are necessarily obliged to build across valleys and along streams. The time required for construction involves mony months, sometimes two or more seasons and floods occur and the work that is partly done is washed away and it has to be replaced. That cannot be guarded against. It is a contingent item. Our company had notable experience of that kind. We had our line approaching completion and some considerable track was laid between Deer Lodge, Montana and Missoula, right side by side with the Northern Pacific. They were building at the same time and there was an unprecedented flood and the loss to our company from that flood aggregated something in excess of $600,000. It covered a matter of 75 miles or more, and about that same season we had on the other side of the Rock Mountains in the Jefferson River and in the Musselshell River, a number of bridges in which we had put in the piers and the steel work had been delayed and we were carrying our construction trains over on false work and a flood came and so much drift collected in front of the structures that the stream was blocked and our permanent piers and false work was more or less washed out and we had to replace it and in addition to the cost of replacing it was the delay to the work. Another contingent item was where a great many timber structures that were built and subsequently replaced by embankment, the intention was to make the embankments from the outset but there was no material available within reasonable distance by haul by contractors' outfit and it was necessary to put in timber structures to take care of our construction train service, and fill by earth by train haul. The inspection of the completed property after the lapse of some years would not disclose the original expenditures for the trestles. Another contingent item is classification for material. There are many kinds of material which at the time that they are opened up would properly be classified as loose rock or
561d hardpan and yet after the surface is exposed to weather they resemble common earth and in going over a road and looking at the surface or slopes of the cuts one would say confidently that that excavation was made in earth whereas by going into it more thoroughly you would find that it was hard-pan or a considerable portion

of it was hard-pan. Another contingent item is the diversion of highways and private roads and waterways for one reason or another It is necessary oftentimes to divert these, the cost of which involves extra right of way, extra grading, oftentimes the moving of buiidings and structures of various kinds. After the work is completed, especially after the lapse of a few months or years, there is no evidence of the diversion of highways, farm roads, no evidence oftentimes of the diversion of streams. A great many contingent items come in from unanticipated or unforeseen expenditures due to delay in transportation of material or equipment or men. In the buiiding of a railroad there are large amounts of material to be purchased and gotten in hand and it is necessary that they should be gotten in hand in their proper order. Track cannot be laid if we have an abundance of ties and have no rail or if we have the rail and have not got the fastenings. Track cannot be laid unless we have the material in hand for the bridges and the culverts. If the material is not there, then either the track laying is deferred and the force of men and equipment stands idle or an expedient is resorted to which costs in many cases a great deal of money. It is of almost daily occurrence that a contingency arises in which you cannot stop to count the cost. It must be met and overcome no matter what it costs and if the material is not on hand for a bridge the ties will be taken and they will be cribbed up, and the track carried over that way. Then after the track is over and the material does come, why those ties, track, will be taken out and the bridges put in. That is only one of thousands of instances of that kind, all of which add to the cost of the construction. They
561e cannot be avoided, or foreseen. They can be foreseen to this extent that we know that they will come in all large construction and likely to be met with but I say confidently that one who has not been right on the ground and seen and had experience with these conditions, can hardly realize the frequency with which they occur and the pressure that is brought to bear oftentimes to overcome them irrespective of what the cost may be. When we started to build our Puget Sound line, one of the first things that we had to do was to cross the Missouri River and we had to get our material across, not only our material, but all the contractors' supplies. We were in a country where there wasn't anything, you might say, and we had to build a temporary bridge over the Missouri River and our construction account shows that after we credited up as much of that temporary construction to the construction of the permanent bridge as was reasonable and proper, that we spent in excess of $70,000, simply for facility to get a track across the Missouri River, that never would show up in any inventory that might be made of that piece of property today. The building of that bridge involved several contingencies. The river is subject to rather rapid rises. It has a very strong current and we had an unexpected break-up in the spring, and we lost a partly completed caisson. It was swept away from its moorings, taken down stream two or three miles, and the cost of recovering it was more than it was worth and it was abandoned. We had several fatal accidents. The cost of that bridge alone was slightly over $1,000,000, and we had, I think, two or three fatal accidents. In my judgment it would

be conservative to put a contingent item of ten per cent on the entire cost in making an estimate of the fair reproduction cost of the Duluth, South Shore and Atlantic road in the Northern Peninsula of Michigan. While the contingent amount on some items might not be as much as 10 per cent on others it might very readily be much in excess. That would not include 10 per cent on the cost of or-
561*f* ganization and legal expenses and interest during construction and engineering and the like, but upon the physical items, the cost other than the overhead items. In my opinion the 10 per cent would be the average of all items and not the amount of contingencies applicable to each item. I think it is universal in making an estimate for new work, to allow for contingencies, add a percentage that cannot be defined, and it has been our practice to add 10 per cent, and to add 10 per cent after we had taken unit prices that in a measure made some allowance for the same. What is done will depend largely upon the thoroughness with which the estimate is made. The contingencies are variable, and you might build a hundred miles of railroad this year and have certain kind of contingent items and rebuild a piece of line side by side and of identically the same character another year and the contingent items be different. Contingent items depend upon the weather, upon labor conditions, and then again the contingent items, take for a hundred miles of railroad in one state, might be of a certain character and in another state they might be of still a different character. It is the unexpected that is covered by the contingent items. Contingencies would be a greater average on some classes of work than on others. For myself, I have gotten at the average by my experience and my observation. Sometimes the contingencies may not be as much as is estimated. At other times they may be much in excess, and an estimate of a certain percentage for contingencies I think from the very nature of the case, must be an estimate, and cannot be arrived at with any exactness.

I am as confident, as I could be of anything that has not occurred, that in the reconstruction of the South Shore road, we would have casualties, accidents, which would involve injury to persons and property, which would be contingent items such as those I have mentioned, for work of that character, which would extend
561*g* through three or more seasons. It is also quite sure that there would be contingent items in the way of floods. There would be contingent items in respect to classification. I doubt not that there is considerable material, the exact character of which would not be evident on a superficial inspection of the property. I do not see how that extent of railroad could be built without involving diversions in the highways, in farm crossings, and in diversions of streams. Those contingent items would surely occur. There would be contingent items in connection with the construction of the road over or under or across other railroads, electric and steam; due to the crossing of telephone and telegraph wires which would have to be changed; due to the construction in the cities in which paving would be disturbed, water works pipe or sewer or things of that kind. There would be other contingent items, that would be more or less of the general character of those I mentioned. In my judgment there is a reasonable prob-

ability that these or a certain proportion of them will occur in every railroad that is constructed. The percentage would vary according to weather conditions, season of the year and character of the country through which the road was built. The contingent items would be smaller if all conditions were favorable, such as casualties, floods and things of that character. The items of farm crossings, highway crossings, of pavements in cities assume the passing through of a settled territory. If the territory is sparsely settled, the possibility of those items and the amount and percentage for them would be smaller, and for exactly the same reason, other contingent items would be more. There is, as I remember, the country, a large proportion of swamp land and soft land, the surface of which is soft and yielding, and there would be a more than usual contingent item in the increase of earth work on that account. The country traversed by the South Shore railroad is not as accessible for the getting of supplies and men as a similar length of railroad would be in many other sections of the country, and the difficulties of getting
562 labor and holding labor and getting supplies in, would be enhanced over and above what it would be in most any other section of the country, anywhere within a radius of 500 miles, or a thousand miles. Where the work is contract work, the contractor would bear the cost of casualties and they would enter into his price. If he was financially able to carry out his contract, he would bear that burden, but contractors are not always able to do that, and when they fail, the railroad company has a contingent item that often varies considerably. I think the conditions might possible be as favorable or as unfavorable that the contingent items might be as little as 5 per cent and possibly as great as 15 per cent.

In rebuilding South Shore, legal expenses would certainly be incurred. We could not build a considerable piece of railroad without becoming involved with other railroads and corporations; there would be negotiations and contracts to be made with other railroads and corporations, rights to be acquired in cities and towns, ordinances permitting construction, the crossing of streets, etc. There would be demands from one source and another and claims
563 arising. There are highways to be changed, making necessary contracts with municipalities. In our line, Crystal Falls to Iron River, legal expenses are unusually large, because of difficulty of getting right of way involving mineral rights. So far we have assumed, on other overhead items, .5% for legal expenses, and I have not gone into it with enough detail to know whether I care to change that; it is probably conservative.

In estimates of cost of reproduction of parcels of railroad property, the item of organization, administration and general expenses is usual. While I have not analyzed that in detail, it is usually assumed at 2%, and I think fairly so. That is customary with engineers in work to be done and in appraisals of existing property.

The item of engineering is also usual; allowance of 5% on entire cost, except overhead charges, would be fair and reasonable. That is an average; engineering on equipment would not be that high, but the average of 5% is fair and reasonable.

The item of interest during construction is also usual, and is arrived at by taking a fair rate of interest for the period covered by the average amount of investment, and taking into consideration that loss of interest extends to and even beyond completion of the work. It extends until the property is turned over to the operating department.

To secure right of way and construct South Shore in an expeditious manner, having due regard for economy, and taking into
564 account lack of facilities for access to the property, shortness of the seasons, and extent of the work, it would take more than three or four years to complete; if it took three years, the entire expenditure would average an interest period of 1.5 years, or, if four years, an interest period of two years.

As bonds of established railroads can be bought to net 6% or more, I do not see how South Shore could get the money for less than 6%, and it might have to pay more; this rate is conservative, interest on three year basis would be 9% and on four year basis, 12%.

LOWETH.

Cross-examination.

By Mr. Wykes:

We began construction of 25 miles in Upper Peninsula last spring, and I don't see how we can turn the property over for operation until next fall. Section 1 is 11 miles out of Crystal Falls; section 2 is the balance, to Iron River.

In reconstruction of South Shore, I am as sure as I can be of anything that has not occurred, that we would have casualties, accidents involving injury to persons and property, and contingencies for floods; I don't doubt there is considerable material, the exact character of which is not evident on superficial inspection. I don't see how that length of railway could be built without diversions in highways, streams and farm crossings. There would be contingency items connected with construction of the road over and across
565 other railroads, and crossing telephone and telegraph lines. In cities, both waterworks and sewers would have to be disturbed, and there would be other contingency items, more or less of the general character of those mentioned. There is such reasonable probability of these that a certain proportion will occur in every railroad that is constructed; they will vary with the conditions of weather, the season and the character of the country. If all conditions were favorable the contingency item would be smaller. The items of farm and highway crossings and pavements in cities assume the passing through a settled territory; if territury was sparsely settled, their possibility and the percentage for them would be smaller, and other contingency items would be more *that* the usual contingency item, in increase of earth work on that account; the inaccessability for supplies and men, difficulties of getting and hold-

ing labor and getting supplies, would be enhanced a' ove what it would be in any other section within a radius of 500 or 1,000 miles.

In casualties, where work is done on contract, those that occurred on contractor's work would enter into his prices and he would bear them.

If contractor on our 25 miles in Upper Peninsula injures someone, his 25.5¢ for grading must bear that, if financially able. If they fail, the railway company has a contingency item there that is often considerable. Under favorable conditions, the contingency item might be as little as 5%, and it might be 15%. From the
566 nature of the case, the contingent item cannot be stated with certainty.

There are many items that might be treated as items of contingency that subsequent inspection for appraisal will develop—that there was an expenditure on account of something that could not be foreseen when the road was planned and contract let. If sufficient time is taken and expense incurred to make survey of the property, and all factors were carefully investigated, the element of contingencies would naturally be reduced, but that is rarely done. The degree of thoroughness with which such an investigation is made will govern, largely, the extent of contingencies.

Q. The purpose of my question was not to indicate that you must go and take the measurements, but that the contingent item on a road like the South Shore, parts of it of comparatively recent construction, instead of going off into Iowa and Illinois and other states to furnish hypothetical cases of what might have come in by way of contingencies, the facts as to what contingencies actually occurred on this road can be pointed out, and so I wish to base on that this question: Assuming that a large part of the South Shore line was constructed as late as 1887 and after that, and people who were with the road when it was constructed are still alive, wouldn't a nearer approximation of correctness be arrived at by calling those people as witnesses as to what contingent items actually occurred *that* it would to speculate on them?

567 A. That would in a measure determine the contingencies, yes sir. But I contend that in a piece of construction through the northern Peninsula and identical with the D. S. S. & A. couldn't be inventoried today and get all of the items or elements that entered into its cost. It seems to me impossible to do it. Conditions change, and you cannot tell when you look at an embankment how much is under the surface of the ground, on either side, unless you go to a very large expense and make tests and excavations to determine that.

In any event, a percentage is necessary, and 10% expresses my judgment of one sufficiently high to meet the average conditions.

So far as I know the experience of the engineering profession, those things are to be expected and necessary to be provided for in one way or another. I might have enumerated many other contingency items, many of which would almost surely happen in Northern Michigan.

In our valuation work, we apply prices for labor and material as of 1911, the longer period being better than a more definite date.

For work done within last two years, we had records of original cost, and took them as a criterion of prices assumed for valuation, in order that we could check up our assumptions for last year's prices with what similar material had or would cost under similar conditions.

I have not been over the South Shore for a couple of years; at various times I have been over parts of it, and I think at one time and another over all of it—some parts very frequently. I
568 was connected with the construction of Soo Line, Soo Sault Marie to St. Paul, and part of my knowledge of South Shore conditions is based on knowledge of Soo Line. I was Consulting Engineer of Soo Line when built, and for several years after.

I accounted for variation from 72¢ to $1.50 on solid rock, on our 25 miles, as there were 14 bidders; some were more anxious to keep their plant and equipment busy than others; some may have had work dragging over into this season, and were not anxious to take more without a very good price; contractors at beginning of season attempt to forecast the amount of work likely to come up and the necessity for them to make high or low bids to keep busy. Then there is the personal equation of the difficulty of estimating cost of work.

I don't think solid rock could be moved for 72¢ without loss, and the variation between 72¢ and $1.50 was the difference in judgment of men willing to do the work. There is necessarily a variation in judgment of engineers as to cost of doing a particular item of work; while the 25% difference between two engineers would be a strange case, estimates might vary as much as that. There is no possibility of that difference in estimates fairly made by competent men; there might be, possibly, a variation of 10%; while there are very large variations in the bids for any one of these particulars, the aggregate of the bid, taking all of the work into account, is less than the variation in the bids for any one item.

569 Q. Haven't you noticed that in the source you take for your price there is a variation of 10% or 20%; perhaps at times you might look to one source and find one price and to another source and find an entirely different price, and they would vary say 20%?

A. That is frequently the case; not always the case.

Q. I don't mean that it is always the case, and couldn't a competent engineer honestly take either one of those sources, perhaps?

A. Well no, he would have no right to take the lowest bid.

On 600 miles of road, the competition would be restricted to a fewer number of contractors than the 14 who bid on 25 miles. I don't think we would get competent, experienced, financially reliable contractors equal to half this number. It would be let in a single contract on the idea of sub-contracting; that is general practice. The advantage of this is to have men of ample means and financial responsibility to stand between you and the financial loss that may occur in dealing with small contractors.

In building up shoulders, digging out cuts, putting in side channels, etc., after work of construction is complete, the practice is to

follow I. C. C. rules, charging to maintenance all expenditures for keeping original standard of roadbed. Anything improving standard is a proper charge to additions and betterments. In cases where original construction is incomplete, it is proper to charge to
570 additions and betterments work which it was necessary to complete.

If a bank was widened after completion, the charge would be to additions and betterments, while, if original banks were swept away by a flood the charge of replacing would be to maintenance. In a contract for grading 219 miles from Missouri River, in South Dakota to Black Hills, overhaul on earth work amounted to 7.5%. In a part of the work in Missouri the contract price for filling bridges was 27¢ but the overhaul brought the cost to 50¢ a yard.

That would not be comparable with a line where they were making a grade, but it has a bearing, as every railroad has to fill in earthwork after contractor has gone ahead, leaving temporary bridges. Certain places are frequently found where the bank of earth is a long one, and a temporary trestle or bridge is made to carry the traffic for a while, and afterwards it is filled in at heavier cost than contract price.

The amount of subsequent filling depends on the country—if the ground it firm, little filling is required, if there are swamps and marshes, more is necessary. The 219 miles I spoke of would not compare with South Shore, as that was a cheap line, with narrow banks and shallow cuts.

The South Shore overhaul would probably be much more than 7.5%, whether paid to contractor or done later by railroad, as there are many swamps and marshes to which earth would be hauled from long distances.

571 I have made no calculation with reference to South Shore.

In fixing a price of 30 cents, I considered the item of overhaul. The contract price was 23¢ on the first 11 miles, and 27¢ on the balance. The overhaul on the first 11 miles was estimated at $3,660. The estimate on the last part was not complete, as we had not finished our profiles for the farther end of the work, nor some spurs and branches. Those parts not surveyed were called to the attention of the contractors when they made their bids. The overhaul was one of the considerations inducing me to raise average prices to 30¢. The shrinkage was not considered for that would be included in estimate of quantities.

There has been a decided increase in the price of grading and labor. Last year, we paid $1.75 a ten hour day for labor. This year, we have paid $2 to $2.25. Labor today is higher than 10 years ago, but I don't think it is higher now than average for last 10 years.

A railroad is, in many cases, worth more than the cost of replacing it, as where it has a large and profitable business. For rate fixing purposes, an investor is entitled to a fair return on his investment, as it is not his fault if the business is not there. The investor is entitled to the same appreciation in the investment that could be fairly gotten in any other fair field of activity. Measuring value of

this road by reproduction cost, it would have been worth one price in
1906, when wages were very high, a lower price from 1907 to
572 1911, other things being equal, and a higher price this year,
when labor is again high. The fluctuations are generally balanced by changes in other conditions, so the total value is not greatly affected.

The general trend of prices of material and labor has been upward for more than ten years, but it is possible that the difficulties in reaching the country, and the poor construction facilities, would fully offset cheapness of labor and material years ago, so that the cost at that time would be as much as or more than, now. I think that is a general rule with railroad buildings.

Some items of expense, as labor and material, would be much heavier today than when our road was built, but rails cost less today. Real estate is also much higher, because the road developes the country.

There is no question but that in the majority of cases the cost of reproduction new, today, would exceed original cost. This is due to the higher cost of wages and material and because every railroad must make constant improvements, which are charged to additions and betterments. When I make that statement, I have in mind original cost of everything today, as compared with reproduction cost figured as an appraisal. The general advance in prices is a serious problem which raliroads have to face.

The 30¢ I have figured for grading takes into account the fact
that throwing on the market 600 miles of such work would
573 cause an increase in price, of 5%. If the work was done in
sections, not all at once, this element would be reduced, but not as much, as the cost of reorganization is heavier; the labor supply is limited, and must all come from the south. I have built two ore docks at North Escanaba, since being with St. Paul. The first was enlarged after I got there, taking one season. It took two seasons to build the second one. It was possible to use the part finished at the end of first season; I don't know as we did.

The 12 miles of double track, Marquette to Ishpeming and Negaunee, and ore docks could be built within a year, provided plans were made to work at proper seasons. Plans would have to be completed in early summer, so work could be pushed entire eight months of open season; otherwise it could not be finished in one year.

On 200 mile Iowa contract, grading prices range from 20¢ to 29¢. The work was done in sections, the past year. The longest section was 20 miles. I have some of the data on those sections. In those contracts, the construction was along our presently operated line, and all material, machinery, labor, etc., was hauled to the camps by the company, without charge to the contractor. Spurs were built off main tracks, and tools and equipment delivered without charge. The cost of their delivery was heavy, but there are so many intersecting lines in Iowa that, had we not done this for contractor, he would not have had to haul his supplies far. In our Puget Sound
line, contractors had to take their supplies and shovels many
574 miles across country. The prices always vary depending on
cost.

Competent engineers might vary on track laying and surfacing, depending on their acquaintance with the work, or by the amount of observation. It is a complicated question to figure cost of those items, as many things enter which can be easily overlooked.

I would not expect two competent engineers, both honest, to come within 10% of each other on these items, unless both had been through an experience of track laying, recently, and had taken care to examine the question thoroughly. Even then, one may give a different weight to the same considerations than the other does. I used the best judgment I had in fixing my estimate, and I am not surprised that Riggs and I differ $270 per mile. Other engineers have made it even lower than Riggs. This same uncertainty enters into other items of railway construction, and other engineers, whom I believe equally competent and honest, and who have had considerable experience, have fixed prices in some cases much lower and in some cases higher than Riggs and I have fixed.

I went into it with much care, and was surprised at some of the items that I found entered into the cost of construction. A more careful analysis might produce more. If Riggs valued the Marquette car shop at $20,000 at practically the same time, in 1911, that it was built at a cost of $16,000, that is too much variation.

575 No general rule can be infallible when applied to specific instances.

In the application of the I. C. C. rules, the judgment of the engineer or auditor is exercised as to what account the charge is to be made to. Sometimes it is close to the line, and a consultation has to be held.

If Riggs valued engine number 37 at $3,366, and it sold in the same year for $1,600, I should consider that an unreasonable discrepancy. The value should be gotten at with less difference than that. The trend of locomotive prices has been up for 10 years, as has the price of freight and passenger cars.

I stated 26.5% to be the aggregate for overhead charges, beginning with contingencies, including interest during construction at 9%, and ending with legal expenses. There have been appraisals which fixed this lower, and some, I think, as high.

In reports to railway commissioners of Wisconsin, South Dakota and Minnesota, which I furnished for our roads, I used lower overhead charges than I have stated here, because it was a new matter then and we made mistakes. We reported engineering charge 4.5% in Wisconsin; 5% would be conservative.

There would be one to two years of taxes on the incomplete road not included in this valuation. The figures I reported in the other states for overhead charges might be one half less than those I have given here.

576 But in Minnesota the report has gone through a process of evolution—at first it was made hurriedly, without a thorough examination; as more information was asked for, we have gone into it more carefully, and found omissions from former reports. At first we didn't know whether our report was to be used for taxation or rate making, and at all times we tried to make an honest

valuation. There has been little, if any, controversy between us and the Commission.

Engineers should not vary as much as the difference between $60 and $35 for bridge timbers in place. I have no doubt that on individual items there may be a greater variation than 10% between Riggs and myself; such a difference does not reflect on either of *is*. A difference of 25% may exist between engineers, both competent and honest; there should not be this much difference on the entire work. The amount of difference depends on the degree of investigation and reliability of data. I believe my information is full, and data accurate.

An example of obsolescence in bridges is a frequent necessity for replacing bridges intended for light traffic. Some bridges cost less to maintain than others, and this is the reason for replacement of many. I don't see how you could take into consideration the fact that the company intended to replace it next year, when you were fixing its value. A bridge is a composite structure, and may be continued in service indefinitely, by replacing parts that give out. In many cases, it is wise to replace the entire structure with a better one, ever
though it could be made to last longer.

577 If, at the date this valuation was made, South Shore intended to replace 73 of their bridges at once, the life of those bridges should be figured up to the actual date of replacement. I have in mind a bridge on the St. Paul which we started to replace with a fill three years ago, but, because of wet soil, we have had to repair it and let it stand. You cannot tell how long it will take to finish the replacement of a bridge. In valuing the bridge mentioned, I should have taken as its life the period to which it could have been made to carry the traffic with reasonable repairs, rather than the period to which it was reasonably indicated it would carry it. Ballast depreciates slightly, and either has to be replaced with new or there will be an increase in the cost of maintaining the tracks. There comes a time, after new ballast is put in, when it becomes worthless as ballast, or involves a slight increase in the cost of track upkeep. Whether or not it is worthless depends on whether the road can afford to buy new ballast. The old answers the purpose, but, in good railroad management, it should be replaced with new.

Ballast gradually goes into roadbed and makes it more permanent, but there comes a time when the roadbed has appreciated to its maximum because ballast is driven down into the earth and forms a hardened coating.

That coating reaches its maximum value for all time, and does not increase the solidity of the roadbed after a certain period. That
period is reached in 10 or 12 years, or less if the traffic is
578 dense. But, even then, new ballast must be put on. In three
years after ballast is put on, it may depreciate 25%, depending on traffic and standard of roadbed required. New ballast is put in because it is generally cheaper to put in new than to screen or clean the old ballast with ballast forks, as is sometimes done.

It requires heavy expense to clean ballast. That ballast gets mixed

with dirt is the reason for its depreciation; that is the function of the ballast.

Expense of maintenance is due, in a measure, to both train movement and action of elements. The relative effect of either depends on amount of traffic—the effect of weather on the roadbed where traffic is light is relatively greater. Climate also makes a difference; but, regardless of climate, a large percentage of cost of maintenance of way and structures is due to the elements. In many cases the action of elements causes more damages than traffic.

Contractors' bids furnish good evidence of value of work, but you must remember that where the bids are competitive, the price is forced down. Bids should represent range of value, if made by experienced men, without collusion. It would not be fair to take the bid on a certain part of the work, but it should be taken on the whole, as some contractors have special facilities for doing certain portions. In arriving at a fair price from bids, you should average those close to each other, and eliminate those abnormally high or low.

579 Taking the 14 bids for removal of rock ranging from 72¢ to $1.50, I should start at the lowest and average on half or three fourths of them, leaving out the highest. That's a fair method, and should represent fair value of the work. You could average bids which were regularly graduated in this way also, but, in each case, I should use my own knowledge of the work and my judgment as an engineer. Each man's judgment has entered into his bid, but they vary from 25% to 100%.

In arriving at the price of 30¢ for grading, I took the price at which I let the bid and included my judgment of the overhaul, local conditions, etc.; a large factor in fixing the price was my own information and judgment.

Some engineers have considered 17¢ a fair price for some kinds of grading. I think each railroad would have to be considered separately, as much depends upon conditions, and, if this were done, each location on a railroad would have to be considered separately.

We can use steam shovels for about 25% of the 25 miles we are building in Michigan. Steam shovel work is more expensive, because it is possible to do work which otherwise would not be attempted. By the use of steam shovel, taking it per yard, the cost is less than by other method.

The prices I gave were for 1911; there was little variation that year. The prices would have been about the same for two year period (1910 and 1911).

Prices were generally higher in 1909, and have been higher in 1912. The bidding on this contract in the Upper Peninsula was in the spring of 1912. The prices are higher now.

580 LOWETH.

Redirect examination.

By Mr. Butler:

Referring again to the bids for moving the solid rock, they included clearing, grubbing and loose rock. You could not separate in that list of bids the range of prices for any one of the items and draw a fair conclusion, because certain bidders may have special facilities for doing parts of the contract. Each man bids with the entire work in mind, though on one part he may put a low and on another a high price. Bids cannot be forecasted, even where great care is used, as the contractor bids on his own figures and judgment. It is called an unbalanced bid, where there is great variation; engineers try to avoid such bids.

The roadbed appreciates substantially in value as an operating instrumentality if properly maintained for a period of years. Sinking of ballast down into soft places in roadbed like South Shore improves roadbed, and addition of new ballast brings it back to former standard, and makes it better than before.

It is a question of business policy whether a bridge in 60% condition, which can be maintained for an indefinite period by repairs and renewal, shall be taken out and replaced by a fill or better bridge.

The problem depends on traffic, financial power, policy of management, etc. Each instance must be decided for itself. Obsoles-ence may result from various causes. Even where rail was 100%
581 condition, it might have to be replaced because of heavier traffic.

An old road, well maintained, is worth more as an operating tool than a new one, and it cannot be said that a road is worth less than cost, if economically built and well located. It is worth more as time goes by and roadbed seasons, although part of the life of its parts has passed. The appreciated value relates principally to roadbed, but could include structures, buildings and bridges. The organization of the road and its management also becomes more proficient. The value of the "going concern" depends upon location, efficiency of organization and facility for handling business in each case.

A partial investigation has resulted in finding that it costs a cent a yard, of grading done, to transport contractor's equipment and men. The overhaul on our contract amounts to 12%, or 3¢ of the 26¢, which is the average price of both sections.

That contract consists of two sections, the length of one of which was known, the other not. The average is 26¢ now, which, added to 3¢ for overhaul and 1¢ for transportation, makes a total of 30¢.

I don't think the item of interest during construction should be lessened by earnings of road during that time on South Shore, because operation would interfere with construction, and make it cost more.

582 On our Puget Sound extension, we, of necessity, put on revenue trains before line was completed, because it meant the

building of permanent towns on the line resulting from heavy immigration that year. I don't see how we made any profit out of it, though I haven't the figures.

LOWETH.

Recross-examination.

By Mr. Wykes:

Ballast depreciates, to an extent. Part of the new ballast applied takes up depreciation of the old, and part improves the roadbed over the old standard.

Where it is a betterment, it should be so charged, and not to operating expenses.

My price of 30¢ included overhaul, and no overhaul should be added after the application of that price. I think I stated yesterday, that there would be some overhaul added to the 30¢ including overhaul, I referred to the price we paid in Iowa. When I fixed a price of 30¢ on South Shore, I did not intend to include overhaul. I did, however, intend that the contractor would do the work without free transportation of men and material, as we gave in Iowa. (Mr. Wykes: It stands in the record that you answered me twice that you did include overhaul in the 30¢, and also that you made that figure of a combination of 26¢ for grading, 3¢ for overhaul and 1¢ for transportation.) If it so stands, I ask that it be corrected to correspond with my present statement.

When I say a road cannot be operated profitably during construction, I do not mean that, if a part or section of it is thoroughly
583 completed and traffic is there, it cannot be operated profitably. That is the natural result of roads being constructed in sections. In such cases, operation should be profitable, and that part should be taken off the interest-bearing charge, and sustain itself.

584 (The parties admit that the 1911 value, as stated in Complt.'s Ex. 1, Riggs, is correct: Schedule 33, Miscellaneous Equipment, pages 279-280; schedule 20, Shop Machinery and tools (Mich. and Wis.), pages 213-219 and 317; and schedule 21, Roadway and Construction Tools (Mich. and Wis.), pages 220-225 and 317.)

585 On November 15, 1912.

ALBERT H. HOGELAND, a Witness called by Plaintiff.

Direct examination

By Mr. Butler:

I am 54 years old and live at St. Paul. I am a civil engineer, with 33 years' experience. I graduated from Lafayette College in 1877; have been continuously in railroad engineering work in Wisconsin,

Minnesota, Dakota, Idaho and Oregon. I am now Chief Engineer of Great Northern, which position I have held ten years.

I have been employed by that road 28 years, in which time the great majority of its mileage has been constructed. I have been engaged in estimating cost of reproducing new its existing railroad properties. I am not familiar with South Shore, except that I know its location. Our road has much mileage in Minnesota, in vicinity of iron ore deposits.

The proper unit price per yard for removal of earth varies with conditions, the cheapest being on level prairie, where fill is light, where earth is generally put into the roadbed from the sides by grading machines, which reduces cost. The higher cost is present in more rolling country and where earth is taken from cuts to fills. In swamps the cost is greater because of wet soil and tendency to settle.

The unit price on grading includes free haul for a certain distance, with an amount added for greater haul. Other things increasing cost are transportation of outfits, men and supplies,
586 ditching, channel changing, etc. I have investigated additional cost to a railroad over amount paid contractor.

We examined contracts and records of Great Northern lines built from 1894 to 1907, in Wisconsin, Minnesota, North Dakota, Montana, Idaho and Washington—total, 1,500 miles. Average grading price paid contractors per yard was 33.6¢; adding cost of transportation and extras charged against grading, the average cost per yard was 44.1¢ showing a difference of 10.5¢ per yard for every yard moved above yardage unit prices paid contractors to cover entire grading cost. Total contract amount of earth was 47,278,121, the price varying from 19.3¢ for earth to 94.7¢ for solid rock. Experience shows that we must add 10¢ a cubic yard, or, in this case, about 30%, to cover the entire cost. Average yards moved, per mile, was 30,000; amount of excess cost varies with the country.

In the 19.3¢ average, the bids vary from 13¢ to 36¢. I don't think there has been much change in price of grading in last 10 years, considering the use of improved machinery. A fair price for earth work in iron country north of Duluth is 36¢ a yard, without overhaul, force account or other extra charges. That is for heavy work, and yards per mile run more than 30,000. My estimate of 36¢ was based on specific contracts, varying from 35¢ to 42¢ for earth work.

The estimate of reproduction cost of a railroad should include items for contingencies. We found that during 5 years, 1903-1907, the
587 total amount of additions and betterments to the Great Northern was estimated at $25,223,738.65, with an actual cost of the work of $29,096,067.47, an increase of 15.35%. The estimates were itemized in detail, and the engineers were familiar with the work to be done. That was the average; some actual costs fell below estimates. The estimates were made by competent assistants, and the work carried out by different, best fitted, departments.

I included 10% for contingencies in my inventory of Great Northern in items in which labor entered largely. Addition was not made to equipment items. The 10% contingency addition was fixed by

me upon my investigation which, showed an increased cost of 15.35%. Mr. Morgan, State Engineer, allowed 5% for contingencies on everything, which amounts to more dollars than my 10% allowance on principal labor items. In that litigation, the attorneys for the State contended there would be no allowance for contingencies, disagreeing with their engineers; my examination was made because of their contention. If valuation has been done with average care, 10% for contingencies would be sufficient; otherwise not.

I intended this 10% addition to be made only on items involving a large amount of labor, and not on all items. An allowance of 10% for contingencies on all items has usually been given in appraisals where the estimate was not based on complete records. I added 10% to some items, only, because our records were quite complete, and two thorough examinations were made.

588 We allowed 4.5% to cover engineering and legal expenses. Engineering expenses had been included in equipment item; 4.5% was applied to right of way and structures along the track, not to equipment.

In allowing for interest during construction we assumed it would require eight years to reproduce 2,000 miles of main line track in Minnesota. We allowed 6% a year for four years on everything except equipment. On that, we allowed 5% for two years. Mr. Morgan, State Engineer, took same periods, allowing 4%. The total allowed was 24% on all except equipment, and 12% on equipment. The court adopted Mr. Morgan's estimate of 4% a year. It now costs Great Northern 4.25% to raise money for improvements. It would cost more to obtain money for a new enterprise, without any credit; 6% would not be too high.

We did not consider depreciation; I do not think that should be taken into account in arriving at the value of railroad property. As an operating instrument, depreciation should not affect the value, e. g., Northern Pacific and Great Northern both have lines from St. Paul to Puget Sound, built for years, while C. M. & P. S. has built a line within two years. It is unfair to say either of the old lines was not worth as much as the new one. My opinion is that appreciation of track, roadbed, etc., offsets depreciation.

589 The maintenance cost of a new road is greater than of an old road, as roadbed of the latter is more permanent. The old road can be operated more cheaply than a new one, and the value of its use is therefore greater, assuming everything to be equal.

We allowed nothing for taxes during construction. In Minnesota, taxes are on earnings, and are not applied during construction. If conditions were otherwise, I believe such taxes should be included. Assuming a period of four years, and that South Shore is paying $200,000 taxes per year, the allowance should be $400,000. I do not know whether a new road would be taxed in Michigan before operation.

HOGELAND.

Cross-examination.

By Mr. Wykes:

The figures I have given were made for the purposes of Minnesota litigation. There was a variation between me and other witnesses, especially Mr. Morgan, on unit prices.

If a thorough examination of profile is made the contingency item would be decreased. The engineer should include in his inventory things visible and things he is reasonably sure happened. The items which could not be discovered should be covered by the contingency allowance. Every means ought to be used to discover and list items and quantities that have actually gone into the work; things should not be included that we do not absolutely know have gone into it, as it is covered by contingencies. I do not believe anything has been included twice. In favorable country, years afterwards,
590 where earth had gone into sink holes, out of sight, it would be taken care of in contingencies.

The unit price of 19.3¢ for earth was obtained by dividing the cost by the number of cubic yards moved, not including overhaul. Work done by the company was not included. The period covered was from 1898 to 1907, and all the lines on the system were included. There were 38 pieces of work, and the prices varied from 13¢ to 36¢. The 13¢ price was on a job in North Dakota, built in 1904; the next higher price was 13.3¢, for 46.97 miles in North Dakota. In getting the average, we multiplied the quantity on each line by the price per yard; those tables were all added and divided by the total yards, in order to arrive at the average price. A larger amount moved at the smaller price would have decreased my average of 19.3¢ or vice versa.

Some of my prices vary greatly, as, for concrete, from $7 to $12, depending upon length of haul, time of year, etc. Even knowing exact conditions, there would be some variation between engineers. I am not prepared to say, with the information I have and the distance I am away, that in a particular structure on South Shore concrete price should be $7 or $12; the same might be said of other unit prices.

In arriving at 15.35% as average excess, on certain contract work, of cost over estimated cost, we included all work done on system for years 1903 to 1907. I don't know that the work was carried out in each instance as contemplated; changes might have been made. In some cases, the cost underran the estimate.

591 In 1904, actual cost over-ran the estimated cost 16.65%, In 1902, 15.65%; 1905, 14.04%; 1906, 17.34% and 1907, 11.62%; an average for five years, 15.35%. The estimates of each engineer might vary from a minus quantity to over 40%. There is a large variation in the estimates which cover spurs, sidings, second track, bridge filling, new buildings, etc. It is quite likely that the

same percentage *or* variation would occur in estimates of a value of a constructed property for purposes of appraisal.

The table I prepared was for the purpose of justifying a contingency item. The size of the contingency item would vary with the degree of care used. No general contingency percentage should be applied, as every case ought to stand on its own bottom. As a mere opinion, I should think that South Shore would be justified in using 10% on entire estimate; I know nothing of the conditions.

The amount of interest would vary with the amount of line to be constructed, as that would determine the length of time it would take. We figure interest for full investment, half the time. In Minnesota figures, we had 2,056 miles; as that mileage is diminished, the time would increase.

HOGELAND.

Redirect examination.

By Mr. Butler:

After contractor goes away, the cost of removal of additional earth would be about the same as the contract price though, in some cases, it might be cheaper.

592 The time required to construct a road would depend on conditions in each individual case and not entirely on the length of line. I was mistaken in saying that the C. M. & P. S. was built in 2.5 years. It took nearly four years; they worked from both ends, and transported materiial over two other parallel lines.

593 On January 21, 1913.

JAMES MANEY, a witness called by plaintiff.

Direct examination.

By Mr. Butler:

I am, and have been, General Passenger Agent of plaintiff since Jan. 1, 1912; previously, from June 1905, I was assistant to General Passenger Agent. I have been with the company 29 years, having been Chief Clerk and Rate Clerk in passenger department.

I am familiar with the road, its operation of trains, connections, etc. (Time card, effective Jan. 5, 1913, marked Complt.'s Ex. 56, Maney introduced.) Prior to that time, for some years, the operation of the trains has been substantially on the same general plan as indicated by that time table.

Trains going west are given odd numbers, and east even numbers.

(In answer to specific questions, witness testified to the following things with regard to trains, operation, etc.)

THIS PAGE BOUND VERTICAL IN BOOK

595 (*a*) Negaunee to Houghton, cars are C. & N. W. and locomotives South Shore; train is operated over C. & N. W. line to Negaunee, where South Shore puts on its engine and crew. Train does local business between Negaunee and Houghton; South Shore gets all the fares, and some payment from C. & N. W. Sleeping and dining cars between Negaunee and Houghton run between Chicago and the Copper Country.

(*b*) Carry sleeping cars and diner.

(*c*) Dining cars entire distance; sleeping car St. Ignace to Soo Junction.

(*e*) Sleeping car for Marquette from Chicago; this is a C. & N. W. train, operated by their crew and engine; South Shore gets the fare.

(*d*) Chicago sleeper via Champion and the C. M. & St. P.

(*f*) Connects at Nestoria with 7 and 8; sleepers out of Houghton on 16 for Duluth and Mackinaw; sleepers into Houghton, from Duluth and Mackinaw, picked up at Nestoria.

(*g*) Connects at Soo Jct. with 43 and 8, and at Trout Lake with Soo Line.

(*h*) Through route, Chicago to Copper Country, via Champion and C. M. & St. P.; does some local business between Champion and Houghton; handled by South Shore our crew and engine, and South Shore receives the revenues, and something additional, from C. M. & St. P. sleepers and diners.

(*i*) Same as note (*h*) except junction at Champion or Republic, and no sleepers or diner.

596 (*j*) Connects at Soo Jct. with No. 1.

(*l*) Handle Lower to Upper Peninsula travel, and have a good deal of sleeping car business for intrastate passengers.

Sleepers from Lower Peninsula are handled on 1 and 2 and not on 7 and 8; that sleeper goes to St. Ignace; 7 and 8 handles St. Ignace sleeper to Mackinaw City.

Service substantially the same has been maintained on South Shore during past four or five years, except on trains 6, 8, 13 and 16. We are now operating daily sleeping car service between Houghton and St. Ignace, where, previous to a year ago, service was tri-weekly. There is no sleeper service in the winter. There are additional trains in summer. This summer we operated two Sunday trains between Marquette and Michigamme, 38 miles, and two between Duluth and Bibon, Wis., 72 miles, one each way—local for resorters.

I have frequently been over plaintiff's line in Michigan. I regularly receive, from accounting department, reports concerning results of operation of passenger trains, the earnings and the like; some are daily statements, and some more frequently; they have reference to daily passenger earnings.

Monthly reports show earnings by trains. In a general way, I am able to form an opinion as to the volume and kind of business of these trains during the last three or four years. I have not kept any statistics.

597 Complt.'s Ex. 57, Maney, is a list of passenger tariffs filed with the Michigan Railroad Commission, in effect July 1,

1912, and is now in force. It correctly indicates the Michigan tariffs on file with the commission.

(Agreement that tariffs on file may be used by either party, by being produced and called to the attention of the opposite party.)

Complt.'s Ex. 58, Maney, is a list of tariffs on file with I. C. C., including supplements.

Practically all local normal fares in any state, sometime or another become a part of or are used in the making of, interstate fares or rates.

Complt.'s Ex. 59, Maney, is the local passenger tariff of D. S. S. & A. in effect middle of 1911, with supplement 14 and was prepared by me, or under my direction, and states the fares and distances between all stations on our road.

Complt.'s Exhibits 57 and 58, Maney are lists of tariffs except one lately issued, effective June 1, 1912. (This tariff produced and marked Complt.'s Ex. 60, Maney.)

In addition to the tariffs referred to, there is one promulgated by other companies, which passes from points on our line to points on other lines. With that exception, all tariffs promulgated by foreign lines are from points on the promulgating line to points on our line. Our tariffs are one way fares, as illustrated by Complt.'s Ex. 60. Fares between the same points in opposite directions frequently differ.

598 Foreign lines, making rates from points on other lines to points on ours, use our local fare over the part of the line used in the route, as a component part of the through fare, in a majority of cases. The short line is the rate maker; the long line between the same points, to get business, meets that fare; that is uniformly the rule.

Between Sault Ste. Marie and St. Ignace, Soo Line furnishes a shorter route, South Shore being 90 miles, and South Shore and Soo Line, via Trout Lake, being 72 miles. I don't believe that we have any other similar situation in Michigan.

In Wisconsin, although plaintiff is not compelled by law to carry passengers at 2¢, it is compelled to do so through being paralleled by competitive lines, which are on a two cent basis. The Northern Pacific parallels South Shore, being as near as two miles in places, Superior to Iron River, the distance between these points on N. P. being 43 miles, and on South Shore 45 miles. On points on South Shore two miles distant from Northern Pacific, it is necessary to apply the same fare as the Northern Pacific applied to station opposite.

Duluth to Ashland is also a competitive point; the N. P. is direct, Duluth to Ashland; our route is Duluth to Bibon, thence via C. St. P. M. & O., to Ashland. Our distance and fare, Superior to Bibon, are 67.1 miles at $1.34. In my opinion, we could not maintain a three cent fare to Bibon. The N. P. is the rate making line,

599 Superior to Ashland; that handles business from Superior to Ashland by way of Bibon; the fare is in effect via N. P., which would not permit us charging 3¢ a mile. We could possibly

maintain a three cent fare for short distances in Wisconsin, though not for any great distance. The N. P. competition holds us to its basis on all of the line west of Saxon, in both directions, which leaves us free only between Saxon and the state line.

(Witness produced tarriff issued by foreign lines, showing rates from points on South Shore to points on other lines.) The rates read to points on our lines and to points on other lines via our line. They attempt to cover all gateways; e. g., Mackinaw City to Marquette, $5.03, made up of $.50 for Mackinaw Trans. Co. and $4.53 for our local from St. Ignace to Marquette; that is uniformly true to points in Michigan through St. Ignace gateway.

On business through Soo gateway from, say, Buffalo, N. Y., the through fare would make over Chicago or Trout Lake and be applied via Canadian Pacific, through Soo. We would get per mile, about .0258¢, Soo to Soo Jct. we have to accept a prorate per mile, which brings that down to the figure per mile stated.

This is an application of the rule that the short line makes the rate. This particular case would cover Buffalo and points in New York, east, where the through fares would make over Buffalo.

600 It would not apply to all territory naturally tributary to the Soo gateways; for the territory directly east, e. g., Montreal, Canada, fares would make over Sault Ste. Marie, and we would get our full local, Sault Ste. Marie to Marquette, $4.53.

If two cent law was put into effect the rate from Montreal to Marquette, made up of a combination of the fare, would figure $21.20, being $1.43 less than existing rate. I don't think we could maintain the interstate rate at the present amount if we were on a two cent basis in Michigan, as the passenger could buy to Sault Ste. Marie for $18.10 and rebuy, or pay cash fare, Sault Ste. Marie to Marquette, and save $1.43. That would be true to all points on our line in Michigan, out to Montreal. The same condition exists on all business where fares make over St. Ignace.

Where the fare is made over the Soo it would be modified by the differential on account of the rule of the short line making the rate. It would, however, be the full cent a mile for all distances west of Soo Jct.

This illustrates how, at two cents in Michigan, a passenger, Marquette to Milwaukee, where present fare is $6.16, could save 11¢ by buying from Marquette to Negaunee $.24 and Negaunee to Milwaukee, $5.81, total $6.05.

Newberry to Toledo, the present through fare is $8.84 made up of Newberry to St. Ignace, 54.8 miles at 3¢. If local fare from Newberry to St. Ignace was reduced to two cents, it would be $.55 less to Toledo, passenger could buy twice and save $.55.

601 St. Paul to Houghton, via C. St. P. M. & O. to Bibon, present fare is $8.65, made up of our local from Bibon to Houghton, $5.35, being 2¢ in Wisconsin and 3¢ in Michigan. St. Paul to Houghton, plus our proportion of the $3.30 from St. Paul to Bibon, gives us less than 2¢ a mile for 72 miles, resulting in the rate per mile being reduced all along. That is because the business comes by a roundabout route. We still get 3¢ a mile in Michigan, but our

total revenue is less than our local rate. The difference arises outside Michigan.

In business to Copper Country from the east, via St. Ignace, we do not get our full local, it will probably average about 2½¢ a mile from the interstate rate. The amount varies, depending upon whether the rate makes over the Soo, St. Ignace, Chicago or Milwaukee; where it makes over St. Ignace, we get our local; where it makes over the Soo we get less than our local, though the amount is not a constant amount, it depends on the distance.

On tickets from Buffalo to Marquette, we get $4 out of a haul of 155 miles. From New York we would get less, on account of the greater distance, the rate being but slightly higher than the fare from Buffalo, e. g., New York to Marquette, $25.33, making over St. Ignace, we get $4.20 for 155 miles—slightly higher revenue than on the ticket from Buffalo. This is made up of $20.80, New York to St. Ignace, and $4.53, St. Ignace to Marquette, our full local for 151 miles.

602 Montreal to Marquette, via Soo, we get our tariff fare of $4.53; our full local. New York to Marquette, via Soo, we would get $4.20 out of a total of $25.33; the fare is made up of $20.80, New York to St. Ignace and $4.53, St. Ignace to Marquette. The route via the straits makes the rate from New York City; if it comes via Soo, we get the same amount, being our full local from Soo Jct. plus a prorate per mile from Soo to Soo Jct. The fare from New York to Soo Jct. is divided—$3.15, New York to Troy, for New York Central and the remainder on a prorate per mile, using 248 miles from Troy to Montreal, 625 miles from Montreal to Soo, and 46 miles, D. S. S. & A., Soo to Soo Jct. If the two cent law was put into effect in Michigan, I do not see very well how we could maintain the 3¢ fare from Soo Jct. to Marquette on interstate business, in view of the fact that the passenger could buy and re-buy. The through rate would be greater than the sum of the locals, where that is true, a passenger can, if he knows it, and wants to, buy two tickets, instead of one, and save money.

Marquette to New York, via Soo, first class fare is $23.61, we get $3.09, being a mileage prorate after deducting arbitrary of $3.15 from Troy to New York City, for the New York Central. This fare makes over Milwaukee, east-bound, which is the short route.

Marquette to Lake Nebagamon, 227.3 miles the fare is $6.00, made up of 3¢ for 147.9 miles in Michigan and 2¢ for 79.4 miles in Wisconsin. With the local fares in Michigan at 2¢, this would be $1.47 less, I don't see how we could maintain a $6.00 fare, as the

603 passenger could buy to Thomaston; Thomaston to State Line is 13.6 miles; state line to Defer, first Wisconsin station, is 2.1 miles; Soo to Montreal, Mich. is 300.5 miles, $8.90; Soo to Defer, $8.95; under 2¢ fare from Soo to Montreal would be $6.01. With 3¢ fares on interstate and 2¢ fares on intrastate, a passenger from Soo to Montreal would pay $2.94 less than the passenger from Soo to Defer. Newberry to Superior 352.9 miles the fare is $9.50, made up of 3¢ per mile for 244.4 miles in Michigan and 2¢ per mile for 109.2 in Wisconsin.

MANEY.

Cross-examination.

By Mr. Wykes:

The reason, generally, that I say 3¢ could not be maintained for the interstate traffic, is the facility with which a passenger could buy a ticket over the territory in which he could pay 2¢, and thus get out of paying the 3¢ that might be charged on interstate traffic, by breaking up his ticket purchases. In going from Marquette to a point in Wisconsin, he could buy at 2¢ from Marquette to Thomaston, then up from Thomaston to Defer at 3¢.

There are now rates in Michigan upon which plaintiff gets less than 2¢ a mile. This is true as to certain local fares, and there is quite a little interstate business in which we get less than 2¢ a mile.

Duluth to New York City, second class fare, $24.00, brings us 1.629¢ a mile, Duluth to Soo. It is divided on the prorate per mile via Montreal, after deducting $3.15 for New York Central,
604 Troy to New York, 416 miles Duluth to Soo; 625 Soo to Montreal; 248 Montreal to Troy; that same ticket is sold at stations intermediate between St. Ignace and Duluth, at slightly reduced through fare.

Newberry to New York, second class is $21.79. South Shore would get its tariff of $1.64. From our main line stations, Marquette and west, the prorate per mile basis obtains; as you work east, the fare makes over the Soo, the same as Newberry fare did, not to exceed the fare from Marquette.

The business west of Marquette is based on the Chicago rate; except from Champion to Negaunee, the fares to New York are made over Milwaukee; Marquette being intermediate Negaunee to Soo, would take the Negaunee fare.

The second class ticket is the kind sold in connection with steamship tickets. All steamship business is handled in that fare; the first class ticket from New York is about $2.00 higher. The first class fare would be proportioned between the companies in the same manner. Duluth to New York City, second class is $24.00; based on $16.00 from Chicago, that figures 1.715¢ per mile. We would get a prorate per mile proportion of that fare after deducting the arbitrary, New York to Troy.

It would apply in that case from New York to Duluth. You go east on the line, take Marquette for instance, and you have another basis entirely, you get local in there from Soo Jct. to Marquette; this business comes to us via the Soo, we get that, plus a prorate per mile, Soo to Soo Jct., and that basis would apply to the big end of business from eastern New York to Marquette.

605 We get our locals from Soo Jct. plus a prorate per mile from Soo to Soo Jct. For instance, we would get our local, Champion to Houghton, plus a prorate per mile up to Champion.

The mileage prorate division on the proceeds of those tickets would apply to all stations intermediate between Marquette and Seney, it is

understood that lines east of Soo are not to receive more than the tariff fare, or their proportion of the tariff, from the Soo.

McMillan is about the point where we cease to get our local fare to or from Soo Jct. and begin to prorate the fares to points west on a mileage prorate, the reason is that we are making the rate via the Soo, starting from Champion.

We cannot charge a higher rate than we charge for Marquette, and we use the mileage prorate until the rate makes over the Soo. The rates are always divided on the basis they are constructed upon, except in some cases there is an agreement for a different division.

On immigrant business, there is considerable on which there is a return of less than 3¢ per mile, and quite a little on which there is less than 2¢ per mile; on first class tickets, there is considerable business where the prorate per mile is applied, and the South Shore gets around 2¢ per mile. This condition applies to tickets sold on the South Shore to points in southern Michigan and Indiana, e. g. Houghton to Fort Wayne, the South Shore proportion is 2.28¢ per mile; Saxon to Fort Wayne, South Shore gets from Saxon to St. Ignace, for 308 miles, 1.8¢ per mile.

606 Defts.' Ex. 5, states generally, the method of division of passenger rates, in which part of the travel is on South Shore, between the participating companies. The business, where South Shore participated in the division on mileage prorate basis, in many cases yields under 2¢; I would venture to say that the majority was slightly in excess of 2¢. There is a varying rate from 3¢ down, dependent on the location of the station on South Shore. We have no trains handling exclusive interstate traffic, and none handling exclusive intrastate traffic; during summer season, we have two trains, 211 and 212, between Marquette and Michigamme, being Sunday excursion trains, which handle exclusive intrastate traffic.

Those are low fare excursion trains which charge fare of 50¢ round trip, Ishpeming to Marquette, as against regular fare of 88¢, and 75¢ Marquette to Michigamme, as against $2.28 regular fare.

In trains stopping at a particular station, you let off interstate or intrastate passengers, or both. We have stops in Michigan scheduled for only passengers west of Wisconsin state line. None of our trains stop for purpose of taking on or of depositing a passenger of a particular character, interstate or intrastate, they stop to deposit them, promise-ously; they may be all of one kind or mixed.

None of our cars, including sleepers, run over C. P. R. Passengers all unload on American side at Soo; they there take through cars hauled by Soo line. The business through Soo, east, is good at times of the year, but, as a general rule, it is very light;

607 particularly in winter; all our passenger traffic is lighter in winter.

We have no equipment going on to the C. & N. W. regularly; there is a C. & N. W. train operated from Chicago to Copper Country, of C. & N. W. cars; if passenger came out of Houghton at night, he would use our cars to Negaunee, and change to C. & N.W. there. The passenger from points east of Marquette going out of the state, south, would change cars at Marquette or Negaunee. The passenger from

between Wisconsin state line and Nestoria, going out of the state, south, would transfer to the through train at Nestoria, on afternoon service, or, on night train, would go through to Negaunee and transfer there to C. & N. W. train.

There is no passenger service on the Bessemer branch 2.23 miles. On Republic branch, Houghton to Republic, the only passenger service is one train, No. 106, out of Republic en route to Marquette; that is C. M. & St. P. train, from Milwaukee, that runs through to Marquette, via Republic; it does not run over that branch on the return trip. That service has been in there about 10 years. There is no passenger service from Negaunee to Volunteer mine. On the spurs for traffic purposes—49 miles for 1910, 50 miles for 1911 and 62 miles for 1912—there is no passenger service.

Marquette to Winthrop Jct., 17.33 miles, no passenger trains use south track between Eagle Mill and Winthrop Jct. we have no
608 passenger trains between Eagle Mill and Negaunee on south track, we have no passenger trains using south track from Negaunee to Winthrop.

I have a statement, for October, 1912, giving revenue per train mile for various passenger trains; these are estimates. "Local fares" means tickets between points on our line. The figures are determined from ticket collections the- are not the exact figures, but are not entirely arbitrary, being based on knowledge of part of the income. The ticket collections give an idea of what is being done, so far as the business is concerned. It is sufficiently accurate so I think I have a knowledge of the train income from the examination of these. These are reports made to me for information of the officers.

(Sheets produced and marked Defts.' Ex. 6, Maney for July, Ex.7 for October, and Ex. 8 for November, being reports of train earnings.)

West of Nestoria, on main line, called Western Division, our interstate business is the greatest. The intrastate business on that division is quite light, due to lack of population—the local business is very light. I cannot give the relations between the inter and intra business there. The inter business is much greater, in my opinion. In my judgment, July, due to through summer traffic, would show a larger amount of interstate business; the interstate
609 passenger business predominates on the division east of Marquette to Soo and St. Ignace. Marquette to Houghton is where we have what population we have. This is through Negaunee, Ishpeming, Champion and Michigamme. The testimony with regard to the predominance of intrastate business on trains 1 and 2, St. Ignace to Houghton, would include both divisions.

On the Houghton Division, the intrastate business would predominate; there is considerable local travel there. The intra business might be close to twice the inter business on that division; if it is two to one for the whole state, it would be much more than that from Marquette to Houghton.

Mr. Wykes: That would necessarily be true, if he is right about the other two, that the inter predominates on the other two, because he would have to overcome all of that inter on this portion.

The relation of passenger miles was, 1910, intra 18 to inter 14; 1911, intrastate 19 to inter 13; 1912, intra 20 to inter 11. All our local excursion business is on the division, Marquette to Houghton. We have to use the Houghton Division to overcome the interstate business. The Houghton Division is heaviest in both inter and intra traffic; the mileage is: Houghton Division, 95 miles including Republic Branch 112.5; Western Division, 101.5 miles; Mackinaw Division, 197.9 miles. The south track, Marquette to Negaunee, ought to go in Houghton Division.

I have stated the Houghton Division to be heaviest in both inter and intra business, taking the year through; next to the
610 Houghton Division, the Mackinaw Division, east of Marquette, is the heaviest in interstate traffic; the Mackinaw Division also comes second to the Houghton Division in intrastate traffic; that is much heavier than the Western Division.

In my opinion, train 7 handles more interstate than intrastate business, comparing it with the rest of the trains. On 7 and 8, the inter business is also heaviest, and that is based on the fact that the trains have very few stops and are run to cater to long-haul traffic.

When in my testimony I stated that a certain train was the average, or above or below, I meant there was an average income of $1.19 per train mile, and classified trains as falling below or above that amount in earnings.

When I stated that the intrastate business predominated on trains 7 and 8, I had in mind the volume of business during the summer months, out of the Soo, but other considerations lead me to assume that the bigger portion is interstate business. An exact determination could not be made. There are now three lines between Eagle Mills and Negaunee.

(Defts.' Ex. No. 5, Maney, being method of division of rates between participating companies, introduced by plaintiff.)

MANEY.

Redirect examination.

By Mr. Butler:

My testimony as to the relative amount of interstate and intrastate business on trains was based upon general familiarity
611 with movement of traffic; I have no figures, calculations or accounts to support it; this is also true as to the comparisons made with regard to the relative density of the traffic of different characters on different divisions. I have nothing to do with operation, and there is no reason why I should be more familiar with the tracks operated than any person occasionally over the road.

MANEY.

Recross-examination.

By Mr. Wykes:

July and December or January and July would be fair months for determining the density of traffic.

612 On February 19, 1913.

CHESTER J. MCPHERSON, a witness called by Plaintiff.

Direct examination.

By Mr. Butler:

I have spent upwards of 30 years in operating department of railroad service. I entered railway service as Telegraph operator at 16 years; later was station agent, train dispatcher, chief clerk to superintendent; general yard master, chief dispatcher, chief clerk to general superintendent and master of transportation, with Terre Haute and Peoria, a part of Pennsylvania system. For 20 years I was with Illinois Central and Missouri Pacific; for past seven years as assistant to general manager of latter. I have given much attention to matters affecting cost of railway operation and expense incurred in different classes, and to railway economics, which necessitated inquiry of all lines of operation. For 20 years I have sought to get a check on railway efficiency, checking various units of operating department, by divisions; I have traveled all the lines of inquiry, seeking truth as to costs.

For Missouri Pacific I prepared formula for operating costs, seeking unit costs in all departments. I was a witness in Arkansas and Missouri rate cases, in which Missouri Pacific was involved, and, as representative of that company, I assisted in preparing the formula on which division between states was made. In both cases, the question of reasonableness of state-made freight and passenger rates was involved. I was also an expert witness in Minnesota Rate Case (for N. P. & G. N.), involving freight and passenger
613 rates, and in Chicago, Peoria & St. Louis case, recently decided, involving Illinois 2¢ passenger rate.

I have examined Complt.'s Exhibits Nos. 1 to 49 in this case. I have become familiar with operating conditions on South Shore, by going over all parts of the road in Michigan, except Republic branch.

I have examined exhibits in this case dividing expenses between states, and Michigan proportion between freight and passenger. Complt.'s Ex. 41 Delf (method of division of operating expenses between states, and Michigan proportion between passenger and freight), is the method generally used. Because of a simple situation, it is closer, as to amount allocated, than has been reached in other cases I have examined; one difference exists; e. g., some rail-

roads have used gross revenue basis to divide general expenses between states; whether that is any closer is a question in my mind.

The method of Complt.'s Ex. 41, Delf, is very close to, and does not differ materially from, that followed in any other case, where same issues are involved. Portions of three maintenance of way expense items, roadway tools and supplies, stationery and printing, and other expenses, not allocated between states, are occasionally divided on track mileage basis, the amounts represented being small.

In instances in which track mileage basis is used for division of unallocated expense items between states, I know of no
614 other basis or factors that would as nearly reach the truth, and that is a fair and proper basis.

(Witness approves division of 96% maintenance of telegraph and telephone lines between states on total miles of wire in each state.) (He also approves various divisions of unallocated expense items between states upon basis of Complt.'s Ex. 41, Delf, as follows:)

Maintenance of equipment:

Superintendence.
Steam Locomotives—Repairs.
Steam Locomotives—Depreciation.
(Divided on revenue locomotive mile basis. A division might be made on train miles, which would be relatively the same.)
Passenger Train Cars—Repairs.
Passenger Train Cars—Depreciation.
(On basis of passenger car miles.)
Freight Train Cars—Repairs.
Freight Train Cars—Renewals.
Freight Train Cars—Depreciation.
(On freight car mileage.)
Shop Machinery & Tools.
(On basis of revenue train miles.)
Each State Charged with Injuries Occurring therein.
Stationery and Printing.
(On basis of Revenue Train Miles.)

Traffic expenses:

Superintendence.
Outside Agencies.
(Allocated between passenger and freight, and divided between states on appropriate train mileage.)
Advertising.
Traffic Associations.
(Separate freight and passenger items on appropriate train mileage, and joint items on revenue train mileage basis.)
615 Fast Freight Lines.
(On freight train miles.)
Stationery & Printing.
(Separate items on appropriate train mileage, and joint items on revenue train mileage basis.)

Transportation expenses:

Superintendence.
(On revenue train mileage.)
Dispatching Trains.
(On revenue train mileage basis.)
In dispatching trains the train is the thing dispatched; this is whether the passengers be 1 or 100; the train is the unit.
There would be the same amount of work to dispatch a train as a locomotive.
Weighing and Car Service.
(On freight train miles.)
Station Supplies and Expenses.
(On ratio of station employes' account.)
Road Enginemen.
Enginehouse Expenses.
(On locomotive miles.)
Fuel for Locomotives.
(On locomotive miles of each class of service.)
Water for Road Locomotives.
Lubricants for Road Locomotives.
Other Supplies for Road Locomotives.
(On ratio of fuel for road locomotives.)
Road Trainmen.
Train Supplies and Expenses.
(On basis of revenue train mileage.)
Stationery and Printing.
Other Expenses.
(On basis of revenue train mileage.)
Loss and Damage—Freight.
(Freight train basis.)

616 General expenses:

Principally divided on revenue train mileage basis.
Insurance and Equipment.
(On basis of mileage of each class of equipment.)

Referring to Complt.'s Ex. 41, Delf, division between passenger and freight I approve the use of revenue train mile basis for dividing common or unallocated items of expense between the passenger and freight services, giving as reasons:

(*a*) That there is no other basis I consider of value, after much thought and having tested it, or that could be used, and arrive at anywhere near a correct division.

(*b*) Apart from the fact that much of the expense of maintenance of way and structure does not occur from use, the expense due to use arises from train miles in freight and passenger service.

(*c*) The train miles are the causes for the expense of use; the track must be maintained to a standard that will give efficiency and service, both freight and passenger, and for that reason the division would naturally follow the use or cause of the expenses.

(*d*) All there is to a railroad, after all, is the operation of its trains; it all simmers down to train operation; that is all that brings in revenue.

(*e*) I believe it the proper and only factor for maintenance of way and unallocated expense in maintenance of equipment and traffic.

617 (*f*) This brings up question of relative cost of passenger and freight train mile; it is true that they are different; the passenger train mile is made at an authorized speed of double the freight train speed.

D. S. S. & A. time table No. 299, Western Division, effective Jan. 5, 1913, prescribes maximum speed of freight trains as 3 minutes per mile and passenger 1¾ minutes per mile, running time, taking water, irregular stops, etc., not included. Houghton Division time table No. 228 (Complt.'s Ex. 63), effective Jan. 5, 1913, maximum speed of freight train, 3 minutes per mile; passenger, 1.5 minutes per mile. Mackinaw Division time table 221, effective June 30, 1912, maximum speed of freight trains, 3 minutes per mile; passenger, 1.5 minutes per mile.

Considering only that passenger train miles are made at higher speed than freight train miles, with a heavier train, there would be such a difference that one would hesitate to use train miles as a factor in dividing common expenses, but, to one acquainted with practical operation, it is possible to go further than those two factors, and see whether one service imposes limitation on the other, and whether those are sufficient of themselves to equalize practically the expense of the two classes of train miles, as the best factor for dividing expenses that cannot be definitely ascertained; the division would not be exact, but it would be nearer the truth than any other I know of.

618 Construction and maintenance must be such as to meet the maximum service; there is much curvature on nearly every railroad, which must provide an elevation for the maximum speed of trains, and a little wider *guage* to prevent binding and overcome centrifugal force. This imposes a limitation on the freight trains which would not require that elevation with a maximum speed of 20 miles an hour; the result is greater wear of freight trains on the track, an element to be considered in equalizing between the two classes of miles.

The passenger train service is preferred; the freight train must take the side track. This causes an expense imposed upon freight service by passenger service, both of transportation and maintenance; the freight train takes the side track to meet and to let passenger trains in the same direction pass it; it must stop, the switch be opened, and pull ahead on to the track, and stop again. After the passenger train has passed the freight pulls out of the sidetrack slowly, to allow the trainmen to set the switch and get on the train; so that causes two stops and starts to that train, which are an element of expense.

In maintenance of way expense, there is the wear on switch points and frogs, due to use by freight trains, but necessitated by passenger trains. While the train is on the side track 25, 30 or 50 minutes, it

has been using coal, water and other supplies, which, while charged to freight, is due to passenger train.

619 The only element of a train exerting tractive force is the locomotive, and the larger wear of tracks on a tangent is caused by locomotive. On curves, more or less wear is due to car wheels, due to the fact that guage is wider and outer rail is elevated. Freight trains have greatest number of wheels to cause wear on such curves, but that is incident of passenger trains, freight trains don't require the refinement of track to meet high speed service, but must take the consequences of it, which makes their wear and tear greater than if the railroad were built expressly for freight service.

This basis does not reach the division of expense exactly; railway companies, for their own purposes, have adopted the factor of train miles to test their own efficiency of operation; if there were a better unit, they would use it.

A large part of maintenance cost is due to other causes than use; what would divide the cost we know is incident to the train should be employed to divide cost that cannot be allocated to other causes. The reason is there is no way to measure it in units of operation, but it is an expense that must be paid; the best measure, in our judgment, for dividing expenses caused by trains would naturally be the basis to use for the entire.

(The witness gives items where repairs and renewals are not due to wear of train movement; of removal of sand, snow and ice, revenue train mile, basis charges as much to freight as to passen-

620 ger; if anything, passenger should bear more than is charged to it of bridges, trestles and culverts. Certain of the items are hardly affected by wear; so, also of telegraph and telephone lines. Stationery and printing would not be affected by train service; of ties, wooden bridge stringers etc., expenses are due to both causes. The extent of increased wear by freight trains, due to refinement of construction and adjustment in track necessary for passenger service, cannot be reached with certainty.

My idea is that expenses incident to stopping and delaying freight trains are properly chargeable to passenger business. I have made a study of time table and operating sheet of South Shore, to make a chart illustrating the necessity of such stops on that road if the trains moved on schedule, and have participated in making such a chart. The chart (Complt.'s Ex. 62, McPherson) is for Houghton Division, and shows both the normal movement per schedule and the actual movement, or time such train passed a station; I used time table previously referred to (Complt.'s Ex. 63) to take effect Jan. 5, 1913; the time table shows the movement of trains as planned for comparison of the movements as they appear to have occurred by the train sheet (Complt.'s Ex. 61 McPherson).

In operation of passenger trains, a greater length of track is reserved for their exclusive use than for a freight train moving in same direction, as a passenger train runs twice as fast. This means a passenger train must be given between 25 to 30 miles use of

621 track; anything less gives a chance for interference to delay passenger trains. They move a freight train just as far as

they safely can against a passenger train and enable it to get on a side track out of the way. I don't mean freight trains are to be 30 miles out of the way of passenger trains, but I say that, if they are coming together, that is the amount of track behind the passenger not being used and between it and the freight not being used. The passenger train, having run so much faster than the freight train, has left a considerable distance between the last freight and itself. The freight train would have only what she could accomplish and keep off the passenger train's time, or was helped by the train dispatcher; I don't believe I could express that in actual figures; this testimony all refers to single track operation.

The passenger train service is preferred, having first call on the railroad organization: I have heard men of experience and good judgment express the opinion that passenger business on any single track railroad is a losing business.

The company's material *of* freight is carried almost wholly on freight trains, the expense of which is in freight account. On certain railroads, investigation indicated that one and one-half to two tons per car, or about 2% to 2.5% of the freight ton miles, are company freight. The percentage would vary on different roads, due to the tonnage of revenue freight traffic, and the need for material and fuel; it would be a substantial item, but I know nothing of local
622 conditions on D. S. S. & A. Other things being equal, the smaller the amount of revenue business, the higher the percentage, to revenue, of the company's freight would be.

My answers as to the propriety of the revenue train mile basis of division of expense was intended to cover its use wherever employed in Complt.'s Ex. 41 Delf; I believe it the best, and, while not perfect, the only largely reflective basis.

I also approve other bases for the division of certain items between freight and passenger, as used in Complt.'s Ex. 41 Delf, as follows:

Maintenance of equipment:

Superintendence.
(On Michigan revenue locomotive miles.)
Station Employes.
(On revenue train miles.)
Station Supplies and Expenses.
(On ration of station employes.)

Transportation expenses:

Yard Expenses (12 items).
(Divided 10% to passenger and 90% to freight; this is largely a local question, requiring observation of the work done by switch engines; all roads make that division in an arbitrary way; the percentage arrived at by observation of the operating and accounting man; I have no familiarity with South Shore situation, but approve the method.)

Water for Road Locomotives.
Lubricants for Road Locomotives.
Other Supplies for Road Locomotives.
(On same basis as fuel for Road Locomotives which is allocated between passenger and freight.)

623 These divisions between freight and passenger, through use of revenue train mileage, are not a matter of accounts, nor kept by the railroad as accounts. It would be impossible for the railroad to make a division in its books between freight and passenger; there is no necessity in the railroad's operation to do that, so we must go to a matter of statistics for which this division has been used many years.

The Interstate Commerce Commission before 1894 demanded such a division on an arbitrary basis. That was wrong, it could not be done on that kind of a basis, because the question was one of determination on different bases; that was abandoned 20 years ago.

So far as I know, the division by railroads is substantially as given here; in fact, it was adopted by both sides, with no contention, in the Missouri Rate Case; there, the source of contention was between interstate and intrastate in freight and passenger.

Substantially, the train mile basis was used as indicated in Complt.'s Ex. 41, without enough variation among all the railroads to be material. Among operating men, there is a concensus of opinion that the factor for the division between freight and passenger as here used is the best known factor. Complt.'s Ex. 61, 62 and 63, McPherson, introduced.)

624 I do not intend to indicate by Complt.'s Ex. 61 McPherson or claim, that all the delay indicated by the chart was made necessary by meeting freight trains; there are a good many that are due to the passenger trains, and a good many that are uncertain. There are a good many of these delays by freight trains that a man, reading the chart and familiar with train operations, is certain are caused by waiting for passenger trains, but he would not want to testify to it as an actual fact.

A man who has been a train dispatcher, looking over Complt.'s Ex. 62, would come pretty near figuring out the delay caused by waiting for passenger trains, but could not tell how much of it was due to the waiting and how much due to station work, without examining the train sheet and seeing that the train had its maximum number of cars and had no work to do at that station.

(Complt.'s Ex. 43, Delf.) The Michigan passenger operating expense will be divided between interstate and intrastate on the basis of the earnings of each, with an addition to the intrastate business, to represent the greater cost of handling intrastate passenger over the interstate; this is the revenue basis equated. There is a sufficient data on Complt.'s Ex. 43, Delf, on which to base an opinion, and I have formed one—that it costs approximately a minimum of 25% more to produce an intrastate passenger mile than an interstate passenger mile. This opinion is based upon the following:

(*a*) Average journey of intrastate passenger, 1910, was 31 plus miles, while, for interstate it was 143 plus miles.

625 (*b*) Substantially 4.5 different people, on the average, travel over the line in Michigan to produce the same number of intrastate miles as one passenger in Michigan 143 miles.

(*c*) This means a greater use of terminal facilities by intrastate passengers.

(*d*) Intrastate passengers both board and leave the trains in the state, and, in the ratio of 4½ to 1, there would be a ratio in use of terminals of 10 to 1.

The excessive use of terminals requires additional selling of tickets, loading, unloading, checking and putting baggage on and off trains, use of terminal facilities, etc., terminal facilities means, at each station, wages of employees, maintenance of stations and platforms, cleaning, heating, lighting, supplies, ice and water, etc., which make up a large part of the expense of passenger operation.

The number of persons travelling were, in 1910, intrastate 488,745, or 85% and interstate, 100,748, or 15%. Doubling terminals for intrastate makes intrastate 92% and interstate 8%, which indicates the actual physical use of terminals.

Table by Delf (Complt.'s Ex. 64, McPherson), shows interstate and intrastate tickets sold for the year ending June 30, 1912.

This shows, for local tickets sold in Michigan, 98% intrastate; for coupon tickets, 75% intrastate; combined local and coupon tickets sold, 94% intrastate.

626 Each intrastate passenger would use terminal twice and interstate passenger once, making relation of 92 intrastate to 8 interstate, or 11 to 1.

Table by Delf (Complt.'s Ex. 65, McPherson), of ticket sales for year 1911 shows, for local tickets sold in Michigan, intrastate 98%, coupon intrastate 75.5%, local and coupon combined 94% intrastate.

Risk of injury in boarding and leaving trains would be 92% intrastate and 8% interstate for 1910, and risk of train accidents 85% intrastate to 15% interstate (the latter obviously wrong and later corrected, and still wrong.)

The risk of train accidents would probably depend upon distance traveled, and be as 4 intrastate to 1 interstate.

I have examined annual reports of D. S. S. & A. to Railroad Commission of Michigan for 1910, 1911 and 1912; they show, for passenger trains:

Year.	Average cars per train.	Average passengers per car.	Average passengers per train mile.
1910	4.33	13	42
1911	4.42	13	43
1912	4.32	13	43

This shows three passenger cars per train on an average. The seating capacity of these cars (allowing 15 for cafe observation cars) would be 123 people, while only 42 used them, on the average, showing an additional car over the average use; this becomes necessary

627 to provide accommodations for maximum number of passengers at any point between terminals. On account of uncertainty of short haul business, 25% of the expense of that train is due to provision for intrastate business; that would not apply to interstate.

I do not say it would apply to entire cost, as no more train employees would be required; there should be assigned to it 25% of the haulage cost and 25% of the cost of maintenance of equipment of the train and depreciation, and of the maintenance of way assigned to that train as between the cars. It would be hard to give an exact figure for it, or to estimate, as it is not possible to separate the costs common to all the cars of the train. There is no known way of keeping the cost of interstate passenger business separate from the cost of other business, by accounting; the assignment of costs between interstate and intrastate is, at best, an approximation.

But there is a certain amount of synthesis in it, because of factors greater in one case than the other, as (*a*) length of haul, (*b*) additional equipment, and (*c*) greater number of stops for intrastate passenger than for interstate.

Train No.	Route.	Mileage of route.	No. of stops.	Average miles between stops.
1	Houghton to St. Ignace	245	59	4.17
2	St. Ignace to Houghton	"	57	4.31
3	Marquette to Houghton	94.5	17	5.56
4	Houghton to Marquette	"	18	5.25
5	Nestoria to Duluth	109	32	3.09
6	Duluth to Nestoria	"	32	3.09
7	Duluth to Soo	302	22	3.75
8	Soo to Duluth	"	21	14.41

This is mileage in Michigan and this train is interstate carrying also local business.

628 In some instances, the excess cost would be above 25%; in some it would go below; I take it that that would be the average. The average is at least 25%. I do not recall having used the word minimum before; if I did it was not intentional. In my judgment, the excess cost would not fall below that average. I think the cost due to stops of passenger trains at stations should be divided on the number of passengers; of course, each stop would take care of any number that wanted to get on or off. I should say that the ratio would be about ten intrastate to one interstate, taking the average length of haul. If the company were doing simply interstate business, the average stops required would be at 143 mile intervals; while doing intrastate in connection with it, they would stop every 31 miles. Both terminal expenses—taking and leaving trains—should be taken into consideration with intrastate passenger. (Complt.'s Ex. 44, Delf, freight statistics) Leaving out of consideration the ore business, the elements upon which an opinion of the relative cost per ton mile of the intrastate and interstate freight business in Michigan, in each class, must be formed in this case, in the absence of division of less

than car loads, would be the length of haul. The intrastate freight business moved an average distance of 62.35 miles, while the interstate moved an average of 108.28 miles; there was a greater cost in producing a ton mile of intrastate than of interstate freight, due to the greater use of terminals and equipment; two terminals are attached to intrastate and one to interstate business, as a general
629 proposition—108.28 miles with one terminal expense, as against 62.35 miles with two terminal expenses required for intrastate business; two cars as against one car for interstate business. It is axiomatic that the cost per mile, as applied to ton miles, decreases as the length of haul increases. This is on both carload business and less than carload business; two cars being required for the same amount of intrastate business would require double the capital, the depreciation, switching and station employe service of billing, abstracting and handling accounts.

The basis for the conclusion that two cars are necessary for intrastate business to one for interstate is purely on the length of haul; interstate haul averages 108.28 miles; intrastate averages 62.35 miles. After you have gone to the expense of making your 62.35 mile shipment, before you have attained the same number of ton miles, it would be necessary to make another interstate shipment of 46 miles, and each shipment would have a terminal at each end.

Shippers are allowed to use the cars at either end of the shipment for 48 hours; to produce 108.28 miles, therefore, in the intrastate business, eight days have been lost in the use of the car, in time consumed in transporting it between the points, as against two days' use lost for interstate shipment in Michigan; the relation is four to one in the investment in and use and depreciation of, cars.

As to switching, there would be six switching movements in Michi-
gan in the intrastate shipment and one in interstate; the
630 hauling of the cars, if tonnage were equal and class the same, would be of equal expense, per ton per mile, in interstate and intrastate; I should say that it cost twice as much per ton mile, on an average, in the intrastate business as it does in the interstate business; I apply that to all stationary and rolling expense attached to transportation.

Applying to the total expense, including general expenses, based upon the rate per ton mile, it would cost double the amount to produce the intrastate ton mile over the interstate, embracing all expenses that would attach to freight cost.

The General Managers Association has made a tabulation of the gross earnings made by freight cars per day throughout the country; it is in excess of $3 per car per day, while the company gets $1 for demurrage. The illustrations given indicating extra cost of intrastate over interstate business, are confined entirely to carload business.

The less than carload business is the most expensive business that a railroad company handles. In cost of less than car load freight, as between state and interstate, the average haul enters as a very important factor, due to light loading of cars; there is always a much larger average haul on interstate than on intrastate, and the use of

the equipment would multiply in relation to length of haul; if the haul were 100 miles interstate and 25 miles intrastate, there would be four times the use of equipment to make the intrastate ton miles that there would be in the interstate ton miles.

631 In the matter of cars, the same relation would exist, as explained in the carload freight. Generally speaking, the cost of handling intrastate L. C. L. business is at least five times as great as intrastate. I put the maximum as five times as great, it may be eight times; the more I analyze this question the more I have become confident that our opinions have been too low on this extra cost.

McPherson.

Cross-examination.

By Mr. Wykes:

I assume the L. C. L. business was equally divided as between intrastate and interstate; in the figures given, no division between carload and less than carload was given. I took the entire tonnage on the assumption that there was an equality between the L. C. L., and assumed in my answer, based on the length of haul, that the carload business alone was two intrastate to one interstate.

There was nothing whatever from which I could separate the amount of carload and L. C. L. business; my percentages would apply with regard to conditions as they actually existed (for that cannot be separated), unless it developed that there was a greater difference in the length of haul between less than carload that there was between the total. I have assumed the same length of haul in both cases. Where the freight is L. C. L., both classes would be carried in the same train, and probably in the same car; I am not prepared to say what the loading—the proportions—of interstate and

632 intrastate in any particular train or class of trains would be. With L. C. L. interstate and intrastate in the same train, a car of intrastate would be unloaded and peddled out as you went along, while the interstate would probably be retained in the car for another haul.

There is a possibility that a particular train might have interstate freight for all stations along the line. The car might go from Duluth to Marquette, containing interstate freight only to Marquette or stations west; when part of the interstate freight is unloaded, for the purpose of economy of operation intrastate freight might be loaded into the same car, that is, the car would be utilized as far as it could be.

The density of class freight is not as great as of carload freight; this is equalized more or less in the class rates, and for smaller freight there is a considerably higher rate than for carload shipments.

The rates fluctuate somewhat with the length of haul on less than carload business—the shorter the haul, the higher the rate, as will be observed from the distance tariff.

Q. And so, before you can determine whether there is a profit on

a particular class of business, you must compare the cost of hauling business, must you not?

A. You couldn't determine that, prehaps, individually, only in a general way, but, taking the class and the average length of haul, you wouldn't determine the exact cost, but you would determine a relative cost between that and the commodity.

633 Q. But even then, to determine it relatively by classes, involves, an examination of both sides, that is, the rate and the cost, or the revenue and the cost?

A. The exact cost cannot well be determined, we can only approximate that, that is a matter of judgment. The unit cost of carrying freight on a railroad cannot be reached; we can get an average cost per ton per mile by reducing it to ton miles and then applying observation of the work or efforts necessary, the way it is handled, the bulk, etc., by an addition to the ton mile, would be able to reach somewhere near an approximation, possibly. We tried to do that, but it is not exact.

Q. So I understand you to say that it is not possible to get at exact costs for particular commodities or particular shipments?

A. No.

Q. Nor is it possible to get at exact costs for particular classes, even there it is an approximation, but when you have approximated the cost for a particular class, to find out whether that particular business is profitable, you must compare the revenue from that particular business with the cost for that particular business, as you reached it by approximation, is that true or not?

A. That would, of course, be necessary, to bring in the revenue, to determine whether or not it was profitable, but the labor of

634 ascertaining the cost of any one class compared with another class, by investigation, would be prohibitive, and after you had secured it in one instance, you might find a different condition that you would vary that very much.

Q. When I spoke latterly of the class, I meant the class as between inter and intra, and even there you must reach it by methods of approximation?

A. Certainly, you must reach it by those elements I spoke of this morning, that is, the length of haul.

Q. And the more familiar you are with the operation, the character of the traffic and the particular difficulties the railroad has to contend with, the closer you may get your approximation?

A. The more you are familiar with those conditions, yes.

My idea was that the car costing $900, with annual maintenance of $65, would earn $3 per day gross, on an average; the $1 demurrage is not compensatory. The $3 is determined by dividing freight revenue by the number of cars.

My cost of two to one in intrastate over interstate was based on two terminals for intra and one for inter and on the relative length of haul, there would be four terminals for the same length of haul on the intra and one on the inter.

There might be exceptions to that general rule; I gave no weight to, and did not take into consideration, the exceptions, their volume,

or what they were, because even if a car is handled twice, it would be rarely the case that the second terminal on an interstate shipment would equal either one, the originating and the destination
635 terminal, there might be some expense attending an intermediate station. I am basing it on the general proposition that an interstate shipment has but one terminal within the state.

To equal the 108.28 mile haulage of interstate in the intrastate, there would be one shipment of 62.35 miles and another of 46 miles, each involving two terminals; the 46 miles would be necessary to reach the average length of interstate haul.

The character of the terminal—whether at the Soo or at Nestoria—and the cost of the terminal would make no difference in the actual cost of handling the car through them; the process of handling the car at the Soo is precisely the process of handling at Nestoria, so the cost might be very closely the same in the two cases.

The value of the property on which the work was done might be greater and undoubtedly would be greater, at the Soo than at Nestoria; the value of the use of the terminal would not be any greater, because we get the same service out of each, the use, as measured by expenses, would be exactly the same. If you were going to determine the value of the use, you would have to go into revenue; you could not determine the value of the use by your expense, you would not get a solution to your problem of value.

If you were fixing a rental for these two terminals, the rental at the Soo would be much larger than at Nestoria, because you were
636 dealing in values; I didn't make any examination to determine what proportion of the interstate business has more than one terminal in Michigan, that would be a local condition.

I can imagine intrastate shipments on which there would be only one terminal; I made no examination to determine the volume of interstate business having two terminals; that would be exceptional, though it might be true. As against interstate business having two terminals, there is much interstate business with no terminal expense in Michigan, e. g., business from Copper County on Copper Range and Mineral Range, beyond Houghton, to Chicago, by C. & N. W., there would be no terminal expense attending that. Terminal expense for those shipments would appear in accounts of Mineral Range, Copper Range and C. & N. W.

The basic consideration of difference between cost in intrastate and interstate freight business is the length of haul, involving the greater use of terminals and cars and greater amount of switching; the switching item in freight business is a very large item of cost. The switching cars into and out of industries may involve distances of miles, which would be additioual cost; distance would cut little figure in the natural breaking up of cars—in yard work.

My testimony throughout was exclusive of the ore business, and I don't intend to embrace that in any of my figures.

637 In passenger business, I made no investigation to determine amount of interstate business having two terminals in Michigan, but testified on the assumption that interstate business had one and intra-state two, here, also, you have your trans-state passenger

business with no terminal on South Shore—Passengers from Calumet to Chicago, or from Canada to Duluth, would have no terminal service on South Shore.

Q. Would that be true if they transferred at the Soo station; would you say there wouldn'- be a terminal charge?

A. There might not be a full terminal service; that is, the agent wouldn't be called on to sell tickets or to check the baggage; a man might have bought his ticket in Toronto or Montreal, Canada, and his baggage would be checked through to his destination, but there would be the physical necessity of handling his baggage,

Q. And also transferring him and getting the car ready to put him at that terminal?

A. Yes, providing the facilities for transporting him.

The Master: You wouldn't call a change of cars at a transfer a terminal service?

A. Well, I don't know, you might denominate it as a terminal service, it probably would be as much a terminal service as a man alighting from a train and having his baggage put off, except that there would be a difference in accounting, expense, there would be no
638 accounting expense at all at the Soo, while there would be an accounting expense with a passenger alighting with his baggage at his destination.

The percentage of passengers checking baggage is comparatively small, and depends a good deal on the season of the year. I have found that the greatest checking of baggage has been in the intrastate as a rule. Traveling men carry baggage, having it checked from station to station; the number of terminal services they get is enormous—short distances. I have made no investigation to determine the ratio on South Shore; I simply assumed commercial conditions did not vary much in different parts of the country.

As between the interstate passengers themselves, there would probably be a bigger proportion than of intrastate who would have baggage, but the intrastate passengers are so dominating in number that when a few of them check baggage it is still of greater quantity. On the proportion of passengers, the intrastate would run less than the interstate on the basis of passenger miles, it might work out that there was a larger proportion of interstate; i. e., the distance hauled, as represented by miles, might be greater in the interstate business, but the baggage would not have as many terminal services. There is a possibility, of interstate and intrastate passengers for each station; I presume you could find stations on every railroad in the country at which there would not be an interstate passenger in a year. If they are going to go on a long journey, they
639 probably would make their arrangements to go to some large town where they would get full information and start the journey from there, and even then there are relatively few people that make interstate journeys in proportion to the intrastate.

With everybody, an interstate journey a few years ago was an undertaking; today, it is rendered comparatively easy by the conveniences afforded by the railroads, and still there are stations that I know *if*, on the roads with which I have been connected, where,

during my connection with them and intimate acquaintance with the villages, there probably wasn't an interstate journey made; they had cities of good size in the state, and that is where they visited.

It costs no more to stop to let off ten passengers than one, except the length of time necessary to unload extra people.

In reaching additional cost for intrastate passenger, there are some items of additional cost not amounting to 25%, and others which I am satisfied amount to many times that. Viewed ralatively, if a train stopped for ten passengers, nine of whom were intrastate and one interstate, 90% of the cott of that stop is properly chargeable against the intrastate business; I don't say that it would actually increase the expense though.

If we were going to refine the question by close analysis, the relation in that cost would be nine to one.

640 Now, so far as the railroad company is concerned, it is not a penny either way in difference in the cost of the stop, but if the cost of the stop, say, instead of a dollar, probably would amount to two or three, and you are going to analyze that, the division of it as between state and interstate, why, it would be in proportion to the number of people accom-odated. The intrastate would get nine times the benefit of the interstate.

The primary difference in cost in the freight department is dependent upon the length of haul; this is also true in the passenger department, bringing about the conditions I have enumerated. There are other very important elements. The greater number of passengers traveling in one service than in the other produces a cost of more cars to handle, greater use of station platforms, waiting rooms, facilities and expense of hauling, lighting, cleaning, supplies and employees; the figures show 85% intrastate and 15% interstate using the stations, and the number buying tickets from the agent, 94% intra and 6% inter; the other interstate passengers represented people who came on to the line with tickets purchased elsewhere.

At a one man station, it would be necessary to have the agent there for either class of passengers; but, if it were not for the local passenger, you might not need any, because of the interstate travel not being so general; every station has intrastate travel, but few of them have interstate passengers, and others only on rare occasions. If you only had interstate passengers, you would have far fewer stations

641 and the necessity for less property. If there were the same number of people and the same length of haul in each class, the only question would be as one terminal to two.

The reason the ticket sales, shown on Complt.'s Exhibits 64 and 65 are not nearer to the aggregate of the number of passengers carried, is the cash fares and mileage.

In my excess cost of 25%, I regard the possibility to exposure to accident as of the greatest importance, that, even on the South Shore, may sometimes cost as much as all your fuel costs in a year; it is among the possibilities—among the risks you take. I divided that into two kinds, possibility of accident in loading and unloading and of train accidents in transportation, the latter being ten intra and one interstate. This was due to dealing with the average length of

haul; a passenger always is exposed to accident. Every man around railroads is exposed; e. g., an engine might explode.

Q. Another one takes his place, and he is subject to accident for the 31 miles that he travels, but he is substituted for the other man, another one takes it for 31 miles, and he is subject to accident for the time that he is on the train, so, instead of being ten to one, isn't it in the exact ratio that the number of miles in the intra bears to the number of miles in the inter?

A. No, I used this illustration merely to show that it took four and a half passengers to make the length of haul of one interstate passenger, but that did not mean that there was only one inter-
642 state passenger and one intrastate passenger on there at a time. You have got 40 or 50, whatever the relation of the travel is on that train. We are dealing with that average merely to be fair, and not put it on the basis of the 85% intrastate and 15 interstate, we are putting it on the average length of the haul, as the lowest possible way it could be, about four and a half to one, we will have say ten interstate passengers on that train at the time it is wrecked, now, then, you have in your intrastate passenger, relation of four and a half intrastate to one interstate passenger exposed to injury from the derailment or collision, or whatever the character of the accident may be.

Q. For a limited time, for 31 miles, you would have your 45 passengers exposed, but you would have your ten passengers exposed four times and a half as long, because they are on the train four times and a half as long?

A. But the relation is the same, if you are going to get the same passenger miles. Passenger miles—I beg your pardon, if you are going to get your business, you can have as many times the people traveling that 31 miles as you have got passengers; you have got a relation of your passengers of 85% intrastate to 15% interstate, now, in numbers of people traveling, that is about six to one, isn't it? Your interstate passenger is exposed the whole 143 miles, but you have got the equivalent of that 143 miles exposed for every mile—in intrastate passengers for every mile that the interstate passenger is exposed.

643 That ten to one is based on the relation of the interstate haul to the intrastate haul, or, putting it the other way, the relation of the intrastate haul to the interstate haul, and that was an average. Now, in dealing with the actual condition of these intrastate trips, being made up of two, three, four and five miles, it wouldn't apply exactly to the exposure to accidents; if you were going to put it on that basis, it would be greater than four to one—it would be six to one, now, in the exposure to train accidents, I said four and a half to one, not ten to one, the ten to one was the exposure to accidents from boarding and leaving trains; the exposure to train accidents was four and a half to one.

The addition of an extra car, or 25% more equipment, to meet maximum requirement of intrastate business, would not increase all expenses in that ratio; it would the cost of car cleaning and switching, but there would be no extra employees.

The fuel cost should be equitably distributed between the load back of engine, the fuel cost would be a little more with another car added. There is no way I know of to measure the cost of this extra car, other than to divide the fuel cost equally between cars for weight behind engine. The maintenance for car wear on track would increase in the ratio of number of cars; that would be one-fourth the wear, naturally. The wear to rail by cars is slight in proportion to that of the engine. A knowledge of local conditions on South Shore might indicate additional extra costs for intrastate passenger business. My testimony applies to conditions common to all railroads. My
644 direct examination related to operating costs, except the requirement of a greater number of cars increasing the value of the property employed, upon which a return should be allowed, attributable to the freight business.

Other things being equal, density of traffic produces less cost per passenger and per passenger mile. There could not be such a difference of density, I imagine, in two parts of the road, as to materially affect the cost per passenger. As cars must be furnished to meet the maximum demand anywhere between terminals, a train might run over two divisions where the density would vary, but the train would not change the number of cars, and the expense would be relatively the same on that account. Where the trains over two divisions were separate, the density on one division over the other would not affect the cost per passenger mile, or per mile. You have a greater number of passenger miles in that train; you can spread that expense over the greater number of passengers. This 65,000 passenger miles per mile of road is the whole system.

The Master: What bearing does that have on this case, if it were more in some parts, and the cost per passenger mile were less in some parts of the road than in others?

Mr. Wykes: It has just this bearing. The places where the high cost due to scarcity of travel, exists on the South Shore are those places where the travel is more largely interstate; on the Nestoria Division, for example, where the interstate business is six times the intra, there are very few passengers, as compared with the Houghton
645 Division, for example, where the traffic is mostly of the other character, and I think it has a very great bearing on this case.

Mr. Butler: How?

Mr. Wykes: If the high cost per passenger exists on those lines that are almost exclusively devoted to interstate business, the answer is apparent how.

On the Houghton Division, there is probably a greater density of population.

Q. Then, getting back to the question of the use of property, there would be less property involved in carrying a passenger,—that is per passenger,—where the traffic was more dense, assuming values to be equal on two lines, would there not?

A. That is because there would be a greater average of passengers carried per car?

Q. Per car and per mile of line?

A. I don't know that that would be true. You would merely fill up your space that you already furnish and which is not employed, on the South Shore, according to these figures, there is room for 81 more passengers per train, on the average.

Q. Assuming that on one line those trains are nearly full, and on the other line they are nearly empty, in the one case there would be greater use of property per passenger, would there not, than in the other?

646 A. That is not necessarily self evident. That illustration I made was, and any answer to that question must come back to the proposition, that the railroad must furnish accomodations for the maximum requirements between the points between which the train runs; that would mean that the use of the property, if you base it on the number of passengers per train mile, might vary on the different parts of the line. You would use the same amount of property on the line, but you wouldn't utilize in some cases the entire potentiality of that property, and in the other you would, that is all. If now you run a train that is entirely full or the average of passengers in that train practically use the capacity of the train for carrying passengers, then you would use all of the property; that is the difference; you couldn't find a condition, probably on any railroad, where a train would have the same average passenger miles between each station all the way through, or, in other words, the average passenger mile would vary as people got on and off the train. Now, the average trains, of all the trains on the South Shore, is four and a third to four and a half cars; I couldn't say what number of cars were provided on the Houghton Division expecially as distinguished from the Western Division. It would be necessary, to answer that question, that I should know the car supply and something about the details of the travel, because I can imagine, and it is undoubtedly true, it must be an absolute certainty that the same number of passengers are not in the car between all stations between Houghton and

647 Marquette, the part of the road with the greatest density; the full capacity might be used out of Marquette, say to Ishpeming, or to Negaunee.

Q. Now, take the same proposition that you have been answering and, instead of applying it to passengers, apply it to passenger miles? Assume that there is less on one line than on the other passenger miles, then you have a greater use of property in the one case per passenger mile than you have in the other; that is self evident and that applies not only to the property in the train, but to the roadbed and everything else that is used in operating that train; that is self evident also isn't it?

A. Well, you have got to take this into consideration. You put the same amount of property in there, and you may vary the miles; you employ the same number of cars, but if you divide that now as to the use of property per passenger mile, you haven't changed the value of the property used, but if you say the value of property used per passenger mile, you have changed it; but, in the aggregate, the same value of property is used.

Q. Take those trains that you have mentioned that run 81 passengers light; that is, they would hold 81 more and seat them?

A. That is all of them, on an average, on the road.

Q. What additional costs would there be if those trains were full?

648 A. Well, there would be some additional terminal cost; there would be more tickets sold, the auditor would have to audit more tickets, and the treasurer would handle more money, which might involve employing more men. The make-up or consist of a passenger train don't differ on a railroad; it runs the same, year in and year out, unless there is something special going on at some of the towns that requires additional cars, such as fourth of July, or a baseball game, or local fair, or things of that sort, but the consist of the train is the same.

Q. The train costs wouldn't be increased, then, by increasing the number of passengers to the capacity of the trains now run?

A. Not in relation to the hauling cost, no; there might be some minor increase in expenses.

Q. A little more drinking water and a little more ice, and things of that kind, a little more wearing out on the seats and on the carpets, but only an increase in small items?

A. Well, you might have to increase your employees, probably would. You have to provide in every train to meet a number of people—in other words, you have got to be ready to serve any demand. A railroad would like to have it entirely full, and no margin. In this regular service, this regular consists of trains—that is, of cars that run from day to day, not changed,—it is based on experience that will be ready to *service* the public any day that it

649 makes a demand. It always is a little above the actual demand, because, to keep your passengers satisfied, you want to give them seats, and it ought to be done. I will put myself on record now, as a suburban traveler, that every passenger should have a seat. Now, in answering your question specifically, the consist of the passenger train being regular, the expense of handing the particular train over its run, whatever the length of the run may be, would be relatively the same; there would be some few, as I say, minor expenses due to there being more people, the maximum service being reached.

Q. If that is true, then, the fact that there may be a greater number of passengers in a particular department, an increase in one year over another in the intrastate department, the trains continuing normal and as before, should not draw to the intrastate expenses the full proportion that would be drawn by those passengers, if you consider them in comparison with the whole number? On Ex. 43, there were 18 million plus intra passenger miles and there were 14 million plus interstate passenger miles, in 1912, the intrastate passenger miles had increased approximately two million? They had increased approximately two million, to twenty. The interstate passenger miles had fallen off somewhat. Now, to carry the increased two million intrastate passenger miles did not involve the adding of their pro-

portion of the full cost of the service, because you were run-
650 ning your trains anyhow, that is true, isn't it?

A. That is probably true; it didn't increase the cost of the service—the relation—no.

Q. The total cost of running your train, of 2 to 18?

A. No, not the total cost of running your train.

Mr. Butler: That is, it wouldn't per se, it might from other conditions.

A. Yes, I mean it wouldn't, stated as you have stated it.

Q. Other things being equal, it would not?

A. No, all things being equal, that would mean that the passenger miles were the same and the conditions of operation the same.

Mr. Butler: And the haul the same?

A. The length of haul the same.

Q. Now, take on the other hand, assuming the trains were run solely for the interstate business, and the interstate passenger miles decreased from 14 million to 11 million; that would not decrease the train expense in the ratio that those figures bear to each other, would it?

A. Not if the conditions of train miles and all other things were equal.

Q. But if, instead of the trains of the South Shore running with 81 vacant sittings, on an average, they ran with 100 vacant seats, on an average?

A. You are not decreasing the cost at all, that cost is the same, as long as you remain on the ready to serve basis. Four and
651 a half passengers would have to travel 31 miles each to accomplish the same mileage as accomplished with one passenger in interstate; that would be on the relation of 9 to 1. There might and might not be train stops for these passengers in the relation of 9 to 1, or of 4½ to 1. There would be that many terminal expenses in one service as to the other. As to the train stopping, that might be somewhat different; it might be greater or less.

If only one passenger got off and on at a stop, it would work out on the same relation for stops. The local trains I took, stopped at practically every station, with some flag stops. I was on a purely local train, Bibon to Nestoria; the interstate passengers that were on from Bibon gradually thinned out, and people going to Marquette, Houghton, etc., began to get on. Trains 7 and 8 make stops in addition to those scheduled, generally, for passengers beyond the state line, west. I think I figured those in, in arriving at the number of stops; I am not sure. I naturally would have taken all of the probable stops. With mileage in Michigan of 143 miles, if all trains were interstate, there should be some difference between them in speed; this could be accomplished by a fewer number of stops, or by making it a faster train. In looking over the trains on South Shore I find very little difference in their speed; 7 and 8 accomplish the time between terminals at two miles per hour greater speed that the others. Assuming this road was doing only intrastate business, there should be some trains that would be run for the smaller towns,

and stop at all the stations, perhaps, and others which would afford means of communication between the places; that would de-
652 pend upon the demand. It is natural that provision should be made for a through service more quickly than a local service; a railroad measures that by public demand, as expressed in the travel.

Trains 7 and 8 answer at least two purposes, the rapid transportation between the larger cities, and for the interstate traffic as well; they carry a great many interstate passengers. Where the capacity of a train is measured by the greater volume of business between two stations, both the interstate passengers who are on it and the intra who travel between those points would contribute to making it full, and the relation in numbers is such that the spaces being used for short distances shows it is short journeys that makes that space necessary. As a general proposition in railway operation, you can figure closely how many cars you want each day for long hauls; with short haul passengers, that is very difficult; you must be ready to meet any emergency. For special occasions, such as a ball game, if the accom-odations provided would not take care of them, they would put on an extra car for that trip; they would not carry accom-odations throughout the year to answer the needs of extra travel for such purposes; but something comes up every day, somewhere on the line, they must be ready to serve.

I found three passenger carrying cars on the average train, some of them being cafe observation cars, with 15 seats, or a sleeper, ordinarily, you would have a smoker, one coach and cafe or dinning car, or a sleeper, and that, whether there would be 10 or 25 people to use it, and a parlor car, or cafe car, or diner, or sleeper.
653 I don't know as I would dispense with any of those cars if the traffic were lighter between some points on the South Shore. I think the cafe cars on 1 and 2 had a greater number of intrastate passengers; I could not say how it was in proportion to the number of passengers in each class. I didn't analyze that train closely, but formed conclusions as an incident of my journey.

Other things being equal, there would not be many of the passengers traveling 31 plus miles or less who would pay the extra fare for accom-odations in the chair car; you can get a pretty long haul on the South Shore as an intrastate passenger. There are a good many of the passengers at 31 miles or less to bring the average down to 31 plus. As a general proposition, the special service provided by the sleeper and parlor car would be more used by the person receiving the longer haul; it might be an intrastate haul. There is a good deal of high class travel between Marquette and Detroit and other cities in Michigan, which would use those accom-odations. The interstate travel alone would not support it. The South Shore runs a sleeper from St. Ignace to Houghton and return, probably for the intrastate passengers. The day I was on the train, we had a greater number of passengers between Houghton and Marquette on No. 1 than elsewhere on the line. On train 7, I went through the train to observe condition of operation, and that had considerably more from Marquette to Ishpeming than west of there; it would be natural

that travel would be heaviest between Marquette and Houghton.

654 Assuming the travel to be such as it was on the day I was on the train, I do not think I should have dispensed with any of those cars, you could not very well dispense with any but the observation car. I would not have cut off any of those cars after traveling over the road, if I were managing; it seems to accom-odate and please the people. The dining car and cafe car on South Shore is as good as on anybody's road; better railroads than this do not have any better dining car service; it compares favorably with those found on other roads, and no man from New York to California could complain of it.

In Minnesota Rate Case, my testimony was directed chiefly to freight; the conditions influencing excess cost of intrastate over interstate service might vary with different roads with a lot of branch lines. The extra cost would be higher for the road with the branch lines, and my impession is, that in Minnesota case I put it as high as 40%; I don't believe in any case it could run lower than 25%.

The day trains naturally carry more local traffic; as a general proposition, the night train would be preferred by interstate traffic; possibilities of long intrastate hauls are great on South Shore, because there will be considerable travel to Southern Michigan points.

I have, more or less, for 15 years, investigated to determine the exact cost of carrying passengers; I have worked it out, and then given it up, and tried it — every angle that could be worked. I gave it up because I did not get truthful results; anyway it could

655 be worked, it would come, after all, to so much depending upon observation, that could not be demonstrated mathematically, that you might use it to serve certain purposes of the railway, but, take it outside the railway sphere, and they would ask you to prove it. I am still at it, and have not solved the problem yet. It would vary according to conditions on the road, and results worked out for one road would not necessarily apply to another.

Even on the particular road that I am connected with, I am unable to get exact costs; I am not able to demonstrate it mathematically, but have them sufficient for use for statistical purposes—not sufficient to satisfy myself that I have got exact results. In discussing it with other men working toward the same end, you find that you have got where they have and there you are stuck; they have all got to the same basis, and you cannot get away from it.

I never made computations to determine the cost of terminals per passenger, or reached any mathematically correct results for that, because the impossibility of determining that definitely is obvious.

Q. And when you did get the cost, in the general way that you have stated, of carrying passengers, that was based on arbitrary premises throughout, was it not?

A. You might term it arbitrary, if you would say that anything that is not mathematically justified is arbitrary, but your result will be closer than anybody else could get who hadn't the experience to make deductions from their observation to consider in connection with their problem.

656 I should say that "estimated" would be a better word than "arbitrary." The division of costs calls for the application of judgment in the division of items from point to point, and would depend largely on the observation and experience of the man making the estimate. I am not testifying as to the unit cost of carrying passengers. Unit costs are very difficult; you might obtain a very few on a railroad, as compared with some other kind of business. When you divide the costs of a stop at which you deposit 10 passengers, nine of whom are intrastate and one interstate, on the basis of nine to one, that does not attribute the exact cost of each of the different classes; it would not be a problem that any man would undertake, except, perhaps, for a purpose like this. The cost would probably not be much more for depositing six than one, except as to some of the elements entering into it. In the nine passengers, there are nine exposures to risk of accident, intrastate to one interstate. The stoppage cost might be a little greater because it would consume a little more time.

Q. You would attribute the cost on the basis of nine to one, on your idea of that's being a fair method of separating that cost?

A. Yes, if you are going to divide that cost. I should say that the benefits are nine times to the intrastate to one interstate. The natural definitions of the word there would be if the benefit is conferred by a railroad it is all attended by cost.

657 In testifying to the use of the revenue train mile basis for division of common expenses, I testified that the additional speed in the passenger department would not, of itself, offset the extra weight in freight service; there are other elements which would come in. I limit my answer, that the revenue basis could be applied to the division of general expenses to the division between states.

I stated that the element of speed in passenger trains might not of itself overcome the greater weight and number of car wheels of the freight train, because it was a matter of uncertainty; one would not want to make a positive conclusion on any one particular element, or its importance as to the balance, or as to the whole. The weight and speed would have to be taken into consideration; also the limitations of the construction of the property for the passenger service, because to construct the property at the maximum, would increase cost of freight train operation.

If it was a question merely of weight or speed, all other things being equal, I would say that that, of itself, would not be sufficient; as to the effect of operating a heavier train at a low speed over a track constructed for high speed, I believe it would be a proper consideration to make one the equivalent of the other.

That element was the elevation of the outer rail on curves, and the broadening of the gauge, to meet the speed of the faster moving passenger trains, also the passenger train being

658 preferred, and the freight obliged to take the sidetrack in meeting and passing, wears switches and frogs.

I might have pointed out other elements to offset greater freight weights in my direct testimony that would have related to the grand account of maintenance of way and structures, but these are all I

can call to mind at present; those would appear in the maintenance of way account in rails, track material, ties, roadway and track and roadway stores and supplies. The ultimate strain of centrifugal force varies in proportion to the weight and motion. The engineers have a formula something like the square of velocity; I don't think there could be any doubt about the fact that centrifugal force would be greater with greater weight. The chart, (Complt.'s Ex. 63), indicating delay of freight trains due to passenger trains is for Houghton Division only. Conditions are not necessarily the same on all three divisions. The traffic is heavier on Houghton Division; I selected it because it was the shortest mileage, and I could get it done quickest. It is obvious that the greater the number of trains, the more meetings and the more delays. The meeting places are shown on the chart; these scheduled meetings are to get the passenger train by the freight train, and to get the freight train by the passenger train, on a single track.

It is requisite that a freight train pass the passenger train as much as that the passenger train pass the freight train; the only thing is that a freight train takes the sidetrack and waits for the
659 passenger train's arrival; the passenger trains do not have to wait. If you are running passenger trains 35 to 40 miles an hour, I would not take chances on less than 30 miles ahead of the passenger train; it would be different for a train running 22 to 24 miles an hour. On the time card, freight trains are scheduled closer than 30 miles an hour; that is a matter of arrangement. The 30 miles an hour refers to when the schedules are disarranged; the train dispatcher then takes charge, and handles the train and directs the meeting points. He would have to take into consideration the train on schedule to the extent that he must provide for safety.

Q. You- allowance of 30 miles is not an allowance for two trains on schedule, with a schedule meeting point, it is an allowance for a stray train, or a train running off schedule, as against either one on the schedule or another stray train, is it not?

A. So far as a regular orderly operation is concerned, by schedule it would be both before and behind the train, but in the disarranged schedule, it would of necessity be greater. I illustrated that in two passenger trains coming to a meeting point themselves, and there is a freight train in there; that freight train is bound to get a bad delay, unless it is exactly arranged and the actual schedule is carried out, because, if she gets into a sidetrack to allow one train to meet her, she cannot go any further perhaps in a thirty mile distance between those two passenger trains approaching each other, the dis-
660 tance 30 miles, and get anywhere else until the other train had met her, one had passed her, and the other had met her, or vice versa. In approaching each other, a schedule might be made 15 or 16 miles apart with a freight train, that a freight train could get a movement of some sort for a very short distance. You must consider the time necessary to stop the train, to permit the brakeman to get ahead and throw the switch, then for pulling in on a passing track, around something of a curve, all of which takes time.

The time varies, I have seen a heavy freight train take 10 min-

utes to get on to a passing track; they might be able to pull in in five or six; the average would be seven or eight minutes. Railroads require a freight train to be clear of the passenger train by at least five minutes. Under normal conditions, the locomotive, in getting a start and the use of the sand, would cause wear on the track; in bad weather, with dew or water on the rail, it might cause greater wear. It would not cause as much wear and damage to track as would be done on curves or on grades.

After the passenger train has passed, the freight train is free to operate, but, as passenger runs at double the speed of freight, it necessarily leaves an opening there; it is ready for the freight train to go on to it as soon as the passenger train has passed the limit by rules preventing freight trains leaving stations following passenger, which may be within five or ten minutes; it differs on different
661 roads and at different stations, due to topography of track.

There is some service performed by passenger trains for common operation of property; the baggage cars are utilized for moving material that requires quick movement, and for stores, supplies and stationery. Company employees will be transported on passenger trains, and passenger trains would carry company mail; that, so far as it goes, is an offset in service, but the freight train service is very expensive, because carrying much tonnage of company fuel.

The business carried on passenger trains would be comparable with that bearing high rates; it would be carried in the same cars with express, and handled often by the same joint messenger and baggageman, but the volume of company material handled on freight trains is very great, including freight, ties, ballast, rail, track material, timber, lumber etc. On the other hand, the number of persons carried free for service or exchange of service is quite large.

You don't have to furnish additional cars to carry stationery and company passengers, you have to furnish both cars and, sometimes, extra trains for bulk of company freight carried. I think the number of cars given passenger trains would run about the same throughout the year.

I think I testified in C. P. & St. L. case—the Illinois case—that revenue train mile basis was to be applied generally as to all expenses common to both, unallocated to either, without going into separate items; I made no figures for the purpose of that division.

662 My recollection is that, in the Arkansas Case, the division of common expenses between passenger and freight was substantially the same as Complt.'s Ex. 41. In Arkansas Case, we used a different formula for station employees, being an arbitrary division of 75% freight and 25% passenger on unallocated items, due to peculiar conditions.

The same basis for the division of common expense was used in Missouri Case as in Arkansas Case, we presented one basis, the State another, and the Judge divided on his basis; in Missouri, our basis was accepted by the State.

Both Missouri and Arkansas cases comprehended both passenger and freight rates.

In Arkansas and Missouri cases, we divided items which are comprehended on sheet 2 Complt.'s Ex. 41 Delf, on basis of 10% to passenger and 90% to freight, by using what we actually found to be the case, by making observations and determining it in hours devoted to the two classes of work; we reached a conclusion of 5% passenger and 95% freight for each state. Our yard arrangements were especially favorable, and, with rare exception, our switch engines were able to perform the freight and passenger duties.

There were a great many different terminals and different conditions comprehended in the system involved in both those rate cases, the Missouri Pacific, involving 1,400 to 1,500 miles and the Arkansas Case close to 1,400, not including second track. In Arkansas Case, the issues were tried for two railroads, and in
663 Missouri Case there were 18 different systems.

I would not want to testify positively that the ratio of 5 and 95 was used for all the railroads involved, but for our company it was taken from our own test for about a week. We still carry that figure on our operating sheets. I don't know why it should be different in this case; it would depend on local conditions.

Q. The freight train mile is not the relative or the equal of the passenger train mile, is it; they are not the same thing, in other words?

A. Of course, no man could testify that they were exact expense equivalents, but, in considering their direct expense and those that followed because of the limitations placed upon the freight trains, railroad men who have given the question consideration have generally agreed that that is the fairest factor to use, and they have used it for their own purposes. Railroad men might differ individually as to how they reach a conclusion, how much value they gave to these certain elements, but they get to the same place, they all get to the fact that it is the best unit that can be employed, it gets nearer the truth. Of course, if there was any better unit, they would be glad to get it.

Q. They don't all agree on that, do they?

A. They all agree on the general conclusion.

Q. That the revenue train miles basis is the best unit, is
664 that the concensus of opinion among accountants and engineers, in your judgment?

A. I won't say among accountants, I will say among operating men; you might find railroad accountants that might differ on that, because you can get up an argument on anything on a railroad, but I believe that accountants generally, and I know, practical railroad operating men, regard that as the closest unit to employ.

Q. There have been a great many accountants who have taken a different view of it, have they not, and a different view and method has been employed in the division of common expenses in cases other than these mentioned, but which you are in general familiar with?

A. Well, in the evolution of the railroad mind, pretty near every unit that is possible, or combination of units, has been employed, in an effort to get an exact result, and they have been discarded, as well as has the arbitrary division that the Interstate Commerce Commis-

sion first directed be made, they have all been discarded. Now, with the accountants, they have got a limited field for considering that question; the accountants can determine and allocate their expenses from their books; when they come to the matter of common expenses and where their book entries no longer prove to be a guide, their examination has got to stop, and they have got to consider items that cannot be a matter of accounting record. You must go in the field of cause and effect; you must consider further the practices of operation; and those are all matters that the accountant would have no opportunity to consider in the matter, and which are, after all the essentials.

665 He has no guide in his books; the common expenses must be determined on the basis of the known effects, which can only be learned by observation, experience, and the putting of all these things together. That is the reason I said a moment ago that railroad men might not agree in the detail, or the value of the various details, but they came to the same conclusion that the passenger and train mile were practically equivalents, or sufficiently so to be used as units, and give the closest determination of the expenses. Now, in making the efficiency sheets, I know of no road that don't employ that method of division; those efficiency sheets the management is testing itself, and is comparing itself, its efficiency with the efficiency with other railroads, the efficiency of the particular divisions, which of course, would reflect on the superintendence; it is tested in that way.

Q. But for those purposes relative costs are sufficient?

A. No, because one of the very first essentials, is to divide your passenger and freight expense; before you can take a step in the preparation of your operating sheets, you must determine that. Now, if there was any better unit in the mind of men upon which they are going to measure their own effort, they would very naturally adopt it.

Q. The dividing of these common expenses on the basis of revenue train mileage for statistical purposes, was used long before the necessity for its use in railroad rate cases came into existence?

666 A. Yes, sir, it was the standard.

In my mind, the doubt is whether the freight train mile is the equivalent of the passenger train mile—whether the passenger train mile is really most expensive. At a certain time of the year, in bad weather, while the freight train mile appears more expensive, it is because of passenger trains. I have known of an operation six weeks at a time when it was almost impossible to get a freight train over the road because all the activities of the organization were getting the passenger trains through.

Upon the question of whether the revenue train mile basis is fair for dividing costs that don't occur on the line where the mileage is made, but which occur on branches where one class of the service is not carried at all, a railroad won't go to the expense of creating any unnecessary facilities for its operation and any of those facilities for the common benefit of both classes of traffic; if it didn't have that track, whatever it is, that is used by the freight, that business would

have to be done on the main track. You either have to create a facility or do the business on your main track, in some manner.

Q. How does it relieve your main track, if you didn't build out five, six, seven or eight miles to get it, it wouldn't be there?

667 A. You have your railroad for the transportation of your passengers and freight, and you have your passing track, to enable those trains to be met and passed, and you have your house tracks and your freight house to enable you to handle the merchandise, and you have your public team tracks on which you can receive and deliver carload freight, and you have your tracks to the stock yards and then you have your tracks to industries; now, all those facilities are necessary to enable you to do business, and the business you get from their employment gives you your revenue, and business. The employment of any independent tracks for one kind of business or another is merely incidental, and not fundamental. The idea is that your revenue which goes to pay your whole operating expenses and your cost of operation, which is produced by those facilities, is the point of direct consideration in this question. You might as well say that you should eliminate your stock yard tracks and your house tracks and everything on a railroad except main track and the passing tracks.

Q. But those particular things, if you can find where the item of expense on their account is, you will locate it directly, won't you, to your freight?

A. That would be merely the first view of the question. The question is that these facilities are all necessary to enable your business to be done, and, as I said before, in the question of division between passenger and freight expenses, if you consider that on a narrow ground, you would say I will allocate these; when you do, what are you going to do with the revenue produced?

668 Q. So far as you can determine the income of those things absolutely as being of that character, you locate them in the freight side of your problem, don't you?

A. They appear in your freight earnings and in your passenger earnings. As I understand it, you have merely taken certain tracks which are used for freight business solely, and you say this should not be considered in your general division of your expenses. Why don't you on the same basis, eliminate all of your house tracks, and your stock yard tracks, and, as I said before, eliminate all tracks except those that are necessarily for those trains, to enable the conduct of train operation over the road, your passing tracks.

Q. The reason you don't do that is because you are not able to separate and allocate the costs of those things that lie along the main line; so far as you can locate them, you have done it before you have come to the question of what are common expenses, and you are getting at the basis of division of those things that are common after you have set aside those that you know belong to one class of the service or the other?

A. I see no more reason for eliminating any tracks that produce one kind of revenue from consideration here than all tracks that produce that same kind of revenue, and that would take in your yards,

in fact, there is no more justification to my mind, in eliminating any of those independent tracks; that is to say, tracks, just skin
669 the railroad down, undress it, if you please, down to the main track and the passing tracks; they are all necessary to its operation, and at times they might possibly be used; but the whole result comes down to this: In building your freight tracks for freight, you are increasing your freight tonnage, aren't you, and you are increasing your freight revenue? Now, when you get a total, because of the rates existing today, may be in just proportion to each other, but if you increase your freight, increase passenger, you are enabling the road to conduct the business of either without going into the hands of a receiver, or both, you might reduce the rates on one class of business below a living basis; still you might keep out of the hands of a receiver, if you were able to build into a lot of industries and get a whole lot of freight business.

Q. That is really a question of economics you are talking about now and not the question of getting at the division of costs of business. Now, you have stated that the building out of these spurs increases freight revenue?

A. Yes.

Q. If they are used solely for freight purposes, that freight revenue of that part of the business should bear its own expenses, shouldn't it?

A. Doesn't it reduce the cost of your passenger?

Q. Just answer my question, as to whether the freight business should bear its own expenses?

A. The freight business should bear its own expenses, but
670 where you come to a question of interjecting in there a property value to be deducted before you divide either your revenue or your operating expenses, it seems to me you are trying to solve a question on one or two of its factors, and not employ all of them.

Q. I am not trying to get the property value in.

A. As I understand it, it is the value of this track; here is an independent facility, you say the operating expenses of that independent facility should be charged to freight, is that it?

Q. Take, for example, the Republic branch, that the Master spoke about, and eliminate from it the consideration that one passenger train passes over it; assume that it is entirely engaged in freight service, and you can find, either exactly or arbitrarily the cost of operating over that line of eight miles, should that not be directly allocated to the freight service?

A. No. You have got your other side of this question to consider, as you increase your freight business, you are decreasing your passenger expense in common items.

Q. How?

A. Because you are making more freight revenue train miles to handle your increased freight business.

Q. Where are you making it, on the main line or on this spur?

A. You are making it as a whole, altogether.

671 Q. Making it on the spur, too, I assume?

A. I don't know, but my impression is that there is no revenue derived to a railroad from the spurs, that the rates at the junction of the spur with the main track are the same as from the end of the spur—the end more remote from the track. If your freight business increases, however you increase it, that causes you to make an increase in your freight train miles, you are reducing your passenger proportion of the cost.

Q. Let us admit that to be true for the moment. Assume the operation on this spur is entirely freight operation; there is no passenger operation at all; it costs money to operate it. Now, what business produces the cost? Is it the freight operation on that spur, or is it the passenger operation on some other part of the line?

A. There may be there, if it can be allocated a direct cost, that is apparently freight, but what is the effect of it; doesn't it help to decrease your passenger expenses?

Q. That may be true, but the freight operation produces the cost, doesn't it? I would like to have you answer that by yes or no, if you can.

A. I should say, directly, yes, assigned to that particular piece of track, but, as against that, you haven't any revenue from either department.

Q. Now, if we treat that as common expense, and divide it on the basis of the revenue train miles, a part of that expense goes into the passenger expense, does it not?

A. Yes.

672 Q. And that will be in the proportion that the revenue train miles in one department bears to those in the other, those costs or expenses that are due to maintenance that is caused by deterioration or age rather than wear, what relation have those to train movement?

A. The whole of the railroad, in all of its activities, is devoted to only one thing, that is the movement of trains, and anything incidental to that road that is necessary to keep up, regardless of how it was caused, bears its relation to the operation of the trains, because that is all the railroad was built for.

The wear by age goes on, whether you move any trains in passenger department or not, but the only activity of a railroad is its train operation. If next year you move only half as many trains on the South Shore in the passenger department, and the same number in the freight department, the same amount of deterioration, age and cost of maintenance due to that would exist, and, using the train mile basis as the basis, you would only draw half as much to the passenger department as in the previous year; or you could reverse conditions, and draw half as much to the freight department. You could make any proposition, and get a conclusion from it, but these are not conditions that would in any probability ever arise. Year by year, the relation of your passenger and freight train miles will be very close; there may be some special occasion that would change that relation.

The tendency is growing to larger locomotives and longer freight trains, which involves less freight train miles. The substi-

673 tution of different types of locomotives, that will draw three to five cars more in freight service, will materially affect the number of freight train miles. The heavier units make greater cost of maintenance; most of any of these railroads 20 or 25 years ago would not stand the traffic of today, 56 pound rail was once considered good track but today we want 80 to 100, which is occasioned by the weight of the units just referred to; the bridges are constructed to bear more than double the weight. The increase in the size of cars and locomotives creates a much greater expense in operation.

The primary purpose is to decrease costs, and even that result in handling freight business serves to decrease the cost of handling passenger business. There is not much difference between the weight of present day freight locomotives and the larger passenger locomotives. The number of cars drawn by a passenger train has not increased in the ratio with the number drawn by a freight train, as weights of those are considerably different. They began to use this revenue train mile basis a good many years ago.

I don't know that there is any increase in number of cars per train over a number of years ago, but there is in the number of tons per train. We don't use the number of cars in a train any more as representing freight statistics; it is disregarded, we deal altogether with gross and net tonnage, today, per train mile.

Referring to the question of whether I had made any investigation to determine what part of wear on curve is due to
674 elevation and what part is due to the fact that trucks of freight cars do not adjust themselves to the track as readily as passenger trucks, it is a fact that the freight truck is not calculated to meet that condition that the track is elevated for. It is not a matter of speed, the freight track answered the purpose for freight transportation. If there were no elevation, there might be some wear due to freight trains on curves, but it would not be so much. I never made any investigation to determine the proportion of wear due to restoration of the train line after passing the curve, where there was not any elevation, and due to elevation of the outside rail; that can only be observed in yards; on the line you have both elevation and curve. I attribute great wear on curves to the elevation of the outer rail.

There would be some elevation for a freight train speed, you know, and whatever wear was caused on a track that was adjusted for the freight train business on the curve would undoubtedly take place; it would take place, however, in a lesser degree. I have never investigated those two separate things to determine what proportion of the wear one causes and what proportion the other causes.

675 On April 22, 1913.

NELSON CADARETTE, a witness called by plaintiff.

Direct examination.

By Mr. Butler:

I am Assistant Engineer of plaintiff; I have been in that company's engineering department since Nov., 1891. My work has been particularly in maintenance of way and buildings; I have been over the line a great deal and am familiar with its location, lands used for railroad purposes, records, charts and maps, the latter being kept under my direction.

I furnished Mr. Riggs the records, maps, charts and other information referred to in his testimony. I furnished him Complt.'s Ex. 2, Riggs, condensed profile, horizontal scale, 5,000 feet to inch; vertical scale 100 feet to inch; Complt.'s Ex. 3, Riggs, blue print map of Soo terminal, scale 150 feet to inch; Complt.'s Ex. 4, Riggs, St. Ignace terminals 200 feet to inch, Complt.'s Ex. 5, Riggs, small map, Marquette and vicinity, scale 2,000 feet to inch, Complt.'s Ex. 6, Riggs, map of Marquette, scale 200 feet to inch; Complt.'s Ex. 7, Riggs, map of north Marquette, 200 feet to inch; Complt.'s Ex. 8, Riggs, Map of Negaunee mining district, 1,000 feet to inch; Complt.'s Ex. 9, Riggs, Map of Humboldt yard, 100 feet to inch, Complainant's Exhibits 10, Riggs and 10*a* Campbell, map of L'Anse, 100 feet to inch; Complt.'s Ex. 14, Riggs, sample page of track record, Complt.'s Ex. 15, Riggs, map of right of way Negaunee and Ishpeming, 400 feet to inch; Complt.'s Ex. 16, Riggs, map of D. S. S. & A., Houghton yard, scale 50 feet to inch; Complt.'s Ex. 19, Mason, map
of Baraga yards, scale 100 feet to inch; Complt.'s Ex. 20,
676 Hutula, map of Covington town site, scale 100 feet to inch;
Complt.'s Ex. 21, Wallen, map of Ewen yard, 100 feet to inch; Complt.'s Ex. 22, Hamar, Chassell, 100 feet to inch; Complt.'s Ex. 23, Oakley, another map of Covington, used by E. W. Allen, in his testimony and Complt.'s Ex. 24, Kunze map Sidnaw, 100 feet to inch. All these maps are from original records, or from re-surveys in my office, and show correctly what they purport to show.

I gave Mr. Hansel and his assistant full and free access to all the records of engineer's department, including bridge and other records I have referred to; they used the same freely.

On January 27, 1914.

CADARETTE recalled.

Further direct examination.

By Mr. Eldredge:

The principal use of the heating apparatus at the Soo is to heat passenger coaches in the yard; also, the passenger station and freight

house office (14 feet x 20 feet) are heated from the same house. I think there are four small radiators in the freight office, and that not more than .5% of the steam created in the plant is used in heating that office. With that exception, the heating apparatus is used entirely in passenger service.

The wye at the Soo, allocated to exclusive passenger business, is not used for freight locomotives.

The combination freight and passenger station at Brimley 204 square feet, is used for exclusive freight, 276 square feet is
677 agent's and telegraph operators' room, and 320 square feet for waiting room.

The waiting room at Wellsburg is 210 square feet and telegraph office 81 square feet.

At Strongs the waiting room is 256 square feet and office 128 square feet; replaced with new buildings since 1913. The freight was formerly kept in an old box car body, allocated to freight.

At Soo Jct. waiting room is 576 square feet and office 144 square feet, freight room 360 square feet; the office is used for joint freight and passenger, and over the men's waiting room of 288 square feet and the office of 144 square feet are rooms occupied by the agent as living rooms.

At Eckerman the waiting room is 192 square feet and office 192 square feet, the office is used as telegraph and ticket office combined.

At Newberry the office in passenger station is 320 square feet; the office is the only part of the station I would not call exclusive passenger; the agent has his telegraph and express office there.

The agent spends most of his time in the office, in passenger station; I cannot say whether he has an office in the freight building; he probably transacts some freight business in the passenger depot, as the trainmen get their orders and things of that kind there. Assuming he does all his freight business there, about one-half the office should be allocated to freight. He has to spend a good deal of his time making out his way bills and abstract, and one thing and another, and, I think, equally as much time selling and keep-
678 ing account of tickets.

At Seney the office is 150 square feet and waiting room 225 square feet; the office is used for selling tickets, taking care of freight business locally, giving train orders, a small amount of express business, and such commercial telegraph business as there is.

At Wetmore the office is 150 square feet and waiting room 225 square feet; second story is used as agent's dwelling.

At St. Ignace, the passenger station is exclusively used for passenger business; the freight office is in another building, the agent spending some time in both places; I think they have a telegraph operator at both offices.

At Marquette, 3,325 feet of the first floor is devoted to exclusive passenger; 350 feet occupied by entrance to second floor is devoted to common; the second floor contains 3,675 square feet, used for offices of General Superintendent, Assistant Superintendent, Roadmasters, Train Dispatchers and General Superintendents' clerks. 525 square feet would be occupied by train dispatchers; we have no

dispatchers at Thomaston, and all main line dispatching is done from this office; 150 square feet is occupied by Assistant Superintendent, whose duties are confined to Michigan; 200 square feet is devoted to chart room, where time tables are prepared; and 525 square feet by Car Accountant; the basement is occupied by heating plant, used for heating the building and the cars standing in the yard; 90% of the heat goes for the cars. In view of the fact that there must be a passenger station there, and that that passen-
679 ger station would require a roof, I should say one-third the value of the building should go to the upper part and two thirds to the passenger business.

At Negaunee the building stands on South Shore land, and is owned jointly by C. & N. W. and D. S. S. & A.; there is no use except for passenger and express.

At North Ishpeming there is no use except for passenger, express and telegraph office; the freight office is in the freight building; just one desk with instruments on it, 18 or 20 square feet is occupied by telegraph. Except the use by telegraph operator, if used for giving train orders, the use is exclusive passenger.

At Champion the passenger station contains two waiting rooms, 432 square feet and 288 square feet lunch room, 240 square feet and office, including telegraph and express office, the same as at other similar stations, 240 square feet. The agent has an office in freight station, for freight business but there is no telegraph office there. One-half the passenger station belongs to St. Paul road, and one-half to D. S. S. & A.; the space occupied by the two companies' Telegraph offices is 240 square feet. 15 or 18 square feet of office space is occupied by telegraph—just enough for a desk. The express office is a separate building. Except for telegraphing, the Champion station is used in exclusive passenger.

At Nestoria the passenger business contains two waiting, a lunch, baggage and office rooms; the office is used for ticket sales, train orders, and Nestoria freight business. The office occupies
680 240 square feet.

At Lake Gogebic, the dining hall, since spring of 1913 is used as a residence by South Shore agent.

At Thomaston the station contains waiting room, 410 square feet, lunch room, 399 square feet, office, 252 square feet and second floor, contains 252 square feet, used by Assistant Superintendent, when at Thomaston over night. Assuming upper portion joint freight and passenger, and excluding office, 25% of the building ought to be common; the office is used for telegraph, freight, selling tickets and in part by Assistant Superintendent as office when he happens to be there.

CADARETTE.

Recross-examination.

By Mr. Wykes:

At Brimley station the office is entered through the waiting room; if you went there to send a telegram, or had freight business with

that office, or took an express package for shipment, you would use the waiting room, and must use it to make any one of those uses of the offices.

That same thing is true at Wellsburg.

Wellsburg has a population of 10 or 12—the section foreman, his crew and the children—both passenger and freight trains would receive orders from that station.

At Strongs the same use would be made of the waiting room as at Brimley and Wellsburg.

681 That is true of practically all the places where the office bears a common use, or a partial freight use. There is no other way of getting into the office, except through the waiting room in most of those stations; a person doing a freight business with these offices uses the waiting room to get in and out, and for waiting around for receipts, bills, etc. There is the same use of the Newberry passenger station waiting room for such freight business as is done in the office there.

The agents occupy living rooms on the second floor of passenger stations at L'Anse, Covington, Paynesville and Keweenaw Bay; notwithstanding this use, stations containing rooms so used have been, in Complt.'s Ex. 1*a*, Riggs, assigned to passenger service. Where the living rooms of employes were in a separate building, that building has been assigned to common, as a rule. I should say practically the entire second floor of the Marquette station is in common service.

CADARETTE.

Redirect examination.

By Mr. Eldredge:

Trout Lake, in my judgment, 20% of the building should be assigned to the second story, used as living room for the agent. I think in those cases where buildings contain living rooms upstairs there should be a little more detail as to the allocation than Complt.'s Ex. 1*a*, Riggs, contains.

At Soo Jct. part of the second floor is a living room, and 20% of the building should be so assigned. At Wetmore one-third of the building should be assigned to the second floor use for living rooms and the same at L'Anse, Humboldt, Keweenaw Bay and

682 Paynesville. At Covington, the living rooms on second floor occupy but part of the building, and 20% of the total should be assigned to the living rooms. At each of those buildings where there is no upper floor, the station would still be required and must have a roof.

The portions fixed of parts used as living room were proportioned of entire building, and the same percentages would prevail applied to value as for space.

CADARETTE.

Recross-examination.

By Mr. Wykes:

I say one-third the Humboldt station is used by second story, on theory that you must have the roof, the foundation and two-thirds of the wall and material, anyhow. I simply place the extra amount that is added in buildings having a second story to the use to which the second story is put. The second story needs every part of the foundation, and the roof; we have provided, in instances, living rooms for agents or employees not in station.

CADARETTE.

Redirect examination.

By Mr. Eldredge:

I went over the line in July, 1913, and checked by actual measurement the dimensions of all stations and other structures, and their use, and correctly reported the dimensions to Mr. Riggs. I have examined Complt.'s Ex. 1*a*, Riggs, as to the items of station buildings and fixtures, shops, enginehouses and turntables, water stations, fuel stations, warehouses, docks and wharves, and miscellaneous
683 structures, and find that Mr. Riggs has used the dimensions and figures correctly, upon the information that I gave him; the mistakes of Mr. Riggs were mistakes in allocation and not in description.

CADARETTE.

Recross-examination.

By Mr. Wykes:

The office in the passenger station at Seney is used by the agent having charge of both freight and passenger business there, and for the telegraph instruments. I testified with regard to one station, that persons going to see the agent on freight business would, of necessity, have to go through and stand in the waiting room while they were talking with the agent or waiting for him, even though they went to see him on freight business. That is true in practically all these cases where there is an office for the use of a common employee in a station building; that is, that the persons who go to see him would go to see him at that office, and use the waiting room for that purpose, and to wait for him; this is the general rule.

St. Ignace station is used in telegraphing; the same for downstairs of Marquette station.

The cost of ticklers, omitted from Riggs' appraisal, wouldn't be less than $15 or $20 each. There are two or three around Mar-

quette; there are a number of others on the line; I cannot locate them; they would be where there is an overhead obstruction which we have around the iron mines, and in some cases at saw mills.
684 I don't know of any on main line; those at Marquette are on freight tracks.

CADARETTE.

Redirect examination.

By Mr. Eldredge:

The actual cost of bridge 94D was $18,830, at which it was included in Riggs' inventory.

CADARETTE.

Recross-examination.

By Mr. Wykes:

This is the gross charge, and includes loading and unloading of material, and does not include transportation of many items, percentage for use of tools, or overhead costs; just the actual costs of labor and material is kept track of.

The ballast record of the South Shore has been kept since 1891. From that record, I have prepared a table stating the condition of main line track, Dec. 31, 1891, and the amount of ballast of the different kinds at that time and that added since for each year, to June 30, 1913. I also show an estimated amount added for the balance of the calendar year 1913. For each year, 1892 to 1912 inclusive, the period is by calendar years, and in addition I show the condition of track, June 30, 1913, with the mileage of ballast of each different kind. The 50.7 miles is for the calendar year 1912. A portion of the ballast of late years has been carried in regular revenue trains of the company; some of that has been done in every year. Where the ballast is hauled in revenue trains, the haulage cost would not appear in the charges against ballasting.

(The statement prepared by the witness is as follows:)

Record of Ballast in Michigan (in Miles).

Condition of track.	Fine sand.	Sand and gravel.	Gravel.	St. Ignace gravel.	Mine waste.	Stamp sand.	Cinders.	Total miles.

6846 On May 5, 1914.

CADARETTE recalled.

Further cross-examination.

By Mr. Wykes:

I have prepared a list of the culverts, to indicate the changes made in culverts between June 30, 1911, and June 30, 1913, including both those due to changes in appraisal and changes by replacements. That furnishes the details of the changes in culverts on pages 28 and following of Complt.'s Ex. 1*a*, Riggs. The information I have prepared is as follows:

73 old wooden box culverts found in 1913 to be caved in and abandoned as waterways and called filled in the 1913 appraisal. No date of abandonment.

26 old wooden box culverts replaced with cast iron pipe between June 30, 1911, and June 30, 1913. Old box taken out and backfilling put in.

15 old wooden box culverts replaced with concrete pipe between June 30, 1911, and June 30, 1913. Old box taken out and backfilling put in.

4 old box culverts rebuilt with wood between June 30, 1911, and June 30, 1913.

685

16 wooden box culverts found to have been omitted from 1911 appraisal.

4 additional cast iron culverts put in between 1911 and 1913 appraisals, not replacements.

7 additional wooden box culverts put in between 1911 and 1913 appraisals, not replacements.

5 additional concrete culverts put in between 1911 and 1913 appraisals, not replacements.

2 additional concrete pipe culverts put in between 1911 and 1913 appraisals, not replacements.

1 cast iron pipe culvert omitted from 1911 appraisal.

10 open culverts found in 1913 to have been changed to box culverts. No date of change.

On July 21, 1914.

CADARETTE, recalled.

Redirect examination.

By Mr. Eldredge:

I have compiled a statement showing the percentage of curves, straight track, etc., on the main line of the company in Michigan.

THIS PAGE BOUND

686 I know the terminal property of the D. S. S. & A. at Houghton. In the past, it has been used for shipping rock by boat to canal entry near Houghton, and logs have been unloaded there. The principal use I remember was when Portage Lake bridge was wrecked in 1905, when freight going north of Houghton was transferred across the lake at this point. In my judgment, it is necessary for the South Shore to use, as it is its only water front property north of Baraga; it has tracks paralleling the shore for its entire length, within 15 feet of the water's edge. The water is deep to the edge of the land, so boats of reasonable size can go within a few feet of land; should Portage Lake bridge again become injured, we should have to ferry, as we did before. Such an accident nearly happened this spring.

CADARETTE.

Recross-examination.

By Mr. Wykes:

In figuring curves on this line in Michigan, I have taken all curves of every degree, and didn't separate into different degrees of curvature. In figuring the amount of level line, I have taken all grades of every elevation or change of elevation.

The Houghton water front was used for stone work purposes to 1900, about four or five years before which it was used for transferring freight. When the bridge is out of commission, we run trains on it. We load the cars on scows at that point, and tow across the lake, and there transfer to Mineral Range. That was
687 during the season of navigation of 1905. We used the old trestle for that purpose. The scow can go only within 15 feet of shore. We transferred no passenger cars that way.

(This witness was later called to testify before the Court.)

688 On April 24, 1913.

CHARLES HANSEL, a Witness called by Defendants.

Direct examination.

By Mr. Wykes:

I live at Cranford, New Jersey; am 52 years of age. I am a civil engineer, economist and investigator, with offices in New York. My experience and education may be detailed as follows:

1. Locating and Constructing Engineer for Denver and Rio Grande Railroad, four years. Division Engineer, in charge of buildings of first division of the Denver and Rio Grande into New Mexico.

2. Chief Engineer, Wabash Railway, at age of 25, 1884 to 1889. During that time, originated premium system for inspection of railroads, which has since been adopted throughout the United States.

3. First Consulting Engineer, Railroad and Warehouse Commis-

sion of Illinois. Sent to Europe, by State of Illinois, to report on railroads.

4. Commissioner to Europe for the World's Columbian Exposition.

5. Vice-President and General Manager of the National Switch and Signal Company. Installed important signal work on all trunk lines in America and the first automatic signal system and power interlocking plant in England.

6. Devised complete system for commercial accounting and cost finding.

7. Commissioner, appointed by the Governor of Michigan as a Member of the Board of Review, to adjudicate problems connected with the State Valuation of Railroads. See Department of
689 Commerce and Labor, Bulletin 21, entitled "Commercial Valuation of Railway Operating Property in the United States," in 1904, p. 77, as follows:

"In order that there might be no question as to the suitability of the methods employed, a board of review was appointed consisting of Mr. Octave Chanute and Major G. W. Vaughn of Chicago; Mr. Charles Hansel of New York; and Prof. Charles E. Greene of Ann Arbor. All these gentlemen are members of the American Society of Civil Engineers, Mr. Chanute being a past president of the society. With years of experience to ripen their judgment and with minds free from all details, they are asked to consider the different questions arising in the work about which there might be doubt, and to formulate rules for procedure in those cases admitting of a variety of opinion, as, for example, the division of rolling stock in interstate roads, the value of right of way, the percentages to be added for the items of engineering, legal expenses, interest and discount, organization and contingencies, and many others."

8. President of the firm of Charles Hansel and Company.

9. Chief Engineer, Cincinnati Union Depot and Terminal Company.

10. Commissioner appointed by Gov. John Franklin Fort of New Jersey, on May 4th, 1909, to appraise railroad and canal property in that state. The Legislature of New Jersey, in 1910, decided to have the work of revaluation of railroads conducted by one commissioner, Charles Hansel. During the past year, some 80 men have been engaged in surveying every foot of railroad property in the State. This will be the first complete work of the kind ever attempted.

11. Member, American Society of Civil Engineers.

12. Member, Special Committee of American Society of Civil Engineers, on Engineering Education.

13. Member, Engineer's Club at New York.

690 14. Member and Past-President, Chicago Engineers' Club.

15. Contributor to North American Review and various technical journals.

I am engaged to supervise the valuation of the Pennsylvania railroad and its affiliated companies, and in the second place I am a member of the eastern committee of four appointed by the special

committee of railroad presidents, consisting of 18 presidents, to confer with the Interstate Commerce Commission and assist in conducting the valuation of all the railroads in the United States, under the Federal Valuation Act, socalled.

The Indiana Harbor R. R., now consoldiated with the New York Central, was constructed from Indiana Harbor to Dansville, Illinois, 110 miles in length, double track, and crossing the arteries of 23 railroads east and west, the majority of which crossings were at grade. I was in charge of the negotiation of all the contracts for these crossings with the other railroads. I also had direct charge of designing and installing all of the water stations, and was Consulting Engineer for the whole system, and at different times I acted as President. From the time we began construction to the time we got in operation was about nine months; handled about six million yards of earth.

The New Jersey appraisal comprehended 125 corporations. The majority of them are involved in what might be termed seven systems; for instance, the Central of New Jersey has 27 subsidiary corporations. The systems are the Pennsylvania, the D. L. & W., the Lehigh Valley, Erie, Central of New Jersey, and the Susquehanna & Western. I was in absolute charge of everything, and the officers of the State were called upon under the joint resolution to assist me in anything I asked of them.

691 I was engaged to make a valuation; after having done so, I incorporated that valuation into an assessment for taxation. After that, the State retained me to defend the assessment in the appeals of the railroad, so the whole time was over two and half years. The highest number of men I had engaged was 110; we cross-sectioned every foot of railroad and got our own data, as very little data existed in the hands of railroad companies, because it was an accumulation of little old companies incorporated into a big system, and they themselves had very little information, and it was so important in value that we ignored all data, and cross-sectioned, measured and calculated every item in the State.

New Jersey is more or less of a terminal state; consequently the percentage of miles of route or distance between points to the total miles of all tracks is small. In other words, while there are but 2,550 miles of route, there are over 5,500 miles of track, there being considerable third and fourth track there.

With reference to my connection with the Michigan 1900 appraisal, a board of review was appointed consisting of Mr. Octave Chanute, Major G. W. Vaughn of Chicago, Mr. Charles Hansel of New York, and Prof. Charles E. Greene of Ann Arbor, they were asked to, and did, consider the different questions arising in the work about which there might be doubt and to formulate rules of procedure in those cases admitting of a variety of opinion, etc.

The plans on the Cincinnati work in which I am presently engaged as Chief Engineer call for an investment of about 35 million.

692 In the detail I have given of my experience, I have just given the principal employments and works that I have been

engaged in, to show the variety of experience, instead of all the experience.

It might be interesting to observe that in New Jersey is found all of the problems of construction that are to be found in all of the other states. For instance, we have the heaviest construction, in New Jersey, of any state in the Union; that is the D. L. & W. cut-off. Then we have some of the cheapest construction; we have the most costly tidewater terminals; then we have tunnels in various classes of rock, some in the hardest in the United States; then we have subaqueous tunnels and canals, which we valued.

I began my investigation of South Shore August 5, 1912. I made an inventory, and found the cost of reproduction new and the present value of the entire property engaged in railroad business in Michigan.

Defts.' Ex. 15, Hansel, is my inventory, and contains my results. I proceeded upon the specifications as shown upon page 5.

The prices applied and the items and property taken were as of October 1, 1912, as nearly as I could fix it. The prices were obtained from my experience and office records, where I have a great deal of such data, and extensive compilation of unit prices. Those prices were checked with the actual costs to the plaintiff of certain of the same class of articles, as indicated by the books and vouchers, and in my judgment the prices used are fair, reasonable and proper. They would be fair not only for October 1, 1912, but also for a con-
693 siderable period before that time. The prices given to us or found on the purchasing agent's or auditor's books, were surrounding or before that period. For a year or more before this date the prices would be lower, because materials and labor have advanced. I endeavored to give plaintiff credit for what they would have to pay about October 1, 1912.

My experience has indicated that the tendency of prices to October 1, 1912, was up. General tendency applying to all items that enter into railroad construction would indicate that during the past few years there is a more or less upward tendency in prices. The labor and material costs more money. On some things, where skill comes in, such as concrete, we are cutting down the price. The ratio of operating expenses to earnings is converging. The only thing which can keep them apart is the volume of business.

Defts.' Ex. 17, Hansel, is framed upon Complt.'s Ex. 2, Riggs; the areas upon it within the red line are intended to show what I find to be the land presently devoted to railroad use. It applies only to rural lands.

The purpose of the plan was to include, as devoted to railroad use, the part within the continuous red line, except where it is excluded by the broken line within it. Where the continuous red line is made by a broken line it is intended to indicate that the company had no deed to the property, but were occupying it, and we gave them the benefit of ownership, as if they had a deed. Opposite the line from place to place is a statement of the number of feet held or owned by the company. The lands in the smaller villages are included in Defts.' Ex. 17, Hansel, except where we have furnished de-

694 tailed maps, which will be later introduced as exhibits. Where we stopped computing the rural right of way and began the computation of high priced copper or city lands, that is indicated by a dark line drawn at right angles to the rigth of way with a cross at each end. Defts.' Ex. 17 is intended as a graphic description of what is indicated on page 16 of Defts.' Ex. 15. Being on a very small scale, it can only be graphic and approximately correct. Defts.' Ex. 18, Hansel, is a blue print map of Sault Ste. Marie, showing the lands of plaintiff (in red) and Soo line (in yellow) and Soo Union Station grounds (in black). Each parcel referred to in Defts.' Ex. 15 is given a corresponding number on Defts.' Ex. 18.

Land on Defts.' Ex. 18 included within the single yellow ink line is that which in my judgment is devoted to railroad use by the two companies at the Soo. I have considered them as operating as a whole, and allow them the necessary land for joint operations, and divided the land between them equally. I have indicated on the map the non-railroad use in yellow lettering.

I did not include any of the property of the depot company in the body of the report (Defts.' Ex. 15), but included it in the appendix (p. 256). The value stated opposite various descriptions of land (pp. 17-22 of Defts.' Ex. 15) are the present value of the land. That figure represents my judgment of the present value of each of these descriptions, and I would consider that was the value to acquire, considering all the elements. I did not depreciate any values for land. The value opposite each description is the value or cost to acquire which I have fixed.

695 Total value of land used by South Shore in Chippewa County is $55,423; by Soo Union Depot $56,600; total $112,023. In getting at the value of land for Chippewa County, we examined the prices placed on the property by Mr. Riggs, investigated the character of the property, and based our conclusions on those investigations. Our differences are mainly in area for property in Sault Ste. Marie. I have practically accepted Mr. Riggs' prices for that.

In the mining district, values are very problematical, depending greatly upon the owner of the mineral rights in some cases. In the Negaunee and Ishpeming districts, we established a value of $3,000 an acre in the active mining portions and $1,000 in the potential mining district. The values in Ishpeming and Negaunee were taken at a higher figure.

Defts.' Ex. 20, Hansel, is a detailed map showing the railroad property included at Marquette. The descriptions are identified on it by the numbers appearing opposite the descriptions (on pp. 19 and 20 of Defts.' Ex. 15).

Page 18 of Defts.' Ex. 15 shows railroad (red and green) and non-railroad (yellow and brown) use.

At Marquette, we separated the shore front property, in that we gave it a value for the riparian rights separate from the up-land value; we examined the records, to ascertain the considerations which had been given for various properties, and also the assessed value, as a factor in aiding us in our conclusions. We ascertained the value of

contiguous and similar property, and made some inquiries of
696 real estate men, though not extended. Based on those investigations, I arrived at the values stated.

In getting the values of $1,000 and $3,000 per acre in the Ishpeming and Negaunee districts, we investigated, as far as we could, conditions attendant upon construction there; owing to the mineral rights, the conditions were ususual. The analysis of such purchases and payments as have been made would, in our judgment, average through that territory $3,000 in the active, and $1,000 in the inactive, districts. The value must of necessity be an estimate and a matter of judgment. Our judgment was dependent in part upon the inquiry and upon knowledge of prices paid in condemnation proceedings.

While some of it would be higher, some of it would be lower, and it is impossible to judge it accurately. I don't know of any expert in that particular class of values; I don't pretend to qualify as such. It is the same judgment that I would give a client of mine who had engaged my services to tell him what he could do in a certain territory. This is my judgment, all through. It was based upon my belief as much as anything, from experience, and going over the territory, and inquiries made by myself and my subordinates.

Defts.' Ex. 21, Hansel, is a blue print showing descriptions in the mining region. The values through the mining district were arrived at in the way just described. We did not there take into consideration the normal value as reported by the Tax Commission.

In reaching the land values in the various places, we used whatever information was available, and made inquiries as we
697 could, except in the cases of rural land, and observed carefully the conditions, character of soil and location, and, to some extent, used sale values. In Marquette, for example, we took them from the county records, assuming that the specific consideration was correct. The sale value is oftentimes hard to get at from the records. I would rather have the opinion of a man experienced in getting right of way than to depend upon the sale values shown on the records.

The values I placed upon the land are, in my judgment, fair and reasonable, and I have also included sufficient values for rural lands to take care of the added percentages for cost to acquire for railroad purposes.

My values for land throughout represent my judgment of cost to acquire for railroad purposes. I considered the cost of acquisition to be the value. I only made use of Mr. Riggs' results (except where otherwise stated) as to land values.

I used three prices per cubic yard for earth grading: 20¢ for easy work in sand, 40¢ for grading at sink holes and soft ground, except on the new double track east of Negaunee, and 26¢ for other earth work. For loose rock, I used 50¢ and for solid rock $1.35.

The quantities were considered in relation to the work. Sometimes the character of the material is not the essence of the cost; a fill of a foot scattered over long territory would be costly, no matter what material, while if 3 to 6 feet high it could be done cheaper.

This illustrates that the price depends upon a variety of things. The
698 prices I fixed are, in my judgment, sufficiently high. It has been my experience that grading in construction could be done for the price I fixed. In my judgment, the entire grading, clearing, grubbing, retaining walls, and rip rap could be produced new for the amount I have stated, or less. The amounts are $2,442,311 for value new, and $2,419,763 for present value (p. 37, Defts.' Ex. 15).

The average price of ties during the past five years, as determined from reports to the State Board of Assessors, was 33 cents. To this we added 7 cents to cover inspection, loading and transportation, making a total value new of 40 cents per tie. The 55% condition I use assumes a life for the tie of 7 or 8 years. Many of them are not good for that time. On the very best maintained railroads, where they use oak ties and stone ballast, we figure the average is about 75%; 75% of value new may be 100% efficiency. I do not say that fixing 55% condition is fixing the per cent of efficiency, because that wouldn't be fair to the railroad.

The wear on curves is on the inside of the outside rail and on the top of both rails. The tendency of the curve is to force the flange of the wheel against the inside of the ball of the outside rail. I would not expect to find any more wear on the inside rail than on pieces of straight track.

I am now speaking of general conditions. A curve could be so sharp that the trucks of a freight car, which had been standing and had gotten stiff, wouldn't slew, and then you might find a wear on both the inside of the outside and the outside (inside) of the inside rail, but you wouldn't be apt to find it there; still it could possibly be some contact there; I would say practically no wear.

Q. That is on a sharp curve?

A. On a curve practically that you couldn't operate a passenger
699 train around at all, but even on that curve the greater wear occasioned by that condition that I have named would be on the inside of the outside rail.

Q. Take where the outside rail is super-elevated and take a normal curve, not a sharp one, what would you expect to find there as to the condition of wear; where would you expect to find it?

A. On the inside of the outside rail and the top of both rails; in other words, the cross-section of the ball of the outside rail would be diminished greatly in excess of the cross-section of the inside.

Q. Would you expect, or has your experience indicated, that the super-elevation of the outside rail causes a greater wear on the inside rail?

A. No sir.

Q. Now, it has been stated in this case that the super-elevation of the outside rail causes a greater wear of the inside rail due to the movement of the freight traffic, in that the outside rail is elevated for the passenger service a little higher than that service requires; is that a true statement?

A. I would consider that it was not a true statement of conditions.

Q. And you would not expect, then, the freight train in passing

around that curve, where the outside rail was elevated for the passenger service, to cause any greater wear to the inside rail than as if the outside rail hadn't been elevated higher than the requirements of the freight service?

A. I would not.

700 The Master: Can you see how there might be a difference of opinion with regard to that?

A. No sir, it is a matter of fact; it is not a matter of opinion.

Q. Have you ever made any observations?

A. Many.

Page 133, Defts.' Ex. 15, Hansel, Ballast. In my judgment, ballast should be depreciated; I find the cost of ballast on the South Shore, exclusive of side tracks, to be: new $667,807; depreciated $560,480. I got at the amount of depreciation by its condition, and through experience that ballast is always in a depreciated condition, average throughout the road. They cannot ballast any considerable amount of the line at one time, because it has got to be done between trains; even if they set out with a ballast outfit on every section of the road, they would have to do it between trains. There is always a hiatus there when they cannot do that, and there is always a depreciated condition.

Ballast new is worth what it costs, if worth is to be determined by cost of acquisition.

I have great difficulty with this term "value," and I am trying always to have hooked on to it some application. If the D. S. S. & A. property was today for sale as a going property and I was called in to tell proposed purchasers what they would have to spend to put that in hundred per cent condition, I would have to include something for ballast, and that something would be the sum I have set forth here, as near as I can judge.

701 The Master: Now, would you determine that by inspection or by some rule of depreciation, or how would you get at that precise amount?

A. I would do it exactly as I have done it. That is the only way I know how to do it. Ballast, in depreciating, increases in the value by solidification, and some percentage perhaps should be added to an old road for a certain purpose on account of the fact that it is old, and the ground is settled, but you would hardly feel, on the other hand, that they were to be taxed on that theory, and yet the intrinsic value of the property is increased by seasoning.

Q. The ballast might be depreciated to a certain per cent and still the ballast perform the office of carrying the traffic just as well as if it were new?

A. Yes, if that per cent is maintained right along as an average per cent all over the line. Here I might have a hundred per cent adjacent to 25 per cent; to-morrow that 25 per cent is changed to a hundred, and the hundred begins to depreciate, and so on all along the line, it is constantly evoluting.

Q. When you say the hundred begins to depreciate, that means you are approaching, all the time, nearer to the point when you must renew it?

A. Yes, that is it.

Q. And if it never required to be renewed, and would fully perform the office, then it could be carried at a hundred per cent, could it not?

A. Yes, but it must be, and is, renewed constantly.

702 Q. And if the South Shore were all ballasted new tomorrow, and you were making a report for purposes of purchase, that would include the element that you had a time ago of the expenditure necessary to bring it to a hundred per cent condition; you would not then include anything on account of ballast, would you?

A. No.

Q. But if, on the other hand, all of the ballast were five years old, would you include something?

A. I would. That is because the ballast, having been in the track for a period greater or less, there must be some renewal.

Ballast is somewhat peculiar in its relation to upkeep; it is a never-ending cost of upkeep of the track; there is no time in the working season, between the time of frost going out of the ground and the imminent danger of frost coming into the ground, that ballasting is not being carried on. Even in the very best conditions, there is a constant flow into the property of ballast all the time; it disintegrates, blows away, and settles into the embankment, perhaps owing to the character of the ballast, or, depending upon the character, it may settle into the earth beneath it, but other classes blow away and are carried away by the elements, so that there is a constant stream of upkeep there all the time, and yet it cannot be up to a hundred per cent.

The greater part of the depreciation is dependent upon the country, the climatic conditions and the ballast; stone ballast is not affected very much by weather conditions. On this railroad the sand would be materially affected by weather conditions—perhaps more by wind than by rain; and gravel, not so much. St. Ignace gravel is

703 good *is good* gravel; it enriches the roadbed, without any corresponding value. The seasoning makes a better roadbed. All things that help to season it make it better.

On pages 234, et seq., Defts.' Ex. 15, in addition to the values fixed, I added percentages to take care of overhead expense of survey of the line, right of way, engineering, taxes, inspection of equipment and contingencies. All the items contained in the schedule have been considered and affected with overhead charges. All the overhead charges are computed upon other overhead charges; for example, the contingency item was included in the amount on which interest during construction was computed.

In Defts.' Ex. 15, beginning with page 234, I have treated in detail the subject of overhead and incidental expenses. What is there set forth was prepared by me and represents my judgment.

The first expense in railroad construction is the survey of the line, which in the case of the plaintiff would be comparatively uniform for every mile of road. On the other hand, the ratio of the cost of survey to the cost of construction would be above the average, because the graduation is light, and a survey conducted in the sum-

mer would be impeded by foliage. We have fixed the cost of survey by actual estimate at $50,000. If we stopped there, it would appear that $50,000 was the only item that was considered for the engineering cost, but, instead of putting on percentages, as is commonly done in the estimate of a prospective construction, I have analyzed each factor and tried to get at exactly what I would have to spend for each of these various items, and to that sum we
704 have added ten per cent for unfor-seen expenses. In my judgment, the surveying portion of the engineering cost could be done for the sum stated. We all know that there are no engineering difficulties on this line, and that any engineer qualified as a division or resident engineer would be fully competent to take the post of Chief Engineer of this particular railroad. In order to compute that sum of $50,000, I constructed ten survey parties, and in that way, considering their compensation, subsistence and other incidental expenses, and in view of the ease with which the survey could be made, excepting some isolated cases, I considered that particular item, included in the total of engineering, would be covered very easily by $50,000.

Such structures as are on the line would be designed by the bridge company; the organization for the survey and construction of such a character of road would not call for the services of a bridge engineer in the company's employ, because there are so few structures that he would have to design. I myself would send the bridge company the cross-section of the stream, and give a general design of what I wanted, and they would then prepare details and they in turn would be criticized by the chief engineer, but he wouldn't himself be apt to attempt to design those structures, which are insignificant.

Q. Now, what other engineering costs have you found would exist on the South Shore?

A. The engineering costs during construction, and perhaps after construction, so far as the equipment is concerned.

The Master: Better take it in sequence.

The country traversed is practically devoid of highways.
705 The first construction would be the building of telephone lines, to establish communication; headquarters would be established at various points, including railroad crossings, and the entire construction would be completed within two and half years. Construction could be hastened by employing a larger force and increasing unit prices. It wouldn't be practical, however, to attempt to open up the work on the entire line at once, as the quantities in graduation are not sufficient to induce grading outfits to come into the territory for short-time work. Two years and half should be the maximum time for any specific part of the road to be constructed in. It wouldn't be advisable to start construction all over the road at the same time, build certain portions of it, and throw it into operation just as soon as possible. While I have not said that I thought the entire proposition could be accomplished in two and half years, I would undertake to do it. The faster you do those things sometimes, the more economical it is, instead of drag-

ging it along and fiddling. Two and half years would cover the interest charge on account of construction. That means that if they started it all simultaneously they could of course get it done very much under two years and a half, instead of over.

On the Indiana Harbor railroad, from the start of construction to the finish was a little over nine months, and we handled six million yards of earth in 110 miles, and we crossed 23 different railroads, which of course is an impediment to construction, because they don't allow contractors' teams to cross operating railroads, so we had to ship in the contractors' outfits, and unload at each of the several crossings, so they could work each side of the crossings. Those crossings also required safety appliances; we had to interlock all the crossings. I negotiated all the contracts with the various railroad companies, and installed the signal apparatus, be-
706 fore any crossing of the senior company was permitted. That was accomplished within the nine months.

Engineering headquarters would be at Marquette, with different residences east and west. Material yards would be established at Sault Ste. Marie, St. Ignace, Trout Lake, Shingleton, Marquette, Ishpeming, Sidnaw and Houghton; that would be the plan that I would use. It is estimated that ten field parties equipped for camping would be required during the entire period of construction, at a total expense of $170,000. I would be very glad to undertake that contract for that amount of money. In addition to the above expense, the main office at Marquette, with two divisional engineers, would have to be maintained, at an additional expense of $35,000, or a total for the field and office engineering force of $205,000, exclusive of the $50,000 first above mentioned.

Without suggesting that the qualification of your divisional engineer is not such as would fit him for more difficult work, I would say that he would be fully competent to take charge of this as Chief Engineer; that is to say, if you wouldn't bring an engineer who from his age or experience or practice would cause him to demand $25,000 a year, he wouldn't be as good as Mr. Cadarette at the salary he is getting, or I would hope some advance over that, so that I only speak of this to show that it is not high class engineering; almost any graduate one year in the field would be competent to supervise that. I fixed this in a lump sum, instead of by a percentage, because to my mind a lump amount does not signify anything, but if you analyze, as we now do in all construction accounts, the closer you analyze the more accurate you can be. Any given per cent is ab-
707 surd, because five per cent on one road would be entirely insufficient, whereas on another it would be entirely too high, on account of the character of the work; there would have to be more engineers on the building, for instance, of a line like the New York, New Haven & Hartford, and they would have to be higher class average engineers. All that a chief engineer here would need would be a field party or field parties in charge of a transit man, whom you could easily get at from $100 to $150 a month, and I based it on the higher figure.

In a recent appraisal on the New York, New Haven and Hartford,

to justify securities that had been issued, an amount was fixed for engineering which, reduced to a percentage to compare with mine, was 2.2%. Percentage for engineering signifies nothing; you must know the items it is on.

The N. Y. N. H. & H. is not comparable with the South Shore; it is a grand terminal railroad, with a most costly terminal and hundreds of junctions; there are 50 odd companies in the leased line, and each of them has to join on somewhere. This is illustrative of the fact that it is absurd to compare a flat percentage until you know what it is to be applied to. I don't think that this average percentage included the value of the land. The percentage of 2.2 seems to be the total allowance reduced to a percentage on the total value.

Mr. Butler: Yes, it is not the way it was applied. He takes the dollars allowed for engineering, and applies it to a sum including the value of the terminals and right of way, which would be a very very large sum in this grand terminal, wouldn't it?

A. Yes, on that subject, and illustrating further why the New Haven is an entirely different condition is that the class of
708 patrons demand such a high class of service, and the public utilities have urged upon them very large expenses for the benefit of the public, and all of these expenses include very high class engineering; for instance, the New York connection over Hellgate, with the biggest arch ever constructed. It requires very much higher class engineering, and, in fact, in the appraisal of the New Haven by John F. Stevens, he thought it necessary to have two men, to each of which he paid $10,000 annually, and the others in the same proportion, showing that he felt, on account of the great value of each item in the property, that they must get high class talent. The new Haven company has a great many tide-water terminals that are very costly, and under the Massachusetts law they have to eliminate a great many grade crossings, and they are doing it also on their own motion. That was an expense that is not found at all on the D. S. S. & A. The same might be said of the Pennsylvania, or any first class road, but the New Haven stands in a class by itself as to the cost of operation and cost of plant; therefore, the engineering per cent would hardly signify—it has to be analyzed closely.

I added for taxes during construction a general amount of $50,000, and 1% upon the real estate, making $63,709.

Q. The contingency item; you have allowed something to cover that, and will you tell us how you arrived at the amounts that you fixed, and what amounts you have added?

A. In the construction of a railway in a new country, where many of the conditions are unknown and frequently difficult to estimate, the engineer must make provision for these unknown costs. This is frequently done by adding a percentage to the total of the established cost. Where the right of way and terminals or termini re-
709 quire the acquisition of costly lands, where the consequential damages are likely to be high, a considerable sum should be provided for contingencies. In the case before us, we know all the conditions, excepting, perhaps, I should have added the foundations of the retaining wall and some of the bridge columns, because they

were examined, and there is no important construction where the foundations are hidden, and in case they are we allowed liberally for such unseen foundations. We have estimated the extra quantities of graduation necessary because of sink holes and soft ground, and the quantities of graduation measured in the full prism have been increased wherever the condition of the ground has shown the necessity of additional material, as demonstrated by several years of operation. Now, those soft spots, a good many of them, would not have appeared in the construction or the survey of the road, especially in the survey of the road; the engineer wouldn't be apt to sound all of these depths, because it generally is done by the cross-section party, but the estimate has to be made before you can finance and before any cross sectioning is done. The waterways and bridges have been computed as they actually exist; therefore, there is no question of contingencies in the reproduction of the thing which has been built. In further explanation, if any is needed, of that paragraph, I would say that the difficulty in a first survey is to decide upon the openings for water and for other purposes. Oftentimes it has been found after the road was in operation that their openings were insufficient. I think, generally speaking, that is true, but, having built these and having had the experience of the openings and bridges necessary, the contingency so far as that condition has occurred is, I think, eliminated.

710 The ballast has been measured, as stated yesterday, as have the ties and rails, and all stations and structures are fixed quantities. Now, before you construct, you cannot imagine properly all of the buildings which you would have to have in your final operation, but, having these now before us, we know what we have got to produce to make an equivalent of the present construction. Shrinkage has been allowed for embankments, and in taking profile measurements care was exercised to favor the greater quantity. I was particularly concerned about that, and gave instructions that they should be called off from the profile by two different persons, at different times, to check up any error, and always give the measurement in favor of the higher quantity instead of the lower. In view of the care with which the elements have been separated, measured and considered, we do not feel that an allowance of more than 10 per cent should be made on the following: Grading, Sidetracks, Shop Machinery and Tools, and Engineering. After having added on those items, as before stated, for engineering, we again add ten per cent legal expenses, organization and general interest and taxes, furniture and fixtures and stores and supplies. To all of these items has been added ten per cent after having in graduation; for instance, included quantities that did not appear in the prism but were assumed to have been used in the construction, and after adding very heavy percentages to some parts of the road, in order to determine the final quantity, we then again add 10 per cent to cover any possibility.

Q. Now, why would not such a contingent allowance be necessary on such items as ties and rails?

A. Because they are capable of being accurately determined.

We did not count all the ties, but counted typical sections
711 and then took also the standard of the railroad company into consideration as to how many ties they expected to keep up in each mile of track, so that the rails and ties are not subject to contingencies as long as you know the distance which you have to cover—the miles of route.

Q. The method of your ascertainment of those items, for example, ties, is equally accurate for practical purposes as a count, is it not?

A. Yes, I think so. It is hard to vary the number of ties in a given length of rail, because, even if you desire to get more ties in than 16 or 17 to the rail, it wouldn't be policy to do it, because you have got to get between the ties with your tamping bars, and if you get them too close you couldn't tamp up the road.

Throughout the entire line there are no conditions which invite legal troubles, except through Negaunee and Ishpeming; a small legal staff acting with a right of way agent would have no difficulty in handling all legal matters. In addition to the $20,000 provided for right of way agent, we think that $50,000 will cover the legal expenses, making a total of $70,000 to cover the item of acquisition of right of way and the legal expenses incidental to any other feature of construction.

It is impractical to determine the office cost of acquiring land by using some per centum of entire cost of the road. The right of way is through a very thinly settled country; much of the land is held in large tracts, and in our estimate of cost to acquire we have added at least a hundred per cent to the normal average value of the rural land in each county. We believe that, with the D. S. S. & A. obliterated,
if we were given the task of acquiring a right of way, much of
712 the land would be acquired free of cost; rights of way and additional lands are acquired by operating railways in States where land values and consequential damages are much greater than in the Northern Peninsula of Michigan for not more than 25 per cent in excess of the normal value. We are required, however, to determine as near as practicable the sum that is necessary to produce certain property. It is a suppositious case, and we feel that all coubt should be resolved in favor of contingent or unforeseen expenses; with these conditions in mind, we have included in the overhead expenses a sum of $20,000 to cover the expense of the office, the field force and the right of way and land agent. That, added to your $50,000 for legal expenses, makes the $70,000 that I included under Legal Expenses.

The organization, drawing mortgages, etc., will be done by the legal department, the printing of bonds and stocks and the general administration over and above the engineering and legal expense should not exceed $100,000. I consider that a very liberal figure. That is an arbitrary figure. You couldn't figure a percentage. It is better to have as much analysis as you can, I think, of all these items.

The $100,000 was just my opinion; you couldn't analyze it; nobody can tell how much you are going to pay for the printing of bonds or stock until you have them printed, or the cost of drawing

a mortgage and of supervision. I don't see how anybody could do anything more than say, well now, with such a force for a period of time—I do analyze it to a certain degree, by going over those features—such a salary, the head of the department and his aides would be perhaps such as a superintendent of construction, after the operation had partly begun, until that time construction
713 should be in the hands of the chief engineer, but there is in the handling of construction trains, as soon as you get up to that point why you are out of engineering department and into the operating department, but it has been the fashion to keep up that construction account as long as they could, and many of the railroads in the country have been seriously handicapped by that construction account because that was a common dumping ground for anything the promoters saw fit to dump in there.

Q. You have added by way of interest on the investment during construction; will you give us the methods *at* which you arrived at the amounts or percentages added, and the amounts?

A. The financing must provide for interest on all disbursements during construction. This interest must be paid, not only upon the actual money expended, but upon the face of the securities hypothecated to secure the money; construction bonds bearing 5% cannot be sold on better than a 6% basis, or about 85; it is impossible to precisely determine the amount of interest chargeable to construction, but it can be fairly approximated, and I have endeavored to analyze that feature as follows: The first important item is the right of way in lands; upon this item, interest at 6% is allowed for two years, or 12% in total; items 3, Graduation, and 5, Bridges, Trestles and Culverts, may be fairly considered as evenly distributed throughout the entire period of 2.5 years, and on these items we allow interest at six per cent for 1.25 years, or 7.5% on the total under schedules 3 and 5.

Item 6, Ties, will be purchased as soon as possible after construction is determined upon and paid for when delivered on the line. The number of ties required would necessitate shipments from
714 outside, which would possibly be received at railroad crossings, where tie yards would be established. The average time of purchase would not exceed 1.5 years, and we have allowed 9% on the purchase price of ties. Items, 7, Rails, 8, Track Fastenings, and 9, Frogs, Switches and Crossings, are put down last, but in order that no delay may occur, these materials should be delivered at the various yards in advance of the time the roadbed is ready to receive them, and on these we have allowed 6% interest.

Item 11, Track Laying and Surfacing, is figured 6%, and Item 10, Ballasting, should follow track laying immediately, so as not to kink the rails. The expense attendant upon these two items should not cover a period longer than one year, and, to provide for the interest charge, six months' time has been taken for the average, or 3% on items 10 and 11.

Item, 12, Fencing, is the last item constructed, ordinarily, and is generally left until the road is open for operation, when men and materials can be conveniently transported. We have allowed three

per cent on this item, as on 13, Crossings, Cattle Guards and Signs, and 14, Interlocking and Signal Apparatus.

Item 15, Telegraph and Telephone Lines, is one of the first expenses, and on this we have allowed 12%. Item 16, Sidetracks, are built partly during the time general construction is going on and partly after the line is in operation. An allowance of 6% has been provided to cover interest on this item.

Items, 17, Station Buildings, 19, Shops, Enginehouses and Turntables, 22, Water Station, 23, Fuel Stations, and 28, Miscellaneous Structures, are built after grading is completed, and are not
715 generally finished much in advance of the line. They are generally delayed until we can carry the material on cars. Materials must be purchased in advance, and an average of six months consumed in construction. To cover this interest charge, 4% has been allowed on items 17, 19, 22, 23 and 28.

Items, 20, Shop Machinery and Tools, and 18, Construction Tools, are allowed interest at 3%, to cover the average time on hand before the road is opened, and, of course, in machinery you always get credit if you ask for it, 30, 60 or 90 days, especially if you are buying an amount sufficient to accommodate the whole road.

Items 26, Docks and Wharves, and 27, Electric Plants, are among the last items to be built, and none of these structures will require more than one year to construct. To cover interest, 3% has been allowed.

Item, 29, Survey and Engineering Supervision, will continue throughout the work; an interest charge of 7.5% has been provided.

Items, 30, 31, 32 and 33, Equipment, is generally purchased through an equipment trust agreement, outside of the construction equipment, which is provided by the contractor or taken care of in the unit prices allowed for cost of construction. No equipment is required until the road is put into operation, and generally the first interest coupon doesn't become due until six months after the equipment is received. So no interest charge has been allowed for equipment.

Interest is allowed on schedules 35, 37, 38 and 39 at 6%. The largest expense will be during the latter part of the work, consequently a rate of 6% on total expenditures will fully cover interest charge on those schedules.

716 Q. Would the money on the bonds all be turned over to the railroad company at once, or would the bonds be turned over as the money was needed, as a matter of practice?

A. I should expect to turn over bonds to the bank as I hand vouchers to them to pay, as near as may be; I would always have to give somewhat more in the bonds than the actual monthly pay-roll would call for, or monthly accounts. Of course, if the whole sum was to be borrowed and deposited in the bank of the company who was financing it, it would be very good financing for the banker, but very poor for the railroad, and I wouldn't consider that that would be done.

Engineering on Roadway and Structures, including the survey, $255,000; Engineering on equipment, $61,042; Contingencies,

$479,735; Legal Expense, $70,000; Organization and Administration, $100,000; Interest, $745,349; Taxes, $63,709. In each of these, the value new and present value are the same, none being depreciated; in my judgment, these amounts are sufficient to cover the expense of these items.

For the entire South Shore property, including every item noted, the total value found by me is: cost of reproduction new, $15,531,227; present value, $12,596,114. Those are my final figures for the value of the physical property, including an estimate of $100,000 cash for working capital, but not including the property of the Mackinaw Transp., Soo Union Depot, or Soo Bridge, Companies.

My value, before addition of overhead charges, is:

717

	Value new.	Present value.
Physical value before overhead charges	$13,756,392	$10,821,279
Overhead charges	12.9%	16.4%
Overhead	1,774,835	1,774,835
Adding Overhead	$15,531,227	$12,596,114

I did not follow the practice of taking the flat percentage of each item of overhead cost; I attempted to deal with the case as it existed. I have never believed it proper to assume the same percentage on the items for overhead charges, as these items vary so greatly in different properties. The description of the subject of overhead and incidental expenses is set forth in detail in Defts.' Ex. 15, pages 234, et seq. I feel that my judgment in the consideration of the definite items of overhead percentage is productive of greater certainty and accuracy than adding a flat percentage.

I added for Stores and Supplies: value new, $280,059; present value, $280,059. This was divided between states on the basis of track miles—82.9% to Michigan.

Those are taken as of June 30, 1912; we did not go back over a period of years, but simply found what was then on hand; they might have had more or less at a previous time.

The $100,000 for Working Capital was purely arbitrary, based on our opinion; this is a fair amount; they may have had $50,000, or $150,000.

718 (It is understood that the text of Defts.' Ex. 15 shall be treated and considered as the witness, Hansel's testimony.)

It is my judgment that on Oct. 1, 1912, the South Shore property in Michigan devoted to railroad use as a whole could have been constructed, the right of way being acquired and structures put there, for the figure stated as my value new (p. 4, Defts.' Ex. 15), $15,531,227, or less.

The present value of $12,596,114 represents my judgment of the present condition or value of the property on Oct. 1, 1912. The term "present value" is intended to convey the value new as de-

preciated by the elements *or* use or obsolescence, and has nothing to do with sale value; it might be the same or different.

In my opinion, the property would not be worth any more at any time in a period of three years preceding the date of the inventory, meaning the present condition or value.

As bearing on the item of Interest; it is the practice of railroads to hold back from the contractors generally 10% or 15% of the estimates. I cannot answer whether that would affect the item of interest; the contractor would consider that in his unit price, if he is wise. In fixing prices, e. g., grading, a contractor making a bid should, and does, so far as he is able, consider the contingencies which he is required to assume. The only place he can put them is in the unit prices. The prices he charges is the measure of what he is going to get out of it, including his profit; those prices include
719 everything, except contingencies by way of quantity, because quantities are developed as the work is done, consequently most contracts are based on unit price.

If South Shore were to be reconstructed in entirety, the amount of grading and work required would not be such as to produce any considerable increase in prices of labor or material; it would if it had to be done in six months time, but, under ordinary conditions of construction, taking, say, 2.5 years, it would not. Nothing was allowed in my unit prices for advancement of labor or material due to the demand from reproduction. On Indiana Harbor Railroad, where grading was approximately the same as South Shore, construction was completed in 9 months. I had no intimation that prices increased; the contractor took it at a fixed amount, and seemed to be satisfied with his contract; we had no trouble getting bidders there. I was the consulting engineer.

720 HANSEL.

Cross-examination.

By Mr. Butler:

Defts.' Ex. 15, Hansel, page 17, item 1, 6.3 acres: Riggs' value, $2,500 per acre. I reduced that valuation to $2,000, because of abandonment of certain developments going on at time of Riggs' appraisal, because there was no growth of the town that way, and because I considered $2,000 an acre a very fair price, higher than I would expect to purchase it for; I never bought land at Soo, nor did I ask any person other than Tombo about its value there.

My opinion was $2,500 an acre was high for that land. The improvement on tract 2, (Defts.' Ex. 18, Hansel) had been abandoned; they had taken up the track and were not doing any more filling, the idea being that if there was demand for that character of land the improvement would have been continued. There wasn't any evidence of any development or any demand for that land.

As to parcel 1, on Defts.' Ex. 15, priced at $2,000 per acre; if I had only made the trip to Soo, referred to, I would not be qualified to

give any opinion, but I have had occasion to value property in various states for various purposes. So far as I know, no person is qualified to say precisely what the value of land is for railroad use, especially at a terminal; so many elements enter into value that the value of land for the precise purpose for which it is to be put is entirely a matter of opinion, and cannot be proven. My figure is the estimate I would give a client, based upon knowledge acquired in many years of work.

721 I had before me the statement of Mr. Riggs, but, because the town was not growing in that direction and there was no demand, I would certainly expect to buy cheaper than his values; I saw the testimony taken in this case on the value of real estate at the Soo; I was influenced by everything that had bearing on value. I did not examine the testimony of the witnesses as a judge; I mean that I had the value fixed upon that by Mr. Riggs at the time that he fixed the value; I also had the value given in the testimony, I don't know who by, of various tracts of land in the vicinity, and I had my own observation of the character of the land and the fact that there was no development going on in that section; I considered the value given by me to be as high as I would expect to pay if I were to build the road.

Mr. Wykes: Mr. Hansel's testimony all through, I think, indicates that his investigation was rather superficial as to land values; that is, it is the judgment of a man of experience, not acquainted with the detail. I am going to produce the detail for you.

I understood that there were to be so-called experts on the land employed by the State and therefore I wasn't expected to go into it in the same manner by producing sale values and trying to

722 apply them, as if those experts were not to take up that subject, consequently, I put upon the land the values that I would expect to have to pay if I was called upon by the State or by an individual to give him an estimate of the cost of building that road, and I certainly feel that the investigation was sufficient for that purpose.

The area of the 100 foot strip, item 8, included in railroad use is about 2.5 acres; Deft.'s Ex. 15, Hansel, item 8, shows 3.4 acres at $1,000, or $3,400; that is the price for the land in 100 foot strip, in the triangle of the wye. I don't think the balance of triangle worth that per acre; I didn't estimate that; not included in railroad use, it would be worth under a thousand dollars an acre.

I formed an estimate of the lands inside the wye, in view of severance damages, which is higher than the whole tract; I should say $600 or $700 an acre for whole tract without the railroad on it as the highest estimate.

The remaining land is high priced farm property; that is all. It is not city or suburban property in any sense of development.

The value put on such portions of right of way and station grounds as shown in schedule were the values considering all elements I thought should be considered in acquirement; this includes expenses of acquirement and element of cost on account of forced purchase

and the fact that seller asks and gets a higher price because of the necessities of the railroad.

723 Generally, the railroad has to pay more for land than true value; sometimes it doesn't pay anything. The excess is sometimes as high as 200%, and sometimes more; I always had the cost of acquisition in mind.

I had the testimony taken with reference to values at Soo. I didn't give much weight to Stradley's value of $1,500 per acre, on item three, for ordinary purchase and sale. It didn't seem to me to be the testimony of a person whose judgment I would accept.

Deft.s' Ex. 19, Hansel, St. Ignace, 2400 ft. dock property, #16; Riggs' value, $10 per foot, $24,000; Hansel, $15 per foot, $36,000; that is just my opinion of the value. I saw Riggs' figures before I fixed my valuation at $15. Had no data except my examination, notes and experience. I presume we had all of the testimony at time we fixed that value; am not sure. I went over such testimony as was furnished me, spending 4 or 5 days going over it. I made memoranda as to this property on trip of Aug. 5, 1912. The shore front between the steamboat pier and ore docks seems to be of very small value, has shallow water, and there would probably be no demand for it for any purpose except it be the building of a pier or a dock, and no connection can be made with such pier or dock except by tracks in the street, or through the street.

I don't think I was influenced here by the testimony of Hoffman and others; I don't recall that feature of the testimony.

724 Deft.s' Ex. 20, Hansel, at Carp Furnace, South Shore crosses Carp river in northerly and southerly direction, being a mile from city limits of Marquette. The line follows the lake shore, and, generally, the land on the left or westerly side is fairly high ground up to the crossing of Carp river. On the north side of Carp River and east of the furnace, the line swings to the east over the highway and along east side for a considerable distance. The bluff northerly and southerly of Carp River and the configuration of the ground is such that a railroad approaching Marquette from east, to get a reasonably cheap location, must be close to lake.

That a railroad approaching from east must be between bluffs and the lake renders the property more valuable, because of necessity of use for railroad purposes, than if it were an open stretch of country; not only is the land more valuable for railroad purposes, but because owners would put a price upon it taking that into consideration. In valuing the road through Marquette, I attempted to take into consideration all of the elements which I thought would affect the property's value.

If you had to pay $100 per front foot for the land along the lake shore, valuable on account of riparian rights, I am not at all sure that it would be cheaper to acquire that land than it would be to attempt to go around to the city of Marquette from the east

725 through the hills or bluffs that I have referred to. I believe it would be cheaper and better to take the upland elevation; I would have to study that to be sure. If we were to assume a

reasonable price to be $35 per front foot for the land abutting on the water on which to construct the road between the lake and the bluffs, it would certainly be cheaper to go up on the hillside than to pay that price; I suppose to do this it would be necessary to go up onto the hillside as far out as the city line, in which case the distance would be 1.5 miles at $35 a foot; this would amount to $277,000.

You do not necessarily have to go around the bluff, but you would go on the side of it. I have not figured out at what point you would get down to the lake level; it would be ultimately necessary to get down there, but not of necessity with the main line. I might be higher up with my station in the city and come down to water front with a heavier grade; I presume we would have to come down the front to get to the water.

To get into the best part of Marquette would take 2 miles further, or 3.5 miles, which, at $35 per foot, would cost $470,000 for right of way.

I mean it is 3.5 miles from city line to Marquette station, according to mile posts. I decline to testify as to the difference between the cost of that and a railroad built on the bluff, because I don't
726 know until I survey it; it is my judgment that it would cost more to come in on the lake front, at $35 a front foot for riparian rights, than to go up on the bluff in some way. I am satisfied that, adding the cost of construction down there to the $35 a foot, you would have a higher figure than you could buy the right of way for, adding cost of construction, inland. At $35 a foot, right of way would cost $155,500 per mile, exclusive of other items; I have no idea that right of way inland would cost anything like that.

I don't know what railroad construction inland would cost; all I can say is that my opinion is that, at $35 a foot for the riparian ownership or rights, it would be cheaper to come in there. That is a fact I could only determine on actual survey. Ultimately you must come down from the hill to the lake shore, but not of necessity with the main track; I don't know how you would avoid coming to the lake shore with the main track and get into the heart of the city; I have not surveyed it. The question of relative cost is entirely speculation and guess work on my part; I have not been asked to prepare myself on that subject at all.

Item 31 (pp. 19-20, Defts.' Ex. 15), 1,100 feet water front: Riggs' value, $35 per foot; Hansel's value, $1 per foot. The railroad owned, but did not use, the water front; I didn't class it as railroad use, and gave it a nominal value. I found no riparian use of that property.

727 The only value I gave to the riparian use is value for piers or docks. I found that there was rock thrown down there to riprap the track and protect it from the water; I found the riprap in use and have given credit for that. If there had been any construction there out from the shore, I would have included it as railroad use. The riprap is not of that value; that value is beyond the riprap. Any value given for that purpose is beyond the riprap, under water. The $1 a foot is just a nominal value for railroad use. If you occupy all of land to water's edge, there is not a riparian use of the property.

Land is often bought for use as upland, without buying the riparian rights; you can put a building on it without destroying the riparian rights, or sell it to somebody else to put a dock on, giving right of way over the land to get off the dock, in this case over or under the railroad track. That is often done. It is no good to you unless you want to put a pier on it; that is often done; you hadn't devoted the riparian rights to railroad use.

I don't think you have turned the entire property to use. I can cite many cases where they buy to the shore and do not own the riparian rights at all; it is often the case. I think we found riprapping at that place, and that it had been necessary to riprap other land each side of that, to protect the track. I undertook to separate the land from the appurtenant riparian rights, and to value it in that way; I frequently do that in valuation. Often, they do not own the
728 riparian rights at all, because it costs too much for the purpose of upland. I don't know, but I should say that 1,100 feet strip is 50 or 60 feet wide. I would suppose that that could be bought without compensation for riparian rights; if I was the railroad I wouldn't buy the riparian rights there.

It is my judgment that for $1 a foot I could buy that 50 or 60 foot strip of land 1,100 feet long, and separate it from its riparian rights. There is no valuable use of the riparian rights other than putting structures on them; I can imagine a person might want a dwelling above it with his view unobstructed by docks or railroad sites. The property is platted up to the street adjoining that strip. That is easy to do, of course; that don't give it value, just to plat it. I believe you could purchase that 1,100 feet for $1 a foot, because there is no apparent demand for it other than for railroad use, as now used. I believe I was furnished the testimony of Asire and Robertson.

Along this 1,100 foot strip, the railroad, in a sense, damages the surrounding property.

I was not asked to determine the cost of it at the time of location of the railroad. In getting production cost of the land, I assumed the existence of the railroad; I proceeded to value that piece of land under the conditions existing today, showing there was no demand for the frontage for any purpose. When called upon to get reproduction value of railroad property, you must not take into consideration damage that was done residential property in its acquire-
729 ment. You take it as the conditions exist today; it has been damaged from some cause or other; the value of it is as it is.

We allow nothing for severence damages in our estimate, because, on the other hand, where it has appreciated beyond the cost of the land at the time it was purchased, we gave credit for that unearned increment. We didn't consider what it cost when they built it; that was not our problem.

I didn't consider the value of the adjoining property at the time they built the railroad; that property may have been higher in value at the time they built the railroad than it is today. On the other hand, in some other case, the unearned increment has increased the value of the land over and above what it cost to build, in which case

we considered the increase or the conditions that obtained at the time of the survey.

In taking the parcels I considered them as irregular parcels and of the shape in which they would be required, as purchased. I took the several parcels as owned by the railroad and endeavored to fix a value as of October, 1912, taking into consideration all elements.

Understand, if the Court please, that all of this whole thing is suppositious, at the best; it is hypothetical, and because of those elements it is necessary to exercise your judgment as to all the elements of cost that would come into the acquisition of the land at the time you are considering it, and to say just exactly what weight was given,
730 or if any weight was given to any particular item, in all of the cases, or in any particular case, I am unable to say.

The Master: According to what you have just said, you did take into consideration abuttal damages, if you took any of the elements that would enter into it.

A. I endeavored to.

The $1 per foot is based upon my opinion, the opinion being based on experience and conditions and the evident fact that there was no demand for that frontage other than for railroad purposes. There is not a dock anywhere south of the city, except the Standard Oil pier. There isn't a pleasure boat anchored anywhere, or any evidence of any desire to use the land. Had there been piers—even small ones—owned by the owners of the upland, to get to that water for pleasure or business, I would have considered that, but there is absolutely no occupancy and no apparent object in using that portion of the bay.

I cannot give a supporting figure for the $1; it is simply a matter of opinion, based upon my experience. I could find no evidence that this property had any riparian value. In my valuation I don't consider whether there was any value to the riparian rights; I have never, until today, seriously considered the value of the riparian rights.

Q. And yet you answered the Master today that, because you couldn't see any docks or pleasure boats, it didn't have any value?

A. Well, I wasn't discussing that particular situation, but
731 all of this, I said, if you please, the whole frontage south of the oil pier there was unoccupied, and I did not consider that any of it had any particular value for the purposes of riparian rights, and I still say that it is not used by the railroad in any sense of railroad use.

I've valued riparian rights and upland in property on p. 18*a*, Defts.' Ex. 15, Hansel, reaching a value of $53,750, as against previous value of $62,500.

I think my item 33 is the same as Riggs' second item, 2,200 feet inside Marquette harbor.

Our valuation is divided differently; the value of approaches for ore docks 4 and 5 is my opinion, taking conditions as I found them; I have had experience elsewhere and considered the conditions and the development or undevelopment of the harbor, 100 feet of the dock approach is on east side of Lake St. For the purpose of dock approach, I could see no difference between east and west sides of street, and fixed a price for any purpose of $25 a foot.

Q. Did you in any way consider severance damages?

A. I attempted to consider all the elements affecting value, considering the ownership of the adjoining lands had an *affect* on value.

Item 34, Defts.' Ex. 15, frontage west side Lake St., north line Ely lot to Jackson St., 1,000 feet; valued $30 a foot; it is of greater value than the item under 33, of 100 feet just referred to. The
732 value of $30 was my opinion, considering the size and depth of the plat and the conditions; all the values were made on my opinion. I inquired of no outsider as to the value or sale prices of real estate in Marquette.

The only information I had was the evidence in this case and my personal opinion after going over the entire situation. I examined each parcel, and, so far as I was able, made comparisons of the cost of acquisition, having all the elements in mind that I could bring to bear on the subject. I considered all the testimony I had before me, and judged partly from that and partly from my own observation, I presume.

Item 34, p. 20 Defts.' Ex. 15, frontage west side Lake St., north line Ely lot to Baraga Ave., $15 per foot. Rejected Riggs' value of $30, because the configuration of ground depreciated the value; the ground rises very abruptly, and must be excavated to be occupied for any purpose. It would not be considered for the purpose of residences.

In reducing the value of Riggs', Asire and Robertson 50% on this I endeavored to carry out the sense of proportion between values, meaning to consider the depths, availability, and all the elements that go to make up the value of a tract; some of the land is valuable because of its use for a variety of purposes, and at other points there are fewer purposes for which it could be used, therefore there is a proportion between the two, in the variety of applications of industries or other earning organizations. On 34*a*, there is a very shallow frontage. The upper end is used for a park; there
733 would be a very small demand for that tract for anything but railroad purposes.

All of the land is for railroad purposes; I don't estimate the value for that purpose. All the land occupied is valuable for some purpose; to take out a part of the track would destroy the continuity of the rails, consequently one foot is just as valuable for some purposes as any other foot. Where there is a narrow strip of land between a high bluff and just room enough for a yard, with no other land in the vicinity that can be put to use as a yard, that land has a special value for railroad purposes; I never gave it such value, because it cannot be estimated by anybody that I know of, e. g. there is no price railroad terminals could afford to accept, if continuing in business.

If they were deprived of their terminals and could not acquire others, there is no price they could accept if they expected to continue in business; there are very few pieces of land that I could estimate in dollars and cents as value to the railroad. In some cases they would vary the route, and in others they could not, that gives the latter a special value, which I cannot estimate in dollars and

cents. Yes, I think I can go into Marquette and estimate the value of property, without finding the holding or sales value. I cannot, however, estimate in money the special value for railroad use. I can see a difference in the value to the railroad and the value of the land.

Q. Is there none of this land that had a special value, this land along that lake front, because it was the only desirable practi-
734 cal route into the city of Marquette, and very limited in extent, so that the owner would be justified in charging higher price for it than he would where there was a vast quantity of it, and the railroad would have to pay a higher price?

A. I think we have considered those elements.

Q. You have considered all of these elements?

A. In all this valuation.

Item 35, Defts.' Ex. 15, frontage west side Lake St., Jackson to Mesnard, 565 feet, value by plaintiff's witnesses, $20 per foot, by Hansel $10; that is my judgment of the value.

Item 36, Defts.' Ex. 15, frontage west side Lake St., South of Hampton St., 170 feet. In valuing this, I applied same considerations as to all other places.

Item 37, 46 50-foot lots, between Mesnard and Hampton Sts., present a problem of valuing city property. I estimated the value by the surrounding conditions, and evidences of development or lack of demand, whichever seemed to exist. I spent more than 2.5 days' time in Marquette, and, besides that, had evidence through my assistants, through the testimony, and the observation of the ground; in that valuation I was somewhat influenced by the testimony. I fixed those values myself, in consultation with my assistants.

Item 38, 12 50-foot lots; $200 was my estimate of the value of that group.

735 Item 41, frontage on Front St., Baraga to Washington St., depot grounds, 343 feet; the Front St. end of the 40 feet thoroughfare is also here rejected, leaving 303 feet. For the remaining 303 feet, my value of $400 per foot is my opinion, after studying all the conditions and data and such evidence as I had.

Item 42, 184 feet frontage on Front St., south of Baraga; I based my opinion there upon the character of the ground, the buildings opposite and the conditions surrounding; it was my judgment, based on my knowledge of the location, together with such use as I made of the Riggs' valuation and the testimony of witnesses furnished me.

Item 44, 14,000 sq. feet in Alley east of Third St. Riggs' valued 14,608 sq. feet. Our areas were checked. I fixed price and arrived at it in the same manner as the last preceding. Also valued all property frontage on business streets and where lots are involved in the same way.

In reducing Riggs' price on 14,000 feet from $2 to $1.50 per square foot, I have no recollection of the reasons, except the configuration of the piece, it being an alley, influenced me in placing $1.50, which is fairly high; I did that in spite of all testimony. That is a situation that is entirely a matter of opinion; it is an alley, back of lots fronting on Washington and Main Sts.; there is no sale value

for that kind of property, and no demand for it except for railroad purposes.

736 You could only determine what the owners on Washington St. would be willing to buy at from an actual offer. To get at a precise value we would have to assume that railroad was not there, that town was same size, that there was demand for the property on each side, and then go to each owner and find out exactly what he would sell for. If it were attached to the rear of lots on Washington St. I should expect, on condemnation for railroad purposes, to get it at the price fixed; $1.50 a square foot is no small sum of money.

Item 45, Defts.' Ex. 15, equivalent of Riggs' 100 foot frontage on Baraga Ave.

Item 46, equivalent of Riggs' 150 foot frontage on Spring St.

Item 47, Third to Fifth Sts., 3.5 acres, at $3,000 per acre; the same as Riggs' 21 lots Third to Fifth Sts.

Item 48, Fifth to Park Sts., shop grounds, 15.5 acres at $2,000 an acre, is same as Riggs' 60 lots, shop grounds, Fifth to Park Sts., $500 per lot; agreed with Riggs on latter two items, on same theory that in other cases I could not agree with him, basing my values upon conditions and investigation.

Item 49, corresponds with Riggs' 34 and 36 acre tracts south and west of Nester's Add.

As to Riggs', Robertson's and Asire's value of the tracts aggregating 70 acres at $900 and $1,000, I felt that if I was correct in throwing out the considerable area on account of non-railroad use, I

737 could not consider any estimate on the whole. I didn't come to the conclusion that the whole was worth more than they fixed on it; for railroad uses, the excluded area between the tracks would be worth as much as the land that had tracks on it. It would not be valueless for other uses; it would be an excellent place for an industry, if there was any demand. The piece on the south is more desirable for dwellings than for any other use; it is hardly accessible to the railroad, and is good high ground, suitable for cheap dwellings. The existence of the yard parallel to, and within 200 feet of, Washington St. lessens value of land there for high class dwellings.

Item 52, north line right of way to city limits of Marquette, 6.8 acres, $200 per acre; this is my opinion of the value.

Item 54, south line right of way south of Division St., to north line S. W. ¼, of S. W. ¼, Sec. 26. 4.1 acres as against Riggs' 16 acres; our value ($200) is the same as Riggs' for the acres included. Our value includes nothing but the 100 foot strip.

We didn't adopt Riggs' value; I didn't disagree with him, because I didn't consider the whole area, but only what we were appraising.

(Strip, about 1,400 feet, from No. 54, on Ex. 20, to platted portion of city, omitted from Hansel valuation; it is something between 3 and 4 acres.)

738 Item 55, 96.4 acres: the value on that strip of land varied; I estimated the average at $75. We were over that part of the line on other occasions than our first trip. The character of

the land is easily observable, whether tillable or timber, underbrush or swamp; it is easy to see from the end of a train, oftentimes easier. Land untillable in present condition, lying close to a town of 13,000 people, may have a value beyond that of tillable land further away. This is between Marquette, Eagle Mills and Negaunee. The notes indicate this is on the side hill, not suitable for farming, and very cheap charactetr of land; I consider $75 an acre high for it.

Item 53, north line of city limits of Marquette to mile post 163; 90.3 acres, as against Riggs' 79 acres.

Item 56, north line from mile post 163 to mile post 164 plus, 4200 feet, and south line, mile post 9 to mile post 3, acreage 86.5, divided into two tracts, one 46.5 acres and another 40 acres. (Witness indicated division between these two tracts, one being at $1000 and the other at $3,000 per acre by pencil line on Defts.' Ex. 21, Hansel.) The division is approximate, as it could not be absolutely correct; we could not go a certain distance with an acre at $1,000, and then suddenly change to a value of $3,000 an acre. The intention was to separate the potential ore values from the developed and operated ore values; the line is somewhat of an imaginary division between the two qualities of land, but generally shows the division. I am putting the black line on from
739 memory of the situation.

I instructed Mr. Tombo to get together all the information he could on the subject of these land values, after which we consulted together, and I determined that that would be a fair division between the developed and undeveloped ore bodies; to determine that with any accuracy would require surveys of the ore bodies, which I did not do. In giving these values I considered how much I could get into that territory for, in the same general location, if I could get in at all. It might be that, with value of the land as held by the owners, it would be absolutely prohibitive to build a railroad in there.

It would depend greatly upon the attitude of the owners of the land, which I could not determine; if they had to pay over $3,000, it would cause great hesitancy in building there at all.

There are so many conditions affecting value there that I don't understand myself, I frankly say it, that I haven't found a definite explanation of, nor have I seen any condemnation proceedings or court proceedings on this area that we have under consideration, that it was in my mind a matter of judgment as to the value or the amount we would have to pay for the surface; I didn't attempt to estimate the value of the ore underneath at all.

I determined it to the best of my ability; spent but a short time on this investigation personally, probably not more than a day on the ground, and going and coming. We stopped at Negaunee and Ishpeming, went slowly over the roadbed, and over the sta-
740 tion grounds; was not on old line at all, but could see it full of cars, and got a general view of the surface; didn't attempt any estimate of values under ground, but I had all the information available at the time.

I didn't intend to say that anything above $3,000 would be prohibitive, but that it is quite possible that the conditions of ownership could be such that the price you would have to pay would be prohibitive. We had the testimony of Mr. Riggs and I saw testimony giving results of condemnation proceedings in the immediate vicinity. I observed that Belden and Young put a higher value than Riggs, and supported their judgment by accounts of actual purchases and sales. I don't recall having before me the prices actually paid for the new line, 2.6 miles; I presume that we did. I don't think it would be right to value the land at less than cost to the railroad, unless they had intentionally paid more than they could have gotten it for.

I think if a piece of property is purchased in good faith, and with reasonable intelligence, as I presume this piece was, that the company would be perfectly justified in carrying it in its assets at what it cost them, but, as a general principle, I think we should hesitate to formulate any theory on the subject, because conditions may change very quickly, and, if you care to have me, I will illustrate.

I cannot give the name of any person of whom I or my assistant inquired about these values. My assistant expressed an opin-
741 ion as to these values to me; I always ask. I cannot say whether I adopted his opinion or my own; if I had formed an opinion in advance, there would not be any object in consulting. The conclusions I came to are my own.

Item 57, Riggs, $3,500 per acre; Hansel, $4,000. I think Riggs' figures were as accurate as could be determined under all conflicting conditions, and, because of elimination of a certain area further from center of Negaunee, the balance would be at a higher average per acre. Having adopted Riggs' basic value of $3,500, the rejection of 5 acres induced a higher average value for the balance, because portions of it would be nearer the heart of the city. I gave the testimony of Belden such consideration as I thought it worth.

Item 58, N. line, from mile post 167, 8,700 feet west, within limits Negaunee and Ishpeming, right of way for single track, considered equivalent to a width of 50 feet. This item corresponds to Riggs' item of track rights Negaunee, main line 8,700 feet. On an assumed width of 50 feet, part of this description valued at $4,000 and part at $3,000, producing a value of $34,000, against Riggs' $43,500.

Item 59, Teal Lake branch to Negaunee, 7,300 feet; Riggs' value adopted.

Item 60, track rights, Palmer branch to Milwaukee mine, 9,200 feet, valued at $1.50 per lineal foot.

Item 61, S. line in Ishpeming and Negaunee, mile post 167 W. to center line, Sec. 11, Riggs valued 12.77 acres at $1,000
742 per acre; I valued 12.4 acres at $3,000 per acre, on the theory of $3,000 per acre in developed mineral territory; we believed it such and so increased it to be consistent.

Item 62, 38.3 acres; 8.3 acres from west end of item or Ishpeming limits at $1,000 per acre, and balance, 30 acres east toward Ishpem-

ing and Negaunee, at $3,000 per acre; arrived at this in the same way as other mining values.

Item 63, 9.6 acres, at $3,000; Riggs' valued 9 acres at $3,000.

Item 65, 7 acres at $3,000; Riggs' value, $3,500. Arrived at value on same theory as other developed mineral lands, giving same value to all land where we believed mineral might be said to exist, except where we were higher on account of the added value in the city. Where mineral value was the only element, $3,000 was our limit; $1,000 was where there was a lesser possibility of iron ore.

Item 64, 5000 feet in Ishpeming, N. line of Sec. 10, to center of line Sec. 9, $3,000 feet at $30 and 2,000 feet at $5; Riggs valued entire at $30; I made distinction in price because I considered east end to be of higher value; the 3,000 feet ends between sections 9 and 10. I took into consideration all elements including minerals and gave a value to the 3,000 feet, because of possibility of land being underlaid with iron ore.

Under 2,000 feet possibility of iron ore also; the east end was of higher value on surface, being in more valuable quarter of Ishpeming and not because of greater mineral rights.

743 Item 68, Mary Charlotte Branch; Hansel 3 acres, value $100; Riggs 3.2. This appeared to be in active mining district. Values subsequently increased to $2,000 per acre. Portion of Palmer Branch also appeared to be in active and potential mining district. (Value subsequently changed to $2,000 an acre.) On consultation with my assistant I fixed values on Michigamme, Republic and Champion station grounds and on Champion mine branch. At Humboldt, I allowed 4 acres at $100.

I remember the 1,500 feet of water front at Houghton. South Shore road goes into Houghton on the best line and easiest entrance from east; and it must have yards and terminals on water front. If riparian rights in use, it would be worth more than I have fixed. All of the land along the 1,500 feet is in use; I excluded part of its value in appurtenant riparian rights and I have excluded riparian rights for the reason alone that they have not been developed into railroad use or any other use. It could be sold or occupied by others under lease to bring in an income, it has not been so done. You are not using the riparian property, which is a mere right attaching to the land because of its location.

You are using all of the fast land, but not that under water, which you have the right to use. I almost always, in my experience, separate the value of the land under water from the value of the fast land; it is generally separated. The upland, fast land was necessary for railroad use; frequently that land is bought separate from its riparian rights. I don't know what you could have done there; it is the rule, rather than the exception, where the values are high.

744 In a sense, I have not allowed the value of mineral rights, because, if I had, we might have gone to such a sum as to be prohibitive; I don't know what the mineral values are. I think the cost of the getting onto the surface would be enhanced, because of the value of the mineral underneath. With the riparian rights, you still have them, you own them. In the other case, you don't

buy them. I don't assume the responsibility of a basic figure used by me for right of way, but do for the multiplier of 2.

The population figures in Defts.' Ex. 15, were taken from 1910 census; Baraga, 100 (p. 10) is probably a misprint for 1000. The term "present worth", as used on page 5, defts.' Ex. 15 means a reproduction cost of the segregated items new, less a percentage to represent present condition, but not commercial nor fair taxable or sale value.

As far as I was engaged in the problem, it was to ascertain a correct inventory of the parts, including lands, structures and equipment, not including intangible value, cost of developing business, or cost as a going concern, or franchise or good will value. My results do not purport to give any opinion of fair value of the property as a whole for use as a transportation machine in production of ton and passenger miles.

In my profession, there has grown up in recent years, especially since the Michigan appraisal of 1900, a quite well established
745 practice of getting at reproduction cost; much has been done toward accomplishing the definition of value applied to various conditions for various purposes. Some things are now reasonably settled which were then subject to further consideration, doubt and dispute, but many problems remain about which there is difference of opinion in my profession, and among economists, publicists and lawyers. Most of the differences are referable to the underlying conception of "value", the particular definition for that term as applied to the particular purpose of the valuation.

The value of the use of an instrumentality for the performance of its function, may be, and frequently is, very much more than its sale value or its taxable value. It may be either below or above.

The terms "present worth", "present value", and the like, are indefinitive. We must consider the matters heretofore refer-ed to in this cross examination to properly weigh the value of any reproduction figure, however accurately made. Usually, and generally speaking, the value of the use of a thing for the performance of the function for which it is created is greater than its second-hand value. That would be true of locomotives, cars and movables on railroads generally, except that there are periods of depression and of affluence which affect conditions, depending largely on the period of time through which it has been operated and accumulated friendships, interchange of business and contracts of advantage.
746 As an instrument of commerce, a railroad well located and built in obedience to a reasonable public demand, economically constructed and properly maintained, is usually worth more than the cost of its parts new.

It is possible to conceive of situations where the reproduction new cost might exceed its fair value; want of necessity, or want of economy in building, might show the other side of that truth. In seeking to establish a reproduction cost new, the first conception indulged is, that the property to be appraised does not exist as a railroad or part of a railroad, but has existed, and that it is to be created, replaced or reproduced; that is, that the right of way

is unimproved for railway purposes, but that the community, contiguous lands and properties are in precisely the same condition as now. The change conceived is the obliteration of the railroad, except that the land is presumed to be in the same condition and devoted to the same uses as the abutting land.

Further on the same subject indicating that in the problem the land is to be treated as being of the same character and condition as the adjacent areas are at present.

Original cost or condition of right of way is ignored in getting at reproduction new, figure.

Generally speaking, the conception is that the particular property, of the same general design in its lands, improvements and moveable parts, is to be reproduced, except that, if an equal or better design can be constructed at smaller cost, it should be so considered.

747 That principal I applied sparingly; it should be applied with great care, to avoid speculation and conjecture. The grades, curvature, alignment, rolling stock and structures were taken as they are, as a rule.

After organization of corporation, the first thing to be thought of is, where you will get the money to build; in reproduction problems, that ought to be thought of—how much you will need, how you will get it, and what you will have to pay for it. It is proper to take into account fair and reasonable cost of financing, in getting reproduction figure.

That includes interest on idle money during construction, which is a proper charge. It is now well settled in my profession that whatever would have to be reasonably paid ought to be allowed in this kind of an estimate of reproduction cost. The amounts to be paid depend upon the prospects of the company, condition of money market, etc., but the prospects of the property would be principal factor. The prospects are shown more accurately under the conditions we are trying to act under than they showed at the time of the conception of the scheme.

The element of certainty of success would tend to decrease the cost of money; a certainty of failure, more or less well grounded, would prohibit the enterprise. I assumed that if the property here was to be bonded at 5%, bonds could be sold on 6% basis. I assumed that the money could be borrowed and that the railroad was going to be built.

748 I didn't review the history of the past, or undertake to form an opinion as to whether it could get money on a 6% basis or at all. I assumed that if it could not get it at 6% it could not get it.

Q. Now let us assume a railroad in any part of the western country, with the mileage and trackage that this has, or assume the prospectus of the creation of one that would cost $15,500,000, that is about your reproduction new figure, and an annual interest charge of $913,700, and assume further that in 25 years of its history it never earned that much, or could not, its net earnings never amounted to the interest, and that of recent years it averaged about $500,000; on that as-

sumption, and for general application, you would not say that the money needed to produce or reproduce it, could not be obtained.

A. If a property to cost $15,000,000 was shown to earn only $500,000, I doubt if there would be any possibility of financing it at any rate of interest; for the further reason, that the earnings estimated are insufficient to support the capital, and the estimated earnings are generally as high as the imagination of the promotors can fix them, and the financiers generally underestimate the income rather than overestimate it.

On property like South Shore, with mileage planned, and prospect of earning less than an interest charge of $900,000 annually, you could not obtain the money on such a prospectus at 6%. In some cases, there is a value, to other properties which it joins, or which operate it, that would make it desirable to construct and oper-
749 ate at a loss. That was not the consideration of my reproduction estimate, which was that it would be built as an independent property and that the ordinary interest charge which would warrant its being built as an independent property, would not exceed a 6% basis. To get the money at 6%, its prospective earnings should be twice its interest, that is $1,800,000 per annum above operating expenses and taxes.

Assuming the South Shore road in Michigan, well located and maintained and economically operated, and built in obedience to a reasonable public demand, and that its net earnings, after operating expenses and taxes, for a score of years, has averaged less than $900,000 per year, in my opinion its earnings are too low, either from want of business or low rates. The description of territory (pp. 10-15, of Deft.s' Ex. 15) would indicate that there must be relatively little interstate passenger traffic on lines of South Shore in Michigan, as compared with railroads of New Jersey, Southern Michigan, and Michigan as a whole. (Subject to objection that the answer involves an examination of traffic conditions, which witness has not made.) Had I been studying the possibilities of business on the line, I should have gone into the question of what traffic was probably tributary to the line. I have only indicated the character of the villages and hamlets, and given the population in the various counties, to indicate the density of settlements as affecting the
750 value of the land to be acquired.

If the population indicated on Deft.s' Ex. 15, (pp. 10-15) included all people naturally tributary to the line, there would be a sparse passenger traffic. The haul would be short, though that is often an advantage; the haul would be greater per inhabitant than in a densely populated section. Upon a prospectus describing that territory and this property with a 2¢ passenger rate, I would not loan $15,000,000 at 5%, if it were only to haul passengers; I would not advocate such a loan with freight and interstate passenger business, the total of which never amounted to the interest at $900,000 a year on the average.

Q. Would you not also think that on those conditions which I have assumed in that question, supplemented by what you observed, two cents per mile for adult passengers is too low in that territory to

justify the creation of that property or to make it possible to create it on the hypothesis that you could borrow and get fifteen and a half millions at six per cent?

Mr. Wykes: I renew all the objections previously made.

A. I understand the question, and in answer I will say that I have not studied the amount of business; in some sections people travel oftener than other sections, and I don't think I have sufficient facts either to accept—to advocate or turn down such a proposition; I don't think I have had enough facts before me to answer either way.

751 Assuming that this property has not averaged for 20 years, over taxes and operating expenses, the interest charge of $900,000 per year, and assuming my description of the territory to be true, 2¢ passenger rates would not enable the borrowing of money to reproduce the property, if that was all the business of the company. Assuming that was not all the business, but that the total business on the average for 20 years would not pay the interest charge, the case being entirely suppositious; I don't think you could get the money.

Any project that had to bear a heavier interest charge than 6% could not be prosecuted. If the charges on that property have not for 10 years averaged enough to pay the interest charge, which I have assumed to be necessary, as low as 6% (the case being suppositious) the charges or aggregate net earnings are such that such a piece of railroad, with contemplated or assured earnings which were below 6% could not be financed.

To procure the money on 6% basis, the earnings in prospect ought to be twice the interest charge; if they were less than that, I don't think the money could be obtained. I don't think that, unless by a fair and reasonable prospect it appeared that a property such as this would earn net above the operating expenses and taxes $1,800,000 per year on the average, taking good and bad together, the money could be procured to built it.

752 A schedule of rates which, taken on the average in good times and bad, does not give reasonable assurance of net earnings of twice the interest charge or reproduction cost new at 6% are too low, in my opinion. The trend of feeling is that way; on going concerns that can borrow below 4%, I have considered that an annuity of 5.5% and taxes should be allowed before intangible value would be considered.

If we didn't believe the earnings could exceed $500,000 average, I feel that on such a statement it could not be financed without more business or higher rates, or both. On 5% bonds selling at 85, $15,000,000 of money would be raised by about $18,000,000 par value of bonds; this would require a 40 or 50 year bond. It is easier to sell a 5% bond on a 6% basis than a 6% bond at par.

After determining interest rate, we must determine length of time required to reproduce the plant. This is a matter of judgment, and, in some cases, of great difficulty. Frequently, the interest at half the rate for the full time is estimated as necessary; that is the general

practice of the past. I have analyzed it more closely, and taken it item by item and calculated the time that the money would be used, in the belief that the practice has been far from accurate.

I did not apply any supposed net earnings during construction to interest account, but figured that when portions of the line are finished the interest charge would cease. Operation of a part during construction would be attended with greater overhead and administration charge on a few miles than on many.

753 I don't think the operation of a considerable division of the road when completed would render the carrying of business on the completed part more expensive, or hinder the construction operations. The completion of the road enables the company to earn from outside business and to handle its own materials better than if it had to carry it by an inferior transportation facility. In any particular reconstruction problem, it is assumed that company will handle its own material over completed parts, but they do not carry it free of charge. To carry passengers and freight to intermediate points contemporaneously with the haul of that material could not be attended with greater cost than if the road were completed, because the demand of the public for service would not equal the capacity of the road. They could not expect to handle or secure as much business in the beginning as ultimately.

Ultimately you would get the cost from it or more, depending on volume and conditions of operation. I think it was not proper to subtract anything from interest charge on account of the earnings from a part during the 2.5 years I assumed necessary; each particular property presents its own problem. Interest should be allowed on the overhead items which occur; if incidental expenses don't occur, that is an over-calculation of interest charge.

A variation of allowance for interest analyzed on my basis would occur between appraisers of equal capacity and character on account of the differences of time and of rate charged. It is conceiva-

754 ble that discounts, commissions and interest might substantially exceed 6%, but a going concern in many cases can get money at 4% at par today; e. g. Pennsylvania Railroad. I think it would be absurd to calculate the interest here on that theory.

To get at the cost of obtaining right of way, you would have to deal with individual owners; you assume the right of way runs through their land and severs it. The meaning of severance damages is understood; we took it into account in making this appraisal. The depreciation of abutting lands not taken is always involved in the cost of acquisition; that amount is difficult of ascertainment, as in some cases the railroad appreciates and in other cases depreciates value in estimate of owners.

Straight through a 40 acre tract (Government survey), a 100 foot right of way would equal 3 acres. The amount of damage to that 40 would be affected by the manner of crossing it, its topography and the location of streams and highways; each tract presents its own problem in getting at the severance damages. It might in many cases be cheaper to buy the whole lot, this is frequently done, and is good business.

The value of the use of the land in a street is, I think, just as great as if the fee title was in the railroad company; in getting at reproduction cost I didn't give it any value, I didn't allow anything for the land or rights in it. Where revocable rights, not likely to be revoked, are used, they have a value, to include which would be speculation, though perhaps it ought to be taken into consideration.

755 Page 18*a*, Defts.' Ex. 15, Hansel's assumption was the track was wholly within street, and no value for right of way there was used; if third party owned yellow strip between Lake St. and the lake, damages would have to be paid for cutting off his street front if they existed; it may be an advantage, ordinarily it would be a damage.

If it developed that buildings not requiring railroad facilities were there, there would be considerable abutting damages. Usually, a railroad running within 10 feet of the shore line would enhance the value; there is no rule. In many cities, it would appreciate the value if they could have a railroad along the water's edge. In case one owner owned a large tract along the shore line of a harbor, it would depend on the shape of the ground and depth of water as to whether he would be damaged or benefited.

If the riparian rights, when the railroad came, were of great value to the owner of all the shore on the harbor, and the railroad took all the land, the riparian rights would not of necessity be impaired; they might be materially enhanced. Whether I would allow for damages to the riparian rights, I would have to decide; there is no precedent for that. If there was damage, I would certainly allow it.

I considered that all cost to acquire certain tracts would be as shown in the schedule. Where the railroad company was not using riparian rights, I allowed nothing for them, meaning I did not itemize or schedule them as an asset or cost of construction; that is my uniform rule.

756 In the appraisal of all right of way, including Houghton station, I included damages, if in my judgment there was any damage. To take all the fast land of the 1,500 feet on Portage Lake at Houghton would probably impair the value of the riparian rights, and to that extent it ought to be allowed; had that been developed, I believe it should have had a much greater value than Riggs gave.

The value of use, by carrier, of land in vacated streets and donated lands is as great as though paid for. In prospectus to get the money I would not say property was of less value because using vacated streets; this involves definition of value, whether cost, use or sale value. The cost value is less, due to things not paid for, but not the useable or sales values.

There is a good deal of uncertainty in getting at the amounts of legal expenses in a reproduction problem. They cannot be inventoried; they can only be appraised. By reason of this uncertainty, I added a contingency of 10%. The same is true of organization, administration and interest, to which I have added a contingency.

The expression "contingency," as used in this schedule can be defined as covering uncertain items that may or may not arise. There has been much discussion about the allowance of anything for contingencies. If the contingencies arising are properly allowed, the

amount charged is just as much of an investment in the property as anything else. In such an estimate as this, they are absolutely essential, and it is as legitimate as the item for locomotive engines.

757 The contingency item, in estimating an existing property, differs from that where property is not constructed, but there are contingencies in all cases which I think should be provided for. The percentage is variable with the cost of the elements to which applied. It is now the practically well settled practice of my profession to allow contingencies, and there is no doubt about its propriety in my profession. The percent has to be determined with each particular condition.

The correct definition of the things which justify this allowance is: "uncertainty," "unknown conditions," "those which have not been, and cannot reasonably be ascertained or foreseen."

Upon such an inspection as was made by me on South Shore property, it is difficult to ascertain, without soundings, the yardage actually hauled onto some of the places; in those cases we gave 100% more than was shown on the surface. Ascertaining by measurement, the quantity might be increased or diminished; in such cases the quantity was small. It could only be determined by doing the work; the profile is not reliable, mathematically, because the earth may sink away. I would not say that the measurement quantities are always more rather than less, my instructions have always been that the excess of quantity is always given over that which would appear in the prism of a profile, or even the prism as found on the ground. In case of a yard in existence 50 or 75 years, there is no way of determining what the surface of that yard was before filled in.

758 The yardage in an old road cannot be found precisely, and one reason is you cannot tell how much has sunk into the surface. The density of the embankment increases with time; that could not be produced except by time. Engineers allow for the settling of the surface under the weight, including that settlement in the prism by requiring a certain percentage of elevation to be put in the bank over what is ultimately expected to be there. That percentage is understood to cover shrinkage and settlement.

An old roadbed is cheaper to maintain and worth more to use from every point of view than a new one. It is recognized uniformly, the world over, by railroad engineers that the roadbed appreciates in value with the lapse of time and reasonable maintenance.

Assuming that a road bed was new at X number of yards, that after being properly maintained for a quarter of a century it still had X number of yards, but in the meantime had become solidified, stable and steadfast, vegetation had grown upon its banks, the slopes of the cuts had become fixed, the road had ceased to settle, slide or sink, it is worth more and is a better tool of operation.

By adding a percentage to the actual quantity that is estimated you can, as far as intelligence will permit, cover that item by yardage, but not in stability. The knitting together, in steadfastness, is one thing, yardage is another. You cannot produce the former except during the same period of time and under the same conditions. Nothing was allowed for that appreciation, except in an increase of quantities. The appreciation would be shown in the commer-

759 cial value of the road. Nothing was allowed in my figure to show the value or quality of solidity of the bank.

Railroad men recognize that the old roadbed, reasonably well maintained, is of much greater value than a new one of the same kind. That can be gotten at by the difference in cost of upkeep. Safety, dust, comfort and use would all be elements; I do not know how to estimate that. A new roadbed is more apt to wash out than an old one, accidents are apt to happen from cloud bursts or heavy rains and the cost of maintenance is less in the old road. Speaking generally, there is a very large appreciation of value in the roadbed, due to proper maintenance and lapse of time, which cannot be reflected in a reproduction new estimate. This road bed is a more economical and safer operating tool than a new one. The extent of that I did not estimate.

Mr. Wykes: It doesn't involve any expenditure, you don't claim that it involves any expenditure other than would be reflected in the cost of reproduction, as Mr. Hansel has fixed it.

Mr. Butler: I am one of those fellows that thinks that the thing that I have got is of the same value, whether it involved expenditure or not.

Mr. Wykes: I am not questioning you on that.

Mr. Eldredge: I shall never give you a present because you will never appreciate it unless you paid for it.

760 In work done by contract, the contractor estimates a profit and assumes the liability for contingencies. Unit prices here are based on contract work; I didn't base them on actual cost. Loss by storms and weather are included in the unit prices. The percentage added for contingency is intended to include all contingencies of every kind whatsoever. My contingencies do not allow for damages by a heavy rain before road completed by contractor and turned over.

I cannot say how much I allowed for contingencies for grading in unit prices; unit price was intended to cover the cost of that work, including the contractor's profit. The experience in fixing unit prices includes all conditions of bad weather, etc. I allowed 10% in the contingency item on grading.

In addition to the 10% of quantities allowed, 10% again, on the total, is sufficient to cover the contingency item of grading, after the contractor has turned it over to the company. If it was assumed that the company was to do the work, the contingency item would not be larger. If construction is to be done by company, the unit prices would be smaller than the ones I took—at least 10%.

We have added much more than 10% in quantities; in many places, where holes and soft ground are indicated on the profiles, 100% was added to quantities, and the additional 10% besides; the blanket 10% was on account of possible allowances that should have been made in quantities or prices. It is as proper to allow contingencies for unit prices as for quantity.

Delays in receiving material may delay the work of construction, or make it necessary to put in a temporary bridge; that ought

761 to be covered in unit prices. In a way, you can foresee these things by experience. If we do not encounter those difficulties, the profit is greater. I think delays in traffic ought to be included in unit prices, not in contingencies, as should loss of men's time by bad weather. If the company did its own work, there would be no unit price, though I would estimate the graduation at contractor's price. The estimate would be the same in all respects as to quantities. The possibilities of strikes, and all contingencies of every kind into which labor entered, includng track laying, I would include in unit price, as I would, also, demurrage on material.

The delay, or loss, adding to the cost of construction, would fall on the contractor, if there is one; nothing would be allowed to contractor for that, unless otherwise specified in the contract. The item of cost of material yards would fall probably under contingencies. Assuming no contract, it would fall in the unit price, assuming a contract, it would fall there too; so it would be in the unit price either way. That would apply to all the elements of track laying; also, the engineer would have an item for an estimate of the cost of the material yard; I didn't. I made no distribution of the cost of the yard to any items. No allowance in contingencies was made, though, if found to be an increase, it is properly a contingency. Personal injuries, accidents and insurance would be contingencies, except it be a contract. The contractor generally bears all the losses. There is chance of personal injury in track laying operations; there should be no contingency, as I think the price given is ample. In the case of

762 the contractor being the railroad itself the difference between unit prices and the contractor's prices provides for the contingency. The cost of reproduction ought to be the same, whether there is a contractor or not. If the railroad company did the work, the engineer's duty would be to estimate the cost in advance; the classification of accounts would be of the same names and in the same form as here. You would have an item of contingency on such an estimate, for the company to do its own work by.

In case of construction by the railroad, the contingency item would be carried in the difference between the unit prices and the total estimated cost. It would be included in the difference between what I would have to pay a contractor to do the work and the total estimate of the work. I would include the contractor's profit in my estimate, though I had no contract, and all those contingencies would fall against the contractor's profit. The possibility of personal injuries would affect the total of the contingencies. My estimate for contingencies, being a little more than 3% of the total estimate, as a great deal of the total is for land, does not include anything for personal injuries, strikes, mistake of plans or change of method by engineers, for demurrage, for delay by transportation, for difficulty in getting or keeping labor, or anything on account of the uncertainty or appraisal of land; that is covered by unit prices, and, in case of land, the contingency is covered by the added 100%.

I intended to make the real estate price so high that no contingency would be necessary. The quantity is not uncertain in

763 the land. Contingencies are allowed to cover uncertainties in price as well as in quantity. Contingencies for strikes, de-

murrage, loss on account of controversies between engineer and contractor, material yards, difficulty in securing labor and uncertainty of unit prices is included in contractor's price, which I always assume in figuring. I added 10% for contingencies to each of the items, 3 Grading, 16 Sidetracks, 20 Shop Machinery and Tools, 29 Engineering, 38 Legal Expenses, 39 Organization and General, 40 Interest and Taxes, 41 Fixtures and Furniture, 42 Stores and Supplies.

No one would expect the same percentage to apply to each of these items; it could not be precise. The item of contingency cannot be the result of analysis; it is a matter of judgment, based on experience. You would not include a grading price high enough to cover the 10% here allowed, as that contingency covers quantity as well as price. The same result would be obtained by applying it direct, so much in quantity and so much in price. I think 10% added in Cooley appraisal for contingencies to the whole; at that time engineers did not attempt to analyze.

They had not added 100% and 25% to quantities that I have added, so they are hardly comparable. If I analyze closely, the contingencies diminish; I don't know as I know of the reproduction of a railroad by any state or railroad engineer where the percentage of contingency to the total was as low as this. For a road to be built, I should estimate higher; sometimes I go as high as 15%, I think the practice is from 10% up. Of course, they are not in a position to analyze as closely as I was in this case.

764 It is frequently necessary, on account of indeterminate factors, to allow higher percentages. I don't know, as less than the 4% on total allowed by me is much lower than customary or usual for new work, or for estimate of C. O. R. I have studied percentages allowed for contingencies; as high as 10% has been allowed by many engineers for specific purposes; e. g. cost of reproduction of a railroad. I cannot tell what percentage of the total has been allowed in state estimates and by railroad engineers. There is no common practice on the subject of reproduction; we are in embryo state on that.

I don't know of any of the railroads that you speak of that have actually surveyed the line, and therefore the contingencies must be higher, and under certain conditions of unit prices contingencies should be higher or lower.

In New Jersey, I included contingencies—called it overhead charges, interest, and so on; that was everything; we included engineering, interest, lawyers and organization at 7%; it was too low to get fair reproduction value. It would be too low here, because I have allowed 16.4% on those same items.

There is a customary practice in engineers' offices as to contingencies for work to be done; the minimum on railroad work is 10% of the total, covering everything.

Q. Now, the justification then for a lower percentage here lies in the fact that the work exists, a greater familiarity and ability to analyze the costs, than would be in case it did not exist?

765 A. That is the controlling factor, yes.

In reproduction of this railroad I have assumed completion of the whole in 2.5 years from time construction was begun on

any particular division. Assuming any division could be concluded within 2.5 years, I assumed as divisions from St. Ignace to Marquette, 155 miles, another from Marquette to State Line and another from Nestoria to Houghton, each taking 2.5 years, whether done contemporaneously or not. I would have material yards at several points, as stated in Defts.' Ex. 15. Assuming the existence of other railroads, I don't think it would take more than 2.5 years for entire road to be built at the same time. Some parts of it could be constructed in better time except for soft or swamp ground. The cost of the legal end, in the preliminary work, before acquisition of the land, would take over 2.5 years, perhaps I ought to have added another six months on that item.

At the end of 2.5 years, you would not have as good a roadbed as now, because it has to have age to season it; that cannot be included in reproduction. If the operation is successful, as to that item, reproduction estimate is always necessarily less than actual value as an operating tool. As an instrument of commerce, the roadbed solidifies by time, and operation over it is better. Much of the roadbed in flat, soft country is made of gravel hauled from pit over a long period of years. This is done at an increased cost over reproduction
766 new estimate. It is impossible to say when construction ends and operation begins.

A considerable amount of yardage must be moved after contractor finishes and during the first few years of operation, to take care of settlement, shrinkage, maintaining shoulders, etc. It is difficult to consider that item under a percentage, as height of bank has much to do with it. As to unit prices, the fact that quantities were put in piecemeal is not considered in reproduction estimate; as to quantities, an effort has been made to cover that point. I aim to get the quantities that were there, and assumed that they were put there as part of the original grading. As a practical matter, until you have sod on the bank, you must keep renewing it.

In the existing road, the grades have been corrected, cuts filled in, high bluffs cut down and curvature and alignment changed, frequently resulting in abandoned property, which reproduction estimate does not reflect. Reproduction estimate does not reflect added cost due to piecemeal construction. Generally speaking, the yardage put on after operation of the line commenced would cost more to get it there than if it had been put on all at once. This is due to slow orders and all that. On the other hand, we must remember that, with a track there to haul our material, in many instances, it would be done cheaper. Generally it would be dearer, but, if you go into as much as half or a quarter, I don't think it would hold, when a small amount has been added, it is a great deal higher; the smaller the quantity, the greater the increase of unit cost; that increased unit cost, might increase average substantially.

767 Have made a study of the progress of cost of grading per yard during the past 50 years; it doesn't result in giving me any information. I have consulted contractors, in some cases they are higher, but increased efficiency in tools, and the knowledge of how to do, sometimes counteracts that. Leaving out of consideration land costs, and taking into account piecemeal construction, I think,

in come cases, if we were able to analyze those things, we would find that the first cost of a railroad was higher than the cost now to reproduce; I think frequently, enough to take up the increase in value of right of way. Concrete and constructural steel are the only items which have gone down.

Rail 30 or 40 years ago cost $60 to $100 per ton. It would be difficult in the absence of records to ascertain original cost of South Shore.

Q. Assuming a development and growth of the road like the South Shore in that territory during a period of say 30 years, you would expect original cost of the parts of that road, leaving out the land now for the time, to be as high, would you not, as your estimate of reproduction new?

A. I don't like to go on the record, because I haven't had an opportunity to make that search, but I would be under the impression that I might expect to find that to be true.

Cost of reproduction of South Shore would be increased, I think, if there were no other railroads in the territory, in cost of sup-
768 plies, subsistence, materials, labor and boarding men.

Q. The problem of depreciation, I think we agreed during the cross-examination, was an important one, and quite elusive, like the definition of values?

A. Yes.

I did not intend to represent South Shore as in only 81% of operating efficiency, or that it is not in proper efficiency. The 81% is the first column depreciated into the second column; you could not get the second column without first spending the money in the first. I did not intend to indicate that the value of the use of the property in its existing condition was less than the value of its use new. Certain parts of it as an operating tool are more valuable than if brand new.

This is true of all parts of the road, so far as earnings and operation are concerned. My depreciation is based on inspection. The percentages of condition arrived at by application of straight line method of depreciation does not represent value any more than present value column or percentage column in my appraisal; they are often unjust. Railroads, generally, reasonably well located, with reasonable traffic and rates, properly operated and maintained, are always worth more than reproduction new cost; we pre-suppose a net revenue if they have reasonable traffic and reasonable rates. Assuming a reasonable volume of business and reasonable rates, the South Shore road as an instrument of commerce is worth more than
769 my estimate of its reproduction new cost at $15,500,000, leaving out the terminals. The commercial or sales value may be destroyed by reduction of rates.

If the road was earning a sum over and above its fixed charges, it would be worth more than it could be produced for, meaning the commercial value or the estimate of its value in the eyes of the public, as shown by the earnings. The par or market value of the stocks and bonds, or the sale value, has nothing to do with the value of the use of the property.

Including International bridge, Soo Union Depot and Mackinaw Transportation Co. property, my total reproduction new value is

$15,949,099, and present value $12,334,745. This is the face of our totals, not including corrections.

It is a principle of my valuation not to depreciate labor items; Mr. Riggs, and everybody I know of, carries track laying at 100% because it is a labor item. It is a question, very debatable. Track laying and surfacing includes the temporary surfacing before ballast is applied. On ballast I did not depreciate the labor of applying, but did depreciate the material and hauling.

The hauling is a labor item; everything can be reduced to labor. We allowed 2¢ for ballast material, leaving 53¢ labor and hauling, or 4% material to 96% labor. Everything comes down to labor.

Q. Isn't it as reasonable to decline to depreciate the 96% of labor in ballast as the 100% of labor in track laying and surfacing, or the 5% or 6% in rails, or whatever per cent it is in rails?

770 A. Well, it is true that the value of all material is practically dependent on the cost of the labor, and the assumption in this case was, as with all other material, that the price of the material alongside was 35 cents, the same as we would purchase steel at $28 a ton, if we attempted to keep the labor item up. Of course, in the rail we would have to go to the steel mill, and go everywhere where the item of labor appeared, and I presume that there is a criticism, and that perhaps the whole thing ought to be depreciated including the labor.

Q. Here is an item of track laying, which is labor, all labor, a hundred per cent; now right there, analogous kind of work is ballasting; that is most all labor?

A. Yes, everything is all labor.

Q. Well, the ballasting as you analyze it—take the item as it is built up, applying ballast, it is 96% we will say for the purposes of the point, labor; now track laying is all labor, you carry it at 100 per cent?

A. Yes.

Q. And the question has come to my mind: I cannot answer myself—why shouldn't ballasting be treated in the same way, at least insofar as the 96% of labor?

A. Well, I can't say; if we carried out that theory, of course, it would apply to every item in the railroad, that we ordinarily buy. Here is how this comes about: We ordinarily buy the ballast at so much a yard delivered alongside, and the railroad installs the

771 ballast with its own force, the same as it does the rail or any other thing they buy. Now, if we analyze everything down to its constituent parts, probably 95% of everything would be labor. I was saying how this comes about. I presume, strictly speaking, that we should depreciate all the labor, but I don't know, that is a point just between.

Q. Don't you see what led to this? It was the item of rails, where you did not depreciate the hauling item or freight item of rails?

A. No.

Q. But you do depreciate the haulage or freight item, so-called, of the ballast, and it struck me that there was a sort of contradiction or anomaly there?

A. I don't think there is, after all. We generally buy the rails delivered F. O. B. at the point of delivery; we generally buy ballast the same way, and all other materials that go into construction, and the habit has grown up, I presume, the habit of thought that because we do that and because there is no expenditure on the part of the railroad for the labor in the steel plant, or in the hauling of the steel or any of those items, we consider the cost of that to be 35 cents in the case of ballast, and that the labor is performed by the railroad, and that it is constant. I don't know that that can be defended or not. I am sure I don't know whether that could be defended. It perhaps ought to be depreciated, and that is how we have depreciated it, whether it is correct or not.

772 Q. You think that track laying ought not to be; the practice is settled on that, isn't it?

A. I have always kept it constant. At the time of my appraisal in New Jersey, we debated that for hours and hours, and we couldn't come to any conclusion that was entirely satisfactory.

Ballast needs renewal from time to time, due, in large measure, to its sinking into roadbed. Upon the ballast sinking into the roadbed, it makes it better and more solid; on soft ground, I would prefer earth, or even hay, as a mattress. In the bank that has been made, filled, it is improved as a usable thing by addition of ballast. Railroad men like plenty of clean ballast, they don't figure on any value. They may consider it of value to the roadbed, but not in the value of the ballast, as it has ceased to be ballast. As a rule, it makes the railroad better. The roadbed is better after the second application of ballast, to take the place of the first, which has sunk into the roadbed, than it was before.

My estimate does not take into account betterments to roadbed by gravel additions put on as ballast. The ballast, after it settles down and ceases to perform the function of ballast, may or may not strengthen and render more stable the roadbed. A hard or solid roadbed is not desirable, but a springy but solid roadbed is. I don't suppose experience justifies the inference that the adding of ballast upon soil on South Shore makes bed too solid. It is the solidification of the embankment which makes it worth more. Sand and

773 gravel ballast sinking into the soft and unpacked places in the soil on roadbed like South Shore makes the road worth more.

The common method of construction is to elevate the outer rail at curves according to speed desired for trains; a well recognized formula for this exists. They also increase the gu*a*ge owing to the degree of curve.

This is to avoid crowding the outer wheel over the rail, i. e. to help slew the trucks. The outer rail is longer than the inner; the wheels do not turn on the axles of the truck, and both wheels have to make the same number of revolutions, so the wheels traveling on the inner rail have to slip some on the rail.

If the elevation of outer rail is markedly excessive for the speed at which trains move, flange will not wear inner rail; it never does that. There would be greater stress and wear on top or ball of the

inner rail—not on inside. In direct testimony, I was only asked about inner side.

HANSEL.

Redirect examination.

By Mr. Wykes:

I have prepared a statement indicating corrections in Defts.' Ex. 15, Hansel. (The following indicates the corrections:)

774 *Memorandum of Additions to the Hansel Appraisal of the D., S. S. & A. Ry. Ex.* 15.

Schedule I—Real Estate.

	Value new.	Present value.
Sault Ste. Marie, Items 2 and 3, page 17:		
50 foot right of way to Kelley Mayer Co., American Brick Co., Bradley Watkins Co. 2.8 Acres at $1500 ..... $4200 ½ Interest 2100	$2,100	$2,100
Marquette, Item 49, page 20:		
Consolidated Fuel & Lumber Co. grounds, 2 Acres at $1500	7,500	7,500
Marquette, Item 54, page 20:		
1160 ft. of right of way 100 ft. wide 2.7 Acres at $250	675	675
Iron Mine Branches:		
Item 67, page 21, Winthrop Branch; trackage rights 1.94 miles, considered equivalent to 50 ft right of way. 11.8 acres at $2000..... $23,600 Previous total for item 67..... 6,900	16,700	16,700
Item 68, page 21, Mary Charlotte Branch 3 acres x ($2000—$100)	5,700	5,700
Item 69, page 21, Palmer branch 31.3 Acres x ($2000—$100)	59,470	59,470
	$92,145	$92,145
Overhead expenses, 15%	13,822	13,822
Total amount to be added to Hansel Valuation, Schedule I.....	$105,967	$105,967

775 Schedule V.

Bridges, Trestles and Culverts:	Value new.	Present value.
Add $8.00 per M F. B. M. to the unit prices of timber in Bridges, Trestles and Culverts, to cover cost of transportation by team, etc.		
This addition applies to a total of 3,850 M F. B. M. and amounts to	$30,800	$18,788
Overhead expenses, 15%	4,620	4,620
Total amount to be added to Hansel Valuation, Schedule V	$35,420	$23,408

The 15% added for overhead charges was not depreciated. It takes into account the contingencies, those are not depreciated. On a bridge, when 80% condition is reached, the time has come nearer when it must be replaced; when it is replaced, it involves an engineering charge, a new contingency with the overhead charges that apply to that kind of an item. In the railroad as a whole, as the structures are replaced, the overhead charges will again occur throughout the railroad somewhere. The points at which those will occur is measured by the percentage of condition; the same
776 applies in less degree to the renewal of parts; the percentage may be higher or lower, owing to the character of the repair, but those items come under the charge of upkeep.

As the time approaches when a structure must be renewed, the time also approaches when not only the material, but the labor as well, must be put back. In a bridge structure, that appears not only in the material, but in the labor.

Q. Tell me what distinction there is between that and the item of labor that occurs in track laying and surfacing?

A. Well, in track laying and surfacing, the item that is expended by the railroad is in the act of placing the materials on the roadbed and surfacing it, and that is constant, no matter what the cost of the material is, and it has been the practice, perhaps without any sound basis, of not depreciating the cost of the track laying and surfacing, the idea being that the ballast is delivered at the price. The majority of the cost of the ballast may be in labor, but it is generally furnished the same as bridge timber or steel, or cars or any other item to the railroad generally speaking, and therefore the habit has grown up—that is, I have done it, at least—of considering the labor of putting that in place as a constant element, because it is going on day by day, all the time, and it differs somewhat from any other expenditures of labor on the road, because of the fact that it is an item that can be constantly kept at a percentage of efficiency, and it is about the only item that can.

777 Q. Then the reason you do not depreciate labor in track laying and surfacing is, that it is kept at a hundred per cent of efficiency, not that it is kept at a hundred per cent of condition?

A. That is it exactly. I stated in my testimony that, in depreciat-

ing the condition of the roadbed, I did not intend to depreciate the efficiency of the roadbed. That is about the only factor in the physical elements of a railroad that can be kept constant; it is turning over every day, you might say, except in winter time, when they don't disturb the track, but even then some things are done to it to sustain it, whereas a bridge or any other structure, you cannot overcome the decrepitude, the invisible or intangible decrepitude, there comes a time when the whole structure has got to be changed.

Q. Suppose the condition were permitted to run down to 50 per cent on track laying and surfacing, would not then, to bring it back to a hundred per cent condition, it be necessary to add both material and labor on equally proportionate amounts, to bring it back to the hundred per cent ?

A. Yes, I should say that would be true.

With the material put in to renew the track laying and surfacing goes the cost of labor of putting it in. My theory of including the cost of labor constant is for the reason that it is being constantly operated upon; it is different from any other item of the road. It is
778 ope[illegible]o a variety of opinions, whether the cost of labor should be [illegible]stant. In my opinion it ought to be included as a constant factor. On ore dock at Marquette, I depreciated 40% covering entire structure, including labor, material, engineering, contingency and everything of that character. This was true also of buildings, I don't recall any exception to the rule, except in track laying and surfacing. Labor forms a large part of the cost of all materials; it would be large in rail. There is a very small percentage of the cost of labor expressed in the iron ore. There cannot be any betterment on account of the track laying and surfacing; it is a constant factor, which must be the same item over and over again, so I feel that it always exists there. There would be a betterment where you put in a heavier rail in the excess cost.

On the inspection of the South Shore made by myself and assistants, I spent sufficient time to do the matter justice to all concerned. In my judgment, taking into account the manner of preparation for my appraisal, the inspection and time spent on the work personally by me was sufficient to form the basis for the appraisal I made. My personal time on the work covered a period of three months—something every day. I feel satisfied that I gave the work all the time it required, and it was at all times under my personal direction and supervision. Have gone over the data at hand and comprised in the appraisal sufficiently to satisfy myself that it is correct.

779 For land value I included the excess cost to acquire for railroad purposes, and the values I have placed take into consideration elements which make my valuation higher than the normal or ordinary land values in the community. For rural right of way we added 100%, and in other cases considered the severance damage in addition to the increased cost of acquisition.

Generally, where I rejected parts of parcels from railroad use, I gave higher price to the area included on account of the severance. The value of the whole, including the excluded area, would average slightly below what we averaged for the whole.

I never attempted to value the land of South Shore for railroad purposes, meaning as an income producing utility; I made no investigation of, and I don't know anything about, the South Shore earnings or its traffic, except by general observation. I have no knowledge of the operations of the road. I have not sufficient knowledge to say whether it produced or does not produce sufficient earnings, or whether a particular classification of rates is too high or too low, or what it should expect to get out of a particular kind of traffic.

Q. And if you have answered any such question, is it with reservation that you had not made any detailed investigation of those things?

A. I certainly haven't made any detailed investigation, and I do not feel entitled to answer any question along that line. I
780 did answer some suppositious questions, hypothetical questions, suppositious cases; I gave my opinion, that is all.

Q. Leaving out of consideration entirely the Minnesota rate cases and the other rate cases that have been decided since you testified, and having in mind the criticisms of your valuation that have been presented to you, are you still satisfied with the appraisal which you have made with the exception of the places in which you have modified it?

A. Yes, sir.

Q. And those modifications appear in your testimony today?

A. Yes, sir. I have no corrections that I feel should be made. I have never made any investigation to determine rate of return expected on investments in Upper Peninsula of Michigan. I have knowledge of very many bond issues which bear less rates of return than 6%, very many below 5%, a considerable number below 4.5%, and some as low as 4%.

The general concensus of opinion is that the density of traffic decreases the unit of cost; this applies in both the passenger and freight traffic.

Q. To answer whether the South Shore is or could be profitably operated, would it be necessary for you to know the character and extent and rates and costs of the ore traffic?

A. Yes, sir, all the traffic and the operating conditions and contracts for interchange of business with all the lines that there
781 is interchange or possibility of interchange with.

Q. Did you know anything about the ore traffic except very generally when you gave your previous testimony?

A. No, sir.

Q. Would it also be necessary to know the contract and operating conditions as between this railroad and the Canadian Pacific, which is a parent company?

A. Yes, sir. I think, as I have stated, it is necessary to know the contracts with all companies, that would include a parent company, if any such existed.

Q. A community that afforded a heavy ore traffic might indicate greater returns from railroad operation than would be indicated by population, or other industries generally, might it not?

A. Yes, I think it would be entirely independent of any such

conditions. It might be, and probably would be, independent of population and dependent upon the volume of ore and the price per ton mile for carriage and the cost of the service to carry it.

Q. Before you could determine whether the money could be obtained to build the South Shore, or to rebuild it, if it were taken out of the territory in which it is located at present, you would be obliged to know, would you not, the earnings, the sources of the earnings, the possibility of connections with other companies, the question of whether it was making betterments out of operating ex-
782 penses, and a great many other considerations that have not been mentioned in this case in testimony at which you have been present?

A. I would say yes to all of that.

Q. Mr. Eldredge suggests this form of question: Do you think you have sufficient knowledge upon which to predicate an opinion as to whether the money could be obtained to rebuild the South Shore?

A. No, I have not

Expense of piecemeal construction due to widening shoulders, putting in of ditches, perfection of alignment, etc. is charged to operating expenses, as a rule, and is considered upkeep of the roadbed. In adaptation and solidification due to age and renewal of ballast due to operation, there is no charge to capital for any added value growing out of those things. There is no betterment account on ballast in I. C. C. classification.

I have made no investigation of the original cost of an existing railroad; I have not had any experience except where I constructed; I have never made any investigation of a railroad or part of a railroad 15 or more years old, with a view to getting at original cost, and have never made comparisons of costs dated back 15 years or more with present day values. There is nothing in this case which permits me to make an approximation of a comparison of the original cost of South Shore with my value or Riggs' value.

Item of injury to employes in contingencies; If I were a
783 contractor, I would include it in unit prices. Road would not be worth any more because accident occurred, though it would cost that much more.

There are many other elements of items of contingency that are a burden, instead of a value; that would apply to strikes, washouts, failure of material to arrive, and a variety of other things entering into contingencies.

All of these unfor-seen expenses are included and allowed in my unit prices, except where I have allowed extra.

784 HANSEL.

Recross-examination.

By Mr. Eldredge:

Item 68, Mary Charlotte Branch, originally valued at $100 per acre, now valued $2,000 per acre; that is entirely on account of the

minerals supposed to be in the land. I made no investigation to know whether it had any other or different value; there is not any other value apparent. Regardless of what Mr. Belden stated, there is not any evidence of any demand for building purposes on strip covered by this 3 acres. I did not pay any attention to Mr. Belden; the land was unoccupied and there was no evidence of activity.

Embankments increase in value by lapse of time. I allowed no such value on South Shore in reproduction cost, except to give 10% on account of the shrinkage to try and produce the same condition which it is impossible to produce actually, meaning 10% extra yardage allowance. It is the practice of many railroads to sod their embankments and frequently the slope of the cuts. Nature does the same on slopes and banks; they add value to the railroad, and could be appraised. I included no such elements in my valuation. In answer to Mr. Wykes' question, I mean that, as a general proposition under ordinary conditions, the land along the railroad increases in value after the construction.

Route of South Shore into Marquette and Houghton from east especially adapted for railroad use. I added no value on ac-
785 count of that. South Shore road as it comes into Marquette, after crossing Carp River, presents a cheap method of constructing a railroad almost the cheapest imaginable. Referring to construction, it is very economical and leads to a natural place for a yard. The cost of constructing that railroad and yard is less than it would be approaching Marquette from east over any other route.

Q. Would it not be a way to estimate the value of that land for railroad purposes, if you took the difference between the cost of the construction through it and the cheapest cost elsewhere?

A. Yes, that would be a minimum value for it; it might be worth a great deal more. I didn't undertake that problem, you understand.

Q. Estimated in that way, it would present a minimum value?

A. I think so.

Q. Estimated in that way, the valuation which you have put upon the company's property in Lake Street, aside from the water front in connection with the ore docks, speaking of it simply as railroad construction, is much less than its value for railroad purposes?

A. Speaking of it that way, yes sir.

Q. And that is true of the entrance into Houghton, all the way practically from Chassell, to Houghton, is it not?

A. Yes, not in such a degree, I should think, though; not to such a degree in dollars and cents, I should think In other words,
786 the difference per mile would be greater at Marquette. I should think; it would be higher cost at Marquette per mile.

Q. Can you bear the location in mind?

A. I think I do.

787 On July 23, 1913.

CRESCENT A. PARKER, a witness called by defendants.

Direct examination.

By Mr. Wykes:

I have been connected with the Michigan Tax Commission and State Board of Assessors since March 1, 1901, first in a clerical capacity, and later as accountant, performing work of accountant eight or ten years, and carrying the title since 1909. I have access to records and files of the Tax Commission and State Board of Assessors.

(It is agreed that the Cooley 1900 appraisal was a valuation of the physical property of Michigan railroads, with the intent to establish the cost of reproduction new and the present value as depreciated.) The summary of that valuation indicates the value of the separate items of physical property and the totals of physical property of plaintiff, which are: Cost of reproduction, $11,433,202; present value, $8,875.624.

(It is understood between counsel that the whole of such appraisal shall be considered in evidence; the record marked Defts.' Ex. 23, 1900 appraisal. Mr. Eldredge details objection to introduction of 1900 appraisal, and Mr. Wykes states the purpose for which it is introduced, being to establish value in 1900 bearing on value today.)

(Witness produces summary of 1902 State appraisal; same marked Defts.' Ex. 24, and offered in evidence.)

(Counsel agree, with reference to the valuation of 1902, that its general purpose was this: Plaintiff had filed a bill in the United States Court to restrain the collection of taxes upon its property, claiming that its property was assessed in the year 1902 at full cash value, while property throughout the state locally assessed was assessed at
788 less than its true cash value. The State defended, on the ground that if the property throughout the state were not assessed at true cash value, neither was the property of plaint- so assessed. The items of the inventory of the property of plaintiff valued on the part of the State in 1902 were in general the same as in the 1900 State appraisal.)

In the summary of 1902 appraisal of plaintiff's property, the several detailed items are given; the totals, excluding stores and supplies, are, cost of reproduction, $11,820,036, and present physical value, $9,087,095.

Substantially the same people made the 1902 appraisal as that of 1900, Professors Cooley, Adams and Riggs being employed. The State had passed an act assessing railroads on ad valorem basis, and the 1902 appraisal was done as a part of the Attorney General's work in defending litigation involving taxes of 1902. The railroads con-

tended that a general under-valuation of the general properties of the state existed, and that the general properties were assessed at a fraction over 81%, and the appraisal was made to show that the railroad property was not assessed at its cash value in 1902, but, rather, was undervalued.

PARKER.

Cross-examination.

By Mr. Eldredge:

The summaries of the 1902 appraisal are the only details of any kind connected with that appraisal which are in our office. These summaries were turned over — the Tax Commission after the litigation, for use in revising the 1900 figures. The railroads were first taxed ad valorem on property in 1902, and the South Shore final assessment was $12,500,000; the assessment of 1903 was $11,000,000.

789 PARKER.

Direct examination resumed:

In 1905, there was another valuation of railroads in which Professor Cooley participated, and of which he had charge. This was an attempt to cause the State Board of Assessors to increase the railroad valuation. The Attorney General claimed the assessment to be too low, and retained Professor Cooley and his associates. (Witness produced summary of the appraisal, which was marked Defts.' Ex. 25, and introduced in evidence.) The summary shows results for plaintiff for 1905 as follows: Cost of reproduction, $12,818,512; present value, $9,960,405. The appraisal of 1905 was completed Feb. 14, 1906.

PARKER.

Cross-examination resumed:

The detail of this summary of the 1905 appraisal is in the Attorney General's office.

PARKER.

Direct examination resumed:

(It is agreed between counsel that reports of plaintiff to the Michigan State Board of Assessors and the Michigan and Wisconsin Railroad Commissions, 1900 to 1912, and all reports filed with such board or commissions during the pendency of this litigation, are to be treated as in evidence and may be referred to and included in the record, and used by either party.)

The details of value and description of property of plaintiff, as claimed in its sworn reports to the State Board of Assessors from 1903 to 1912, are as follows:

790 Plaintiff's report to the State Board of Assessors for the year ending June 30, 1912, under the caption, "Real Estate Owned. Detailed statement of the real estate owned by the Company in Michigan on the 30th day of June, 1912, where situate and the value thereof. (Typewritten sheets may be attached if necessary.) Description and Location. * * * The value of the following items being taken together to make up the total value: Engineering, Right of Way & Station Grounds, Real Estate, Grading, Bridges, Trestles & Culverts, Ties, Rails, Track Fastenings, Frogs & Switches, Ballast, Track Laying & Surfacing, Fences, Crossings, Cattle Guards & Signs, Interlocking & Signal Apparatus, Telegraph, Station Buildings & Fixtures, Shops, Roundhouses & Turntables, Water and Fuel Stations, Warehouses, Docks & Wharves, and Miscellaneous Structures," reports the value as $9,117,946

The personal property, under the caption, "Personal Property. Detailed statement o fall Personal Property, including moneys and credits owned by the Company in Michigan, on the 30th day of June, 1912. (Typewritten sheets may be attached if necessary.) Description. Personal property of the Duluth, South Shore & Atlantic Railway Co. situated in the State of Michigan as follows: Cash, Stores & Supplies, Shop Machinery & Tools, Ferries, and a proportion of the total value of Locomotives, Passenger, Freight and Miscellaneous Equipment," is reported as 2,027,000

A total of $11,144,946

The oath in plaintiff's 1912 report to the State Board of Assessors was as follows:

"I, the undersigned, A. B. Eldredge, President of the Duluth, South Shore & Atlantic Railway Company, on oath do say
791 that the foregoing return has been prepared, under my direction, from the original books, papers, and records of said Company; that I have carefully examined the same, and declare the same to be a complete and correct statement of the business and affairs of said Company in respect to each and every matter and thing therein set forth, to the best of my knowledge, information and belief; and I further say that no deductions were made before stating the gross earnings or receipts herein set forth, except those shown in the foregoing accounts; and that the accounts and figures contained in the foregoing return embrace all of the financial operations of said Company during the period for which said return is made.

"I further state that the valuation of property, except as otherwise appearing, are my estimates of the value based upon earning capacity of the property & that I have no other means of personally making a valuation. I further state that I do not know the value of the lands listed as not used in operation and I believe that some of the lands so listed are in fact used for railway purposes, that this is a

matter not easy to determine and is now involved as a legal question in a suit between the Railway Co. & the State.

(Signed) A. B. ELDREDGE, *President.*

Subscribed and sworn to before me at Marquette, Mich., this 14th day of September, 1912.

(Signed) W. J. ELLISON,
Notary Public."

The records of the State Board of Assessors, 1902 to 1912, show the following details with regard to values reported and claimed by plaintiff, and assessments made of the property:

Year.	Total claimed in report.	Tentative assessment.	Final assessment.	Claimed on review by plaintiff's representative.
1902.....	$4,462,261	$11,250,000	$12,500,000	$7,698,850
1903.....	7,832,195	11,300,000	11,000,000	9,000,000
1904.....	7,777,224	10,000,000	9,500,000	7,950,000
1905.....	7,711,354	9,650,000	9,500,000	8,434,133
1906.....	7,884,151	9,650,000	9,625,000	9,000,000
1907.....	7,898,925	9,675,000	9,675,000	No Appearance
1908.....	7,655,582	9,675,000	9,675,000	" "
1909.....	7,426,535	9,600,000	9,600,000	" "
1910.....	7,768,605	9,600,000	9,600,000	" "
1911.....	11,131,000	9,600,000	9,600,000	" "
1912.....	11,144,946	9,600,000	9,600,000	" "

792 PARKER.

Cross-examination resumed:

Plaintiff was represented on review, 1902 to 1906 inclusive; its representative, on each appearance, claimed values higher than stated in the report; in no instance did the Board adopt as low a value as claimed by plaintiff's representative.

I have been present at a number of the sessions of the State Board of Assessors when they valued railroad property; they did not make a valuation of each separate item, except through following the State appraisals. There are no details kept of the railroad assessments. The Board comes to their judgment and sets down the gross figures; I don't think the valuation of any road was ever based on an inventory and valuation of the separate items. It is not the individual judgment of any one man.

The starting point was largely the Cooley appraisal, and they took into consideration earnings and prospective earnings. They started out with the Cooley appraisal, which has always been before them as a guide. If the earnings indicate a greater valuation, they use the earning value. I think there never was but one road assessed more than the Cooley and Adams appraisals.

PARKER.

Direct examination resumed:

The statute requires the State Board of Assessors to assess railroad property at its true cash value. The Board has before it the idea that the general property is under-assessed, and that probably affects its judgment, somewhat, in these matters, but I would not want to state.

793 The following is a part of the certificate attached to the assessment roll:

"I do further certify that we have set down in the above assessment roll, all the property of railroad companies, union station and depot companies, telegraph companies, telephone companies, sleeping car companies, express companies, car loaning companies, stock car companies, refrigerator car companies, fast freight companies, and all other companies, subject to taxation in this State by a State Board of Assessors, according to our best information, and that we have assessed the same at what we believe to be the true cash value thereof."

The Gailbraith bill was Act 282 of 1905; under that bill, the Board attempted to establish the average rate, by bringing the other property to its true cash value. After the passage of the Galbraith law, the Board attempted, following provisions of that law, to determine an average rate, by adding to the value of the state a certain amount which they conceived was the amount necessary to bring the assessed value of the state to 100%, using that as a divisor for the purpose of determining an equalized rate, dividing that into the amount of the tax of the state for that year. The rate applied to railroad properties is the average rate on general properties of the state assessed locally.

That average rate in 1905 was $17.40. The assessed value of the state for that year was $1,574,422,700, and the Board, in the attempt to equalize, brought that amount up to $1,875,000,000, on the assumption that the assessments of railroads were at cash value. Since 1905, the railroad assessments have not fallen off, but have increased seven or eight millions; a number of small properties have gone off the roll. The increase has been in the value of the same properties.

In the first year, the State Board attempted to make an equalization, and the equalized average rate then reached was $13.62; the actual average rate that year was $16.55, while the 1912 rate

794 was $20.80, per thousand dollars of valuation. The State Board of Assessors in 1902 found the percentage of undervaluation of the general property of the state to be at 82%, or substantially 18% less than cash value. That action proceeded upon the assumption that the railroad properties were assessed at cash value and the other property at 82% of value. In the attempted equalization of 1905, the percentage of assessment of the general properties was found to be 84%, and the railroad properties were assumed to be at cash value.

The aggregate assessments of the railroad properties were, in 1902,

$198,641,000, and in 1912, $210,884,500. From 1902, the assessments of the general properties of the state have steadily increased. The State Board of Assessors, in making its railroad assessments, always has before it the inventories and appraisals of 1900, 1902 and 1905; they compare back and forth, and take into consideration all the elements that they can consider in valuing property. They have before them an abstract of the reports containing, in condensed form, the mileage for ten years, the equipment, cost of the road, cost of equipment, earnings, expenses, income sheet, balance sheet, previous assessed valuation, Cooley and Adams appraisals—every item of information it can give them—and additions and betterments, shown in a separate item.

The Board does not place any separate value on the specific items, but their attempt is to reach a value for the property. The value is really the agreement of the members of the Board, and may be a little more than the Cooley appraisal with additions and betterments, and sometimes a little less. The Board, in making its assessments, has before it the figures reported by the company as the value of its property.

795 PARKER.

Cross-examination resumed:

I would not say the Cooley appraisal of 1900 was very good evidence of the value of a railroad in 1913, nor would the 1905 appraisal be, without additions and betterments. The value of all railroads is higher in 1912 than in the appraisal of 1900, and, in many instances, considerably.

PARKER.

Direct examination resumed:

The State Tax Commission has a large force of men at work in nine or ten counties endeavoring to bring them to cash value; they are now working in Marquette and Baraga counties, and last year worked in Gogebic, Iron and Dickinson counties.

The general instruction is that they are to value these properties as near as possible to cash value. They go out and make the examinations (they are equipped with the sales), to verify the sales in the first place, the first and second parties, and the consideration, the parties to the paper, and to value all the property, real and personal. And they are instructed to inspect every piece of property on the assessment roll, and to discover omitted properties. They are expected to examine, and pass their judgment on, every piece of property. The report is filed with the Board, and it calls a review, if necessary. Gogebic County was completed and reviewed last year, and the property placed on the roll.

(Mr. Eldredge makes detailed objection to the results, on the theory that the man investigating should be produced to prove the

values. Defendants' position is that values for assessment so fixed are evidence of the value of the adjacent railroad lands.)

796–7 I have tabulated the figures showing the values placed by the citizens' committee in Marquette on certain real estate there as an informal assessment, and also the assessments of 1911 and 1912. The tabulation shows a list of lands commencing at about the south city limits of Marquette and proceeding right through the city to the western limits, following the track as closely as possible; also the lands following the south track out of the city, and the lands following the Dead River branch, to the north. It shows the addition they are located in, the description as found on the assessment roll, the value placed on that same property by the informal committee, and the value at which said properties were assessed in 1911 and 1912.

The figures appearing in the last three columns are dollars. The descriptions are sufficient to identify the lands. I took the figures off the rolls, myself, and I intended they should be, and I believe they are, correct. I think the majority of the cases have buildings on, and they are included in the figures. The table is marked Exhibit 27*a*.

798 By informal valuation is meant that made by a committee with regard to which plaintiff's witnesses, Robertson and Asire, were cross examined. (Mr. Eldredge makes detailed objection, on the ground that the figures are not official and have no more weight than any other hearsay evidence.) I found this informal roll in the office of the City Comptroller, in Marquette, and other figures for 1911 and 1912 were taken from the original assessment rolls. The State Board of Tax Commissioners is now making a valuation and assessment in Marquette County, having completed Marquette City. The law requires Michigan assessments to be at cash value. These rolls contain the usual certificates which state these assessments to be at cash value.

PARKER.

Cross-examination resumed:

Notwithstanding the law makes this requirement, it has not always been complied with. Until the State Board of Tax Commissioners took the matter in hand, cash value assessing had not been done, I think, anywhere in the state. The Tax Commission took the matter in hand seriously a number of years ago, and then there were a few years they were rather quiet, hindered by the fact that their powers were curtailed; the law now gives them ample power.

I made up the Marquette list, myself, from the rolls. I think, in general, you could follow the descriptions of the outlying property along the line of South Shore, from the south, right through to the west. The property in Marquette is either adjacent to the railroad property or was so situated as to, in my judgment, throw some light on its value.

799 The Tax Commission was trying to get the property as close as possible to cash value. There is always a range of judgment, and somewhere between the ranges of judgment the truth lies. They don't want to get it over cash value, but endeavor to get cash value. I have not had an opportunity, personally, to know what they did to real estate values in Marquette; the records are not back here yet. The values now appear on the local assessment roll, and are accessible there.

PARKER.

Direct examination resumed:

The only case where real estate is omitted is where someone is exempted. The Tax Commission was very active from 1900 to 1905. During that time, many counties in Lower Peninsula—60% of them—were reviewed. One year, 20 counties were reviewed. Except on one or two special complaints, the general trend, where reviews have been held, has been upward. The assessments of the state from 1899 to 1905 were increased from $968,000,000 to $1,574,000,000, an increase of $606,000,000. From 1905 to 1912, the increase was to $2,078,694,409, or an increase of $504,000,000. From 1902 to 1912, the increase was $660,000,000.

I have attended reviews; the field men are present at them. In the last few years, there has been a placard at hearings, stating all property is to be assessed at cash value. I don't think there are any printed instructions to the men; frequently, we have taken them in for a school of instructions. I attended the last one, here, in December. At this meeting, the problems met in the work are talked over; the Commission gave its ideas regarding the work, and the general instructions were cash value.

800 PARKER.

Cross-examination resumed:

Relatively, the Tax Commission has not been reducing the valuation of property reported by tax payers under oath below the figures represented in many cases; I know of two instances. I know of no instance where they did in a whole town. In the year in which they valued 21 counties, the force of men employed was 50 or 60, and they were engaged largely in verifying sales, etc. They took from the County records all of the sales, and interviewed one or both of the parties, verifying the sales and finding out the actual considerations.

Mr. Wykes: Mr. Eldredge, in the litigation referred to, in 1902, in the course of which the valuation of 1902 was made, will you concede that this litigation was in the Circuit Court of the United States for the Western District of Michigan, and that it was appealed to the Supreme Court of the United States, and that one of the claims of error of the complainant was as follows? The claim of appeal is this:

"The assessment in question in this case was upon the property of the complainant at its true cash value. The rate imposed upon the property of the complainant by the proceedings in question in this case was the average rate paid upon property in the State other than that included in said Act upon which ad valorem taxes were assessed for State, County, Township, School and municipal purposes. The evidence shows that such other property was uniformly intentionally and generally assessed at the time in question at eighty-two per cent (82%) of its true cash value; 17 per cent of the tax in question, therefore, should be set aside."

Mr. Eldredge: Objecting to the proof as irrelevant and immaterial, I do concede it.

Mr. Wykes: I produce the record in the case of the Duluth, South Shore & Atlantic Railway Company against the Auditor
801 General, Perry F. Powers, being No. 477 of the October term of the Supreme Court of the United States of 1905, and ask to have it marked as Defts.' Ex. 26. That is the official printed transcript.

Mr. Eldredge: Objecting to it as irrelevant and immaterial, I will concede that in that litigation the complainant here offered in evidence a communication from the State Board of Tax Commissioners to the State Board of Equalization, in which they set forth that they had determined the percentage of true cash value as compared with the assessed valuation in certain townships, as follows:

Alger County:

Au Train	75.0%
Burt	80.0%
Limestone	75.0%
Mathias	70.0%
Munising	90.0%
Onota	90.0%
Rock River	75.0%

Baraga County:

Arvon	52.6%
Baraga	50.1%
Covington	57.2%
L'Anse	43.0%
Spur	48.2%

Chippewa County:

Sault Ste. Marie Township	65.0%
Dafter Township	65.0%
Superior Township	75.0%
Trout Lake Township	60.0%
Sault Ste. Marie City	100.0%

Gogebic County:

Bessemer City	66.8%
Ironwood Township	56.3%
Bessemer Township	50.0%
Wakefield Township	37.9%
Marinesco Township	87.5%

Houghton County:

Chassell Township	51.9%
Duncan	54.3%
Portage	48.7%

802

Luce County:

Columbus Township	65.0%
McMillan Township	75.0%
Pentland	60.0%

Mackinaw County:

Brevort Township	94.1%
Hendricks	30.0%
Moran	80.0%
St. Ignace	63.0%
St. Ignace City	101.1%

Ontonagon County:

Haight	41.5%
Interior	38.1%
Matchwood	44.4%
McMillan	34.2%
Rockland	56.2%

Schoolcraft County:

Manistique Township	48.8%
Germfask	22.8%
Seney	31.3%

It is stated that these percentages do not include the assessed valuation of several mines.

Mr. Wykes: Will you admit that at the time of the litigation Mr. Dust was a member of the State Boards of Tax Commissioners and Assessors and was called as a witness for the complainant?

Mr. Eldredge: Yes.

Mr. Wykes: Will you admit that he testified that the State was assessed at from 85% to 90% of its value?

Mr. Eldredge: I will admit that upon cross examination Mr. Dust testified that he had no knowledge of any county in the state which

was, in 1902, assessed as low as 30%, saying, "I don't think there was any assessment as low as 30% in 1902, giving your best estimate," and he said, "Well, I should think from 85% up, 85% up to 95% or 96%, or along in there."

Mr. Wykes: Will you admit that two of the other commissioners—Freeman and Sayre—made affidavits on behalf of the com-
803 plainant to the effect that the state was assessed at above 80% of its cash value in 1902?

Mr. Eldredge: It is understood, Mr. Wykes, that all of these admissions are subject to my objection that the testimony offered is irrelevant and immaterial.

Mr. Wykes: Yes.

Mr. Eldredge: I will admit that in that litigation Tax Commissioner, Freeman, said, in an affidavit made on behalf of all the different complainants in the litigation referred to, that the total true cash value of the property of the state of Michigan, other than that subject to assessment by the State Board of Assessors, *were,* according to the information and knowledge of said Freeman, assessed at 82.7% of the true cash value thereof, and that Commissioner Sayre, in a like affidavit, said exactly the same thing.

Mr. Wykes: Will you admit that that affidavit was prepared for these men by complainant's attorney?

Mr. Eldredge: If the record shows it, I will admit it.

PARKER, recalled.

Further direct examination.

By Mr. Wykes:

The State Board of Tax Commissioners has informed the State Board of Equalization every five years of the cash value of the state, as determined by them; to get the data on which to advise, a systematic investigation was carried on; the advice was submitted, generally, in the form of a report. The State Board of Equalization met in 1911, and the State Board of Tax Commissioners made a report to it that year. The getting together of the data upon which that report was based took most of 1910 and to the middle of August, 1911, with a force varying from 60 to 80 men, and, at times, 100.

804 Q. What was the method of their investigation?

A. The first step was to take from the County records, or the records in the office of the Register of Deeds, a transcript of the sales that had taken place in two or three years. Those sales were then classified; I mean, by that, they were taken and sorted over with a view of getting rid of all dollar considerations, with a view of eliminating, as far as possible, all transactions that appeared to be family transactions, between relatives and families, with an idea of getting only straight sales to use in its investigation. In a great many counties, they made personal investigation with their men, verifying these considerations stated in the papers, verifying from one party or the other, the party that sold or the party that purchased the property. In other counties, they confined their attention to simply an inves-

tigation of the sales or a computation based on the sales as compared with the assessed valuations. In all of the counties, they compared the sales with the assessed valuations of the same properties that were involved in the transactions.

The purpose of the recourse to sales was to establish the sale value of the property. (The witness produced a copy of the report of the State Board of Assessors, based upon the data thus gathered for 1911.) The percentages reported for the several counties traversed by the D. S. S. & A. were:

Alger	44.8%
Baraga	44.1%
Gogebic	22.7%
Houghton	76.4%
Marquette	37.0%
Ontonagon	37.5%
Chippewa	59.3%
Mackinaw	43.4%
Luce	56.5%
Schoolcraft	34.8%

805 The report states the method of collecting the data, and the number of sales examined.

Q. Read that part of the report, will you, please?

A. "General property. Transcripts of all real estate transfers evidenced by warranty deed, covering a period of 3 years, were taken from the records in the offices of the various registers of deeds throughout the State. The number of transfers so taken was over 200,000 and included all recorded within the period mentioned. The consideration named in each of these sales was then compared with the assessed valuation of the same property and these records were then taken to the office of the Board and the data properly assembled; only such transfers were used in making compilations as upon examination and investigation were found to be bona fide sales. The per cent of assessed to actual value for each county was then determined, based upon the considerations in the various deeds, and the assessed value of the same properties; this per cent was then applied to the total assessed valuation of both real estate and personal property in the county. The Board in so far as it has been able to do so with the force at its command, has examined and verified the transfers referred to."

The report is a printed public document. Personal property did not enter into the percentages; they were determined on real estate. The percentages arrived at and reported for the different townships through which the line of the South Shore runs were:

Alger County:

Au Train	32.4%
Munising Township	40.2%
Onota	55.5%
Rock River	46.7%

Baraga County:

Baraga Township	54.2%
Covington	34.5%
L'Anse	43.3%
Spur	49.3%

Chippewa County:

Bay Mills (No percentage arrived at)	
Superior Township	65.58%
Trout Lake	44.47%
Sault Ste. Marie City	74.43%
Sault Ste. Marie Township	59.7%

806

Gogebic County:

Bessemer Township	49.33%
Ironwood Township	34.24%
Wakefield Township	40.71%
Bessemer City	43.27%

Houghton County:

Chassell	28.03%
Duncan	33.92%
Portage	47.26%

Luce County:

Columbus Township	26.70%
McMillan	38.05%
Pentland	41.77%

Mackinaw County:

Brevort	35.48%
Hendricks	45.35%
Moran	36.17%
Portage	52.69%
St. Ignace Township	53.71%

Marquette County:

Chocolay	49.8%
Ely	14.1%
Humboldt	41.7%
Ishpeming Township	22.8%
Marquette Township	34.9%
Michigamme Township	31.5%
Negaunee Township	27.5%
Republic Township	45.3%
Sands Township	12.1%
Tilden	34.1%
Ishpeming City	55.7%
Negaunee City	40.5%
Marquette City	62.7%

The townships in Marquette County through which the road does not run shows percentages as follows:

Forsythe	32.1%
Powell	31.0%
Richmond	16.1%
Skandia	25.8%
Turin	37.6%
Wells	28.8%
West Branch	32.8%

The percentages for townships in Ontonagon and Schoolcraft counties through which the road does not run are as follows:

807 Ontonagan County:

Haight	30.19%
Interior	23.35%
McMillan	19.92%
Matchwood	23.63%
Stannard	22.20%

Schoolcraft County:

Germfask	26.91%
Cusino	22.06%
Seney	28.33%
Manistique	29.17%

Previous to the meeting of the State Board of Equalization, in 1906, information and data on sales were collected by the Tax Commission for the report to the State Board of Equalization. The data collected for the 1906 report did not enter into the 1911 report; we simply used sales in the three-year period preceding it. Report to the State Board of Equalization for 1911, being official report, produced and marked Defts.' Ex. 26.)

I have taken from the original assessment roll of the townships and municipalities traversed by the track, as near as I could ascertain them from the condensed profile, and entered upon an exhibit, the description, name of owner or occupant, acreage and assessed values; I took them all from the tax roll, using care to see that they were correctly taken off. The list begins at Sault Ste. Marie, mile post 2.80, and runs straight across the state, with the exception of a few cities and villages. (Tabulation marked Defts.' Ex. 27.) The list is so made that I can divide the different sections into the different municipalities.

Q. What have you done towards or in the way of affecting the assessed values with the percentages indicated by the Tax Commission's investigations for the different townships in which the descriptions lying along the right of way appear?

A. I simply totaled the assessed valuation for each municipality as shown here, grouped by mile posts, and applied the percent-

808 ages which I have just read into the record, or the per cents which I have read into the record, to such assessed valuation, and then, in that way, determined an actual value, and that actual value I have divided by the total acreage affected, and determined from that an acreage price for each municipality. I may have two divisions of acreage and acreage prices for one municipality, but it is assembled by mile posts. What I tried to do is to reduce the figures for a township to a total, embracing only the descriptions abutting on or lying adjacent to the railroad; if I didn't, it is in exceptional instances.

A summary of the assessments that appear later in Ex. 27 shows, by columns, county, civil division or municipality, South Shore mile posts, value per acre, based on Tax Commission's per cents, that column being subdivided to show acreage prices assessed, and actual prices based on percentages. Ex. 27 shows, for each township assessed, the value of the lands taken, and the actual value, found by applying the Tax Commission percentages, as reported to the State Board of Equalization, to the assessed value.

This summary comprises the first four sheets of Defts.' Ex. 27; the fifth and sixth sheets show the counties, percentages of assessment in townships, the acreage that enters into the computation, its assessed value, the average assessed value of the acreage, and the actual value as determined by the application of the percentages to the total assessed value; that is also indicated by mile posts, and the average actual value per acre for the county is shown. I find the actual value per acre by counties, produced in that way, to be:

Chippewa	$8.05
Luce	7.54
Schoolcraft	5.01
Alger	6.84
809 Marquette	9.18
Baraga	11.15
Houghton	15.12
Ontonagon	12.85
Gogebic	12.67
Mackinaw	7.07

The computations on pages 1 to 6 inclusive of Defts.' Ex. 27 are my own, and I believe they are correct. Page 7 is the actual detail from which is made the information shown on the summary, comprising the descriptions and values taken from the local rolls, from the exhibit; the amounts arrived at as the value of the lands along the South Shore, computed through the use of the percentages used, are:

812 I have made a compilation of sales of lands along South Shore right of way. These sales were taken from the offices of the Register of Deeds, and part of them by the men of the Tax Commission, and part of them were furnished me later by Registers in certain counties. The sales cover, in general, from 1907 to late in 1911. A part of the sales that were gathered by the Tax Commission men were gathered during their work in preparation for the State equalization in 1911, and, so far as I had opportunity, I got sales from other Registers to supplement those sales and bring them up to date.

Where sales indicated on their face that they were either family or dollar considerations, they were thrown out. The Tax Commission sales had been verified, investigated and examined. I have compiled the sales by townships and counties along the railroad, arranging them in two belts, the first five miles on each side of the track and the second one mile on each side of the track; the sales are all of rural property. (Compilation marked Defts.' Ex. 30.)

By Defts.' Ex. 30 I arrived at $30.97 per acre for lands in Sault Ste. Marie Township; the sales in that township were in 47-1, which is close to, and in part in, the city; the furthest distance from the city of those descriptions is two miles, and some of them are right up to the limits. In the results in Defts.' Ex. 30 no attempt was made to separate the transfer into buildings and lands; by taking one or two buildings, it will materially increase the average figure, depending on the number and size of the descriptions, price, cost of improvement, etc. There is nothing in the exhibit or transfers to show whether the land is improved.

(Proceedings of the State Board of Equalization, 1901 and 1906, contained in printed publications of the State, produced,
813 marked Defts.' Exhibits 31 and 32, and offered in evidence.)

Mr. Wykes: I produce copies of acceptance of land grants by the Bay de Noquet and Marquette Railroad Company, by the Marquette and Ontonagon Railway Company, and No. 3 is the Houghton and Ontonagon Railroad Company.

Mr. Eldredge: The plaintiff admits that they are correct copies of the documents which they purpose to represent, and objects to them on the ground of irrelevancy and immateriality.

(Papers referred to marked Defts.' Exhibits 33, 34 and 35.) Ex. 33 acceptance by Bay de Noquet and Marquette, contains the following clause:

"Resolved, That the Bay De Noquet and Marquette Railroad Company do hereby accept the lands, franchise of rights and powers and privileges, conferred upon said Company by an act of the Legislature of the State of Michigan Entitled, An Act disposing of certain grants of land made to the State of Michigan for Railroad purposes by act of Congress approved June 3, 1856, approved February 14, 1857, and the said Company do hereby agree and assent to the provisions and requirements of all the terms and conditions and provisions imposed by the same."

Defts.' Ex. 34, acceptance by Marquette and Ontonagon, contains the following paragraph:

"That the Marquette and Ontonagon Railway Company does hereby accept the lands, franchises, rights powers and privileges conferred by an act of the Legislature of the State of Michigan, entitled an act disposing of certain grants of land made to the State of Michigan for Rail Road purposes by act of Congress, approved June 3, 1856, approved February fourteenth A. D. 1857, and that said Company hereby agrees & assents to the provisions and requirements of said act."

(Defts.' Ex. 35, acceptance of Houghton and Ontonagon Railroad Company.)

I have made an abstract of the reports of the South Shore Land Co. in the office of the Secretary of State for the years 1904
814 to 1913 inclusive. That abstract takes all the figures reported, and is correct. (Paper marked Defts.' Ex. 61—three sheets.)

On April 25, 1914.

PARKER recalled.

Further direct examination.

By Mr. Wykes:

The Iroquois Hotel site at the Soo was about one-eighth of a mile east of the South Shore station, on Portage Ave., and towards the business part of town—nearer the business part of town than the station.

(Mr. Wykes produced a copy of a printed report of the State Boards of Tax Commissioners and Assessors for the years 1911-1912, which was marked Defts.' Ex. 62.)

(The printed copy of the report of the Mackinac and Marquette R. R., found on page 77 to 88 of the printed report of the Commissioner of Railroads for 1887, and covering the period from Oct. 20 to Dec. 31, 1886, is marked Defts.' Ex. 63.)

(Defts.' Exhibits 53 to 63 inclusive offered in evidence, subject to the previous objections of Mr. Eldredge, who further objects to Defts.' Ex. 63 as irrelevant and immaterial, and also that the paragraph headed "remarks," on page 78, is not a part of the railroad company's report at all, and that, therefore, the language has no tendency to prove the facts therein stated.)

(Mr. Wykes produced the printed annual report of the Commissioner of Railroads for 1889, covering the year ending Dec. 31, 1888, and, subject to Mr. Eldredge's objection to it as irrelevant and immaterial, read from page xlvi thereof, as follows:)

815 "Duluth, South Shore & Atlantic was not inspected until October. The Mackinaw and Marquette division of this line has never been remunerative, and the long stretches of swamp through which it runs, where there is no ballast, has made it difficult and expensive to keep up. It has been built long enough so that bridges, culverts, and ties need renewing, and all need it now.

Many repairs had been made, and were still being made, so that the track is now safe. With the present energetic management it is believed that a more favorable report will be due next year.

"The M. H. & O. division and the Marquette & Western portions of this line are in much better condition and the public have little cause for complaint.

"The new line from Nestoria to the State line was built by contract, and was not constructed as well as railroads usually are by parties who expect to operate them. Under the present efficient management, however, the road has been improved to a large extent, and has been done in a very substantial manner. The road is now safe and the track is in excellent shape for a new line through what was a little more than two years ago an unbroken forest. The road forms a part of a through route from Duluth to the seaboard, and will be an important factor in the question of transportation from the northwest to Atlantic ports."

(Mr. Wykes produced a certified copy of the stenographic reports of the several hearings in review of the property of plaintiff before the State Board of Assessors, for the years 1903, 1904, 1905 and 1907, which was marked Defts.' Ex. 64. Mr. Eldredge objects, on the grounds that they are arguments made by an attorney in the course of his emploment, that they are not proved, and that they have no evidential force, since they could only be proved by the man who took the notes being produced and an opportunity given for cross examination.)

Mr. Wykes: From Defts.' Ex. 26, pages 129 to 131, I wish to read into the record the statement of Mr. F. H. Vandenboom before the State Board of Equalization, representing Marquette County.

Mr. Eldredge: I object to that, for the reason that the statement is obviously self-serving, that it is pure hearsay, and that it has no tendency to prove values, and that it deprives us of the power of cross examination.

816 The Master: Do you claim that this is competent evidence to prove the value of these lands in connection with this case?

Mr. Wykes: I do claim, your Honor please, where a railroad company puts in value for its property by paid experts, and on the behalf of the State other values are shown, and where they widely differ, you can take the statements of officials made in official capacity for the purpose of confirming one or the other, where it is a general proposition, as this is.

Mr. Eldredge: Who do you refer to when you talk about "paid experts?"

Mr. Wykes: I refer to any expert who is paid—Mr. Riggs, for example, or whoever else was called.

Mr. Eldredge: I will put on record that we will not claim anything for the value of land on account of Mr. Riggs' statements.

Mr. Wykes: At least, they will be admissions against you, and I intend to use them as such. Mr. Riggs' statements on certain of this land I intend to use as admissions by the railroad company.

(Mr. Wykes reads into the record the statement of F. H. Vanden-

boom before the State Board of Equalization. The statement is found on pages 129 to 131 of Defts.' Ex. 26. The following is an excerpt therefrom:)

I represent Marquette—at least, the eastern portion of it—and am not here to plead poverty nor to appeal for mercy. We come before this Board simply to show something of our actual values in at least the eastern end of Marquette County. I have no idea how the State Tax Commission arrived at the large values that they have put on the agricultural land, the cities, and the timber part of our county.

I have lived in Marquette County for 39 years, and know something of it, except the mines. About 25% of our land still contains standing timber, about 40% is cut-over, about 30% is rock and sand plains, and about 5% is agricultural land. I have made a careful estimate of the agricultural land, and only one-fifth of it is under cultivation. We have chopped-over land there for settlers,
817 and we hope to get them in, but will not be able to do so by doubling or tripling the valuation.

In getting at values, I have figured the farm land roughly at $10 an acre, because you can buy farm lands anywhere in the near vicinity of the larger towns or cities at that price, and the lands farther back that are tillable are held at only half that price. I have tried to bring this value up, to see if I could get it anywhere near the Tax Commission, but I have utterly failed.

On our rock and sand plains, I have figured those lands at $3.33 an acre, which would give us a value on those lands of $1,000,000. I daresay any man with half a million can take them. They are not valuable for any purpose, so far as I know, except to build a road across, to haul the products to somewhere else. The 40% of cut-over lands we have put at $5 an acre, or $2,000,000, as their actual value. Now, I think we have figured thoroughly high when we placed those cut-over lands at $5 an acre, and lots of it has been bought at $5 an acre and sold over again for the same money, and, in lots of cases, less. The 25% of timber land I have figured at $10 an acre, or $2,500,000, taking them together, whether near to or far from the railroad. This is fairly high, as the timber on it is mixed.

The city of Marquette is assessed at $6,700,000, and I daresay, if you took from it the city hall, the court house, and its churches, that the whole city could be bought for that money, for I know of several instances where property has been sold for exactly what it was assessed for, and in some cases less. I sold a small piece of property for $1,000 which was assessed at $1,000. Another good location sold last year for $750, while it was assessed at $800. Lots within a fourth of a mile of the post office, which were held a few years ago at $800, can now be had for $500.

The Tax Commission figures may be based on sales made for speculative purposes. For instance, I bought property at about $7.50 an acre and sold it for $30 to $50, to the Longyear and Ayers estate. They had to have it, but their scheme has now fallen through, and I bought property adjoining it for $10 an acre. I

bought 80 acres of land—40 of which had timber, and 40 of which cost the owner $2,500 to clear—for $500 for the 80 acres.

I will say to this Board that all we want is to be justly equalized and fairly treated; but, in regard to values, I will say that the Tax Commission has put our values entirely too high, because the value is not there. Now, some people have come in since I have been there and said that it was the Supervisor's business to keep his tax roll down as low as possible. This is not true of the Upper Peninsula.

The Supervisor has made an effort to keep his tax roll sufficiently high so one-half of 1% which he could raise for highway purposes would give him sufficient money for highway work, and the farmers are particularly anxious that they should raise a reasonable
818 sum for highway purposes, because nearly all the work, until the county road system came in, has been done by the farmers; so the farmer is perfectly willing to pay his share of an increased valuation, in order to make the land companies that own the bulk of the land pay their share, and he gets the entire amount of highway taxes back in his own hands by doing the labor when he has tome to do it. It is just like having it handed over, and so the Supervisor in the Upper Peninsula makes an effort to have his tax roll as high as possible. In fact, the tax roll of my own township has stood for years at approximately $200,000. Only a few years ago, there were several thousand acres taken off from our township to form what is known as Buell Township. Not one cent went off from our roll. We immediately raised the timber lands and farming lands sufficiently to still leave our roll at approximately $200,000.

I counted $500,000 for the farming land, which I think is ample. I think that the Tax Commission's estimate on our county is 100% more than the property is worth.

On May 5, 1914.

PARKER recalled.

Further direct examination.

By Mr. Wykes:

I asked Mr. McCormick to prepare the figures which he gave in his testimony, showing the operating ratios and the expenses under the different general classifications for the different railroad systems that he enumerated. I directed him to take system figures for other roads or systems than the South Shore, because we don't place any dependence on the division of operating expenses and earnings. They are not in a uniform manner, and there was one figure that we could depend on, and that was the system figure. The divisions to states are not made uniformly or on the same basis in the different reports.

I have never had all the data necessary to ascertain what the real expenses in Michigan were where the road was in different states. Here, in our work, the law requires that we are guided by track mileage in Michigan, and we use that as a rather rough and ready method

of dividing the earnings and expenses to Michigan for our
819 purposes, here. Occasionally, the different reports state the basis of the division of these operating expenses between Michigan and other states. Some of them have been done on a track mileage basis, and others on a revenue train mileage basis; others are stated merely as proportional, without stating what the proportion is; then, again, others do not say what the method is.

At your request, I have prepared a table of figures, from the South Shore reports for various years, showing the amounts expended for labor, and the averages paid employees. The data was taken from the reports to the railroad commission for the years 1908 to 1913 inclusive. The compilation shows the number of men employed, and the days worked, the compensation paid, and the average per day, for each of the years mentioned, subdivided further as to the classification of operating accounts to which these men were supposedly charged—really, into five grand divisions of the operating expense account, although they have included one other in some of the years, being outside operations. The figures which I have compiled are as follows:

Account.	Number of men.	Days worked.	Compensation.	Average per day.
1908:				
Maintenance of Way & Structures	433	158,730	$281,837.51	$1.78
Maintenance of Equipment	317	116,885	235,578.45	2.02
Traffic Expenses	3	962	3,840.00	3.99
Transportation Expenses	741	265,994	675,786.30	2.54
General Expenses	67	23,624	79,264.21	3.36
Outside Operations	...	.....	.....	....
	1,561	566,195	$1,276,306.47	$2.25
1909:				
Maintenance of Way & Structures	359	131,240	$213,513.60	$1.63
Maintenance of Equipment	293	107,129	218,693.59	2.04
Traffic Expenses	3	1,022	4,020.00	3.93
Transportation Expenses	641	229,297	578,557.22	2.52
General Expenses	65	23,213	79,131.63	3.41
Outside Operations	28	9,900	17,081.05	1.73
	1,389	501,801	$1,110,997:09	$2.21
1910:				
Maintenance of Way & Structures	527	160,913	$269,052.46	$1.67
Maintenance of Equipment	339	120,875	251,039.19	2.08
Traffic Expenses	3	1,021	3,933.47	3.85
Transportation Expenses	839	273,775	707,230.97	2.58
General Expenses	67	23,447	77,075.87	3.29
Outside Operations	27	7,793	12,636.88	1.62
	1,802	587,824	$1,320,968.84	$2.25

Account.	Number of men.	Days worked.	Compensation.	Average per day.
1911:				
Maintenance of Way & Structures	495	153,237	$262,643.05	$1.71
Maintenance of Equipment	383	111,199	233,320.38	2.10
Traffic Expenses	4	1,264	5,060.00	4.00
Transportation Expenses	889	262,654	700,738.55	2.67
General Expenses	70	25,484	48,578.45	3.32
Outside Operations	27	7,778	12,444.94	1.60
	1,868	561,616	$1,298,785.37	$2.31
1912:				
Maintenance of Way & Structures	673	166,418	$285,450.85	$1.72
Maintenance of Equipment	402	114,320	240,379.24	2.10
Traffic Expenses	5	1,573	6,110.00	3.88
Transportation Expenses	914	263,400	717,430.53	2.72
General Expenses	72	27,240	80,433.44	2.95
Outside Operations	31	7,720	12,624.89	1.64
	2,097	580,671	$1,342,428.95	$2.31
1913:				
Maintenance of Way & Structures	571	177,407	$327,694.59	$1.85
Maintenance of Equipment	440	126,147	272,390.21	2.16
Traffic Expenses	5	1,703	6,659.04	3.91
Transportation Expenses	1,079	294,382	815,460.73	2.77
General Expenses	61	23,061	61,168.84	2.65
Outside Operations	33	9,555	15,135.71	1.58
	2,189	632,255	$1,498,509.12	$2.37

821 I average the figures for the three years, 1908 to 1910; that was a simple average of the aggregate of the number of days of work of the men in any one of these departments—for instance, say, maintenance of way and structures, by dividing the aggregate compensation by the number of days' work we have the average per day. It is a simple arithmetical average. Then I got an average per day for the whole amount of labor. It is the actual average compensation paid. For 1908, 1909 and 1910, it is the average of 551,940 days for total compensation of $1,236,090; that is really a weighted average. I have prepared the same kind of an average for the three years, 1911, 1912 and 1913. (The witness read compilations into the record, as follows:)

Account.	Number of men.	Days worked.	Compensation.	Average per day.
Average for years 1908, 1909, and 1910:				
Maintenance of Way & Structures	440	150,294	$254,801.19	$1.70
Maintenance of Equipment	316	114,963	235,103.75	2.05
Traffic Expenses	3	1,002	3,931.16	3.92
Transportation Expenses	740	256,355	653,858.16	2.55
General Expenses	67	23,428	78,490.57	3.35
Outside Operations	18	5,898	9,905.97	1.68
	1,584	551,940	$1,236,090.80	$2.24
Average for years 1911, 1912, and 1913:				
Maintenance of Way & Structures	580	165,687	$291,929.50	$1.76
Maintenance of Equipment	408	117,222	248,696.61	2.12
Traffic Expenses	5	1,513	5,943.01	3.93
Transportation Expenses	960	273,479	744,543.27	2.72
General Expenses	68	25,262	75,393.58	2.98
Outside Operations	30	8,351	13,401.84	1.60
	2,051	591,514	$1,379,907.81	$2.33

822 PARKER.

Cross-examination.

By Mr. Eldredge:

My directions to Mr. McCormick were simply to get representative railroads of Michigan, and to take the system figures only, with the exception of South Shore. The D. C. & W. has only been operating about two years, and transportation expense would be about the only normal expenses which it had. The D. T. & S. L. runs from Detroit to Toledo. Its traffic is entirely freight, and it has a good tonnage. It is not a road that ought to be compared with normal roads, unless you were using all of them together, possibly, to get a representative system out of them.

I averaged the expenses of employees by taking the three years and aggregating the days' work and the compensation, and then divided those aggregates, which gave me the average per day. That average is a weighted average, because it isn't applicable so much to the one group of laborers, but is the actual true average of the wages paid to all of the men.

On June 4, 1914.

PARKER recalled.

Further direct examination.

By Mr. Wykes:

I assisted in the preparation of Defts.' Ex. 72, Thompson, from inception to conclusion. I assisted in procuring the data, working the ratios and applying the method of Mr. Thompson, having a hand in and knowledge of every step. Ex. 72 correctly carries out the Thompson plan or method for the division of expenses as applied to plaintiff's accounts.

I have just (June, 1914) completed an investigation of plaintiff's books, to procure data to apply the same plan to the accounts of plaintiff for the year ending June 30, 1913. I have worked
823 out the ratios necessary in the application of that plan to the accounts of 1913, giving the same numbers to the same ratios as in 1912. I followed, throughout, substantially the same method as was applied in 1912, and, where I deviated from that method, I will mention it; otherwise, it will be the same as in 1912.

The gross ton miles were obtained as in 1912, except that in 1913 we had access to the individual locomotive mileage in Michigan, and used the individual mileage against the locomotives making it, whereas, in 1912, by reason of having the system mileage of locomotives, the locomotive ton miles was determined by average weights. In other respects, the computation of the gross ton mile ratio was the same in 1913 as in 1912, with the exception that in 1913 there was no computation for mileage on the Mineral Range.

The reason for making the computation for mileage on the Mineral Range in 1912 was that there was three months' operation of those tracks, the mileage of which was included in the mileage of South Shore trains. The contract changed about Oct. 1, 1912, and no mileage has been computed for the Mineral Range since. During the three months of 1912, plaintiff paid for the operations of those trains and received the revenue; subsequently, it paid for the operation of the trains, but did not receive the revenue.

Plaintiff does receive what you might call wheelage, or track rental; that is received from the C. & N. W. and C. M. & St. P. for mileage on its tracks and the Mineral Range. Plaintiff now absorbs any other revenue from those sources. During the three months of 1912, and before, plaintiff paid the Mineral Range 40¢ a train mile.

For Ratio 2, where in 1912 we made allocations and assignments of the track, in 1913 we took Complt.'s Ex. 1*a*, Riggs, and used the Riggs allocations bodily. In 1913, we accepted Riggs' allo-
824 cations of exclusive ore track; in 1912, it rested on my judgment, which was arrived at by inquiry of operating officials regarding the character of traffic on the various branches and the fact that I had known a good deal of the character of the traffic on these branches from being in this case. I considered as ore mileage in 1912 the mileage from Eagle Mills to Winthrop Jct., on the south track, traffic spurs of 15.55 miles which I cannot now definitely locate (which compares with 16.05 of Riggs for 1913 in Complt.'s Ex. 1*a*, Riggs), and joint spurs of 1.59 miles, as compared with Riggs' 1.37 miles—a total mileage, in 1912, of 25.47, while Riggs' total is 26.25. This is main line, branches and traffic spurs. Of the sidings, I included 21.72 miles in 1912, while Complt.'s Ex. 1*a* shows 31.84.

In arriving at Ratio 4 for 1913, we applied the same percentage for delay by passenger trains to freight trains as was computed by Mr. Thompson for 1912, namely, 2.75%. We deducted the 2.75% from the time of the freight trains.

Ratio 8. Plaintiff's records in 1913 show the actual interstate and intrastate revenues for Wisconsin, and I availed myself of those figures, which produced the ratio I have for 1913. The 1912 explanation on Ex. 72 shows how it was arrived at for that year.

Ratio 11 is different in 1912 from 1913, in that in 1913 there was no deduction in passenger train mileage made on Mineral Range.

Ratio 13 was determined in the same manner in both 1912 and 1913. On the basis of the total yard and road switching in Michigan being 100%, it subdivides to passenger 3.41% and to freight 96.59%. This was obtained on the basis of time as related to the activities of the various yards in which switching was done.
825 We observed St. Ignace, Marquette and Houghton yards, took notice of the number of passenger trains for which any switching was done at these points, took observation of what would be a liberal amount of time devoted to that work, aggregated the time, converted it into miles upon the factor of six miles per hour, and determined therefrom the total number of miles which would be made in such operations at each yard.

In arriving at the passenger percentage, we observed the movements of the passenger trains requiring or receiving switching in the various yards, applied to each of those movements an amount of time in our judgment more than proper, reduced the same to miles on the basis of six miles per hour, and then deducted from the total yard switching.

The 1913 percentages for Ratio 13 were based upon the 1912 and 1913 observations, being applied to the train movement of 1913. The percentages for passenger switching, as given by me for 1912 and 1913, of 3.40% and 3.90%, represent, in my judgment, a sufficient amount for passenger service. If there is any error, it is against us,—against the passenger side of the case,—by reason of drawing a greater percentage into passenger switching than actually exists. The freight switching entering into this ratio includes no road switching before one full hour is reached at any single point of switching.

Ratio 13*b* depends upon actual observations at individual yards.

The several ratios, 1 to 17, in Defts.' Exhibits 72, Thompson, and 77, Parker, are, as described therein, true ratios of the things they purport to be.

826 PARKER recalled.

Further direct examination.

By Mr. Wykes:

Q. Will you produce, Mr. Parker, the annual reports of the Association of Railroad Commissioners for the years 1891, 1892 and 1893?

A. I have these reports, 1891, 1892 and 1893.

Q. Taking the report for 1891, will you read the action and discussions of the Association of Railroad Commissioners with reference to the revenue train mileage basis for the apportionment of common expenses between passenger and freight?

Mr. Eldredge: I object to it as irrelevant and immaterial, and also that it pretends to be nothing more than a report of the proceedings of certain railroad commissioners, and that any statement that they might have made is not admissable in evidence and can only be proved by them and an opportunity given for cross-examination.

Mr. Wykes: The theory of using this, your Honor, is that in plaintiff's proof it appeared that the I. C. C. had in force for a long time the method of division of operating expenses on the revenue train mileage basis, but afterwards they abandoned it. Now, the abandonment was brought about through this action of the Association of Railway Commissioners, and I think under the entire proof it is a necessary part of that history, and I assume the Master will let this go in subject to Mr. Eldredge's objection, so you may read, Mr. Parker.

Mr. Eldredge: I wish to make this further objection, having

listened to Mr. Wykes' statement, that, even if it be true, the statements of a commissioner, or the proceedings of the Association, are not admissable in evidence, upon any theory, for the reason that the views and statements should be proved by the parties, and
827 they should be subject to cross-examination.

The Master: Do you propose to connect this discussion of the Railroad Commissioners with the action of the I. C. C. in abandoning the basis that you speak of?

Mr. Wykes: It has been connected by Prof. Adams and, I think, by Mr. Delf. But these documents have not gone in, and, you remember, Prof. Adams tried to give extracts, and Mr. Butler objected, on the ground that the books themselves were not produced and that Mr. Adams was giving extracts, and I am now producing the whole of the documents, in answer to Mr. Butler's objection, so as to furnish the whole thing. First, Mr. Luther, mark those three books defendants' exhibits; 1891 will be 94 (should be 66). I make the whole report as exhibit, and then, if Mr. Eldredge wants to refer to anything that I don't use, it is in the record, where he can do it. 1892 marked Defts.' Ex. 95 (should be 67), Parker, June 2, 1914; 1893 marked Defts.' Ex. 96 (should be 68), Parker, June 2, 1914.

Q. Now, Mr. Parker, you may proceed to read in evidence the extracts pertaining to the revenue train mileage basis which you find in each of the reports marked exhibits 94 to 96 inclusive, but which should be Defts.' Exhibits 66, 67 and 68.

From the report of the Committee on Uniformity of Railway Accounts, page 96 of the Proceedings of the Third Annual Convention of Railroad Commissioners, 1891:

"* * * The second proposition of the executive committee is to discontinue the division of expenses between passenger and freight and to abandon all efforts to ascertain the cost per passenger
828 per mile of the passenger traffic and the cost per ton per mile of the freight traffic, because the results obtained are only approximate, unreliable, and misleading. It is admitted and distinctly stated in the instructions accompanying the form of returns that the results obtained by the present method of apportionment are, and in the nature of the case must be, only approximate. It is difficult and perhaps impossible to determine just what proportion of the cost of maintenance of way and structures, which constitutes about twenty per cent of the total operating expenses, is properly chargeable to passenger and freight traffic respectively, and the same is equally true of many of the items under each of the different heads of operating expenses. A very considerable per cent of the total operating expenses can probably be definitely determined as properly chargeable either to passenger or freight traffic.

We think, however, that the present apportionment, on a basis of train mileage, of those expenses which cannot thus be definitely determined, generally gives a close approximation to the actual cost; and, while we would cheerfully recommend the adoption of any method which would give a more accurate result, we are reluctant

to advise the abandonment of all attempts to obtain the best information possible upon the subject. Furthermore, we believe that withholding from the public all information upon this subject is more likely to result in adverse and unjust legislation than to publish the best results obtainable, as is now done. In other words, legislation founded upon the best approximation to the truth which can be devised is less likely to be harmful to the railroads than that which is founded upon entire ignorance of the subject. Inasmuch, however, as the committee which had in charge the arrangement of the program for this Convention has assigned as a topic for special discussion the 'Apportionment of Expenses to Freight and Pas-
829 senger Traffic,' your committee does not feel like making final recommendation on this subject. This question, therefore, may properly be regarded as in the hands of the Convention itself. * * *.

WM. O. SEYMOUR.
ISAAC N. PHILLIPS.
ISAAC B. BROWN.

The Chairman: The report will be considered as adopted, if there is no objection. It is now before the Convention. I would inquire if representatives of the American Association of Railway Accounting Officers are present, and whether they would like to be heard at this time.

Mr. Riebenack: If it is in order I would like to make a few remarks with regard to that feature of the report which relates to the attempted division of expenses between freight and passenger business of railroads. I have given the subject considerable attention, and will only detain you a few moments to present what I think is the experience of all accounting officers.

I do not believe that anything now can be said in regard to the impracticability of arriving at reliable data for determining accurately the division of expenses between passenger and freight business in operating a railroad.

It has been a favorite idea with all the prominent lines in existence to arrive at some basis for so dividing their expenses, and the endeavor to accomplish this result has fully taxed the ingenuity and abilities of managers. The field has been well plowed and much seed sown, but the harvest has been barren, so far as any generally satisfactory conclusions are concerned.

830 In giving you some reasons for the cause of the failures, and in demonstrating the impracticability of attempting it in any manner so as to produce a basis universally applicable, I do not pretend to give any new thoughts, but merely to bring to your attention, in as plain a manner as possible, what has been attempted and what is being done, and to prove that the results reached are purely of local utility.

It is a recognized fact that only about 40 per cent of the expenses of a railroad divide themselves naturally as between the two great sources of revenue—freight and passenger—leaving about 60 per cent to be disposed of arbitrarily.

Five methods for accomplishing this have come to my knowledge, as follows:

First. Miles run by freight and passenger locomotives respectively.

Second. Miles run by freight and passenger trains respectively.

Third. Gross freight and passenger earnings respectively.

Fourth. Mileage of freight and passenger cars respectively.

Fifth. Freight tonnage mileage and passengers moved one mile.

With the first two of these I am most familiar, as it has been the basis for the past twenty-five years on which the company with which I am connected has allotted its expenses common to both passenger and freight business and not wholly chargeable to either.

The respective mileage is taken of the freight and passenger locomotives hauling the trains, regardless of whether the cars are few or many, loaded or empty.

831 Mileage of locomotives running mixed trains is allotted between freight and passenger mileage on the basis of the mileage made by exclusively freight and passenger locomotives.

The road is divided into three grand divisions, and a separate record of freight and passenger locomotive mileage is kept for each grand division. Separate records are also kept for the various subdivisions and branches under each grand division.

The percentages vary each year, and instructions are issued annually of the percentages on which the expenses common to both freight and passenger traffic are to be divided, based upon the previous year's mileage. To show you how they vary on the different divisions, take the line from New York to Pittsburgh, which is divided into four divisions, the first division from New York to Philadelphia; such expenses in 1890 were divided ½ and ½ each; from Philadelphia to Harrisburg, 7/10 freight and 3/10 passenger; Harrisburg to Altoona, 8/10 freight and 2/10 passenger, and Altoona to Pittsburgh, 7/10 freight and 3/10 passenger.

On the Philadelphia and Erie railroad the expenses of the entire three divisions are divided 8/10 freight and 2/10 passenger, it being principally a freight road.

On our Philadelphia, Wilmington and Baltimore railroad from Philadelphia to Baltimore the expenses are divided 4/10 freight and 6/10 passenger.

On the Camden and Atlantic railroad the passenger traffic largely predominates, the expenses being divided 2/10 freight and 8/10 passenger.

On the West Jersey railroad the expenses are divided 3/10 freight and 7/10 passenger.

832 This method is perfectly satisfactory to the officers of my company, and having been kept for so long a period it has added importance yearly as comparative information, measuring the efficiency of officers in operating, and producing economical administration; but it is clearly understood that it is not available in determining any policy affecting the making of rates, for the reason that the basis is abitrary, without solid principles as a foundation, and serves our purposes only as a gauge to keep expenditures within established bounds.

The second basis, miles run by freight and passenger trains respectively, is the one laid down by the Interstate Commerce Commission, with the proviso that for mixed trains the assumed ratio be ¾ freight and ¼ passenger.

This basis is arrived at by the assumption that the heavier weight of the freight train is offset by the higher speed of the lighter passenger train. While such a rule might apply to a few roads it cannot be made applicable to all railroads, as there is a wide difference between the relative weight of the freight and passenger trains to each other in different parts of the country.

All attempts made by railroad scientists in endeavoring to establish relative wear and tear of track and roadbed, as between the speed of fast express trains and the heavy weight of freight trains, have been clouded with doubts, and the various conditions of grade and location made any conclusions on one line of no value with another.

The third plan, dividing expenses in proportion to the gross freight and passenger earnings respectively, is no guide whatever, for the reason that in the same year either one of the classes of traffic may be affected by a reduction in rates that would lead to false conclusions, and be no guide for other years.

833 The fourth plan, division on the basis of mileage of freight and passenger cars respectively, has inequalities, as it assumes that the weight of freight and passenger cars is the same, while the fact is a passenger car weighs twice as much as a freight car.

The fifth theory, that carrying a passenger one mile is the same as carrying a ton of freight one mile, is merely an assumption, and it is not warranted by anything approaching an equitable demonstration.

The cost per ton per mile as now reported is the general average for all classes of freight, obtained by dividing the tons one mile into what has been assumed to be the cost for its movement, while a moment's reflection will convince any one that the expense of handling the various classes must differ as widely as the rates charged. For instance, shipments from New York to Chicago in the six established classes vary from $15.00 per ton to $5.00. One line may carry principally high-grade freight, dry goods, boots and shoes, etc., and another lowgrade freight, like lumber and ore. A general average of cost would therefore have no significance in deducting any conclusions—in fact, could only be misleading in most cases.

The cost per passenger per mile is still further from a fair basis. The passengers one mile are divided into the assumed passenger expenses, without any reference to the fact that the expenses for moving express, mails, and miscellaneous shipments, such as milk, marketing, etc., by passenger trains are included therein.

A low estimate places the cost of movement of mails and express business at about 70 per cent of the receipts, to which should be added all incidental expenses connected with conducting the business of these two important sources of revenue.

834 Another disturbing element which would seriously affect results of cost of movement is the financial condition of a railroad. A prosperous company may decide to charge to its operat-

ing expenses work done on account of betterments, such as substituting stone bridges for iron or wooden ones, rebuilding equipment of engines and cars on more costly plans, replacing old stations with more expensive structures, which would greatly increase the cost of moving a ton of freight or a passenger per mile. Another company of equal financial strength may not include such items in operating expenses, but carry such expenditures direct to 'income account' as 'extraordinary expenses,' while a third, whose reserve finances are not strong enough, would charge them to capital account.

It will be seen, therefore, that the attempts to show the average cost per mile of carrying a ton of freight or a passenger per mile leads us so deep into the field of conjecture as to make the thoughtful pause. When you consider that 60 per cent of the expenses of railroads cannot be divided at all, as between freight and passenger, the results obtained by the following of any arbitrary rule for making such division of expenses cannot be sufficiently definite for practical purposes, and if used as facts for basing legislative action upon them must be unjust and injurious both to the public at large and investors in railroad property. The object of all statistics is to obtain useful information as a guide to beneficial results, and no plan adopted should have any organic faults which may lead to misinformation and erroneous deductions.

Finally, is it so very desirable to have this information for arriving at general conclusions on which to base legal action? Is not the general result of the percentage of operation safer and a more reliable standard, for practical purposes, to judge by?

835 The statistics produced by the Interstate Commerce Commission from the reports of railroads are in most cases so thorough and complete, and their arrangement exhibits such great ability and a broad comprehension of what is desirable to be arrived at, that they may well serve as a model for the states to follow, but it is respectfully and impressively suggested that its valuable results should not be marred by any information that is based on assumption or theory and not demonstrable by clear and indisputable facts.

(Page 112:)

The Chairman: * * * The motion is that this whole subject is left in the hands of the committee that has it in charge, with instructions to report to the next Convention, and that in the meantime the members confer with the Association of Railway Accounting Officers.

Mr. Riebenack: That carries with it a postponement?

The Chairman: Yes sir.

The motion was agreed to."

From the Report of the Committee of Uniformity of Railway Accounts, Proceedings of the Fourth Annual Convention of Railroad Commissioners, 1892:

(Page 17:)

"* * * The two questions which most vitally affect the present form are:

1st. Shall taxes be considered as a fixed charge or as an operating expense? and

2nd. Shall the assignment of expenses to freight and passenger traffic be continued?

(Page 21:)

* * * We are now prepared to consider the second proposition, viz., whether the assignment to freight and passenger traffic should be continued. It is well known that a large proportion of expenses of operation is common to both the passenger and the freight service, but not wholly chargeable to either. Salaries of general officers, station agents, and telegraph operators, expenses of the maintenance of way and structures, and other like expenses, will serve as examples of those outlays which do not naturally divide between the passenger and the freight service. Other expenses there are that classify themselves. What per cent of the entire expense of operation is incapable of being accurately classified is variously stated, the lowest estimate being forty per cent, while some allege the amount to be as high as sixty per cent of the entire expense. This large proportion, expended for the common benefit of both branches of the service must, therefore, if apportioned at all, be divided in accordance with some arbitrary general rule. The rule now used is stated upon page 42, of the Form of Annual Report in these words:

836

'All expenses which are naturally chargeable to either passenger or freight traffic should be entered in their respective columns. Expenses which are not naturally chargeable to either traffic should be apportioned on a mileage, making the division as between passenger and freight traffic in the proportion which the passenger and freight train mileage bears to the total mileage of trains earning revenue.'

'Mixed trains will continue to be treated for the present as one-fourth passenger and three-fourths freight.'

We may observe, first, that the rule referring to mixed trains appears, so far as we can learn, to rest upon nothing more definite or valuable than someone's conjecture, and the identity of the conjecturer seems to be unknown. That it is based upon any experience or upon any theory that finds a basis in the facts of the railway business of the country has never been made apparent. This arbitrary rule, that one-fourth of the expenses of all mixed trains must be charged to passenger service and three-fourths to the freight service, is applied alike to those roads which do a larger passenger traffic and upon which mixed trains are the rare exception, and likewise upon frontier roads where both passenger and passenger traffic is conducted exclusively by mixed trains. There are several roads of the latter class in the State of Illinois, and

837

in the West it may be said generally that freight trains carry a few passengers in the 'caboose.' Whether every train which carries passengers at all would be classed as 'mixed' we do not know, but, certainly, if such trains are so classed, egregiously wrong results would be obtained under this rule, for on the roads of the West many trains carrying a heavy tonnage of freight frequently carry only a very few passengers, whose transportation forms but a mere incident of the entire service of the train.

Without going into a detailed argument, it will appear that the basis so furnished for the division of expenses of mixed trains must be of little value, and, while the volume of 'mixed' service is, perhaps, on the whole not large, it seems to us that either a rule which will produce results substantially correct and true should be found or else the effort to classify the common expenses of mixed trains should not be attempted.

The most obvious test of the rules given for both mixed and distinct trains would be the results of experience in using them. The test of actual practice fails to satisfy us that these rules are of any utility either to the companies, the States, or the nation. Indeed, if not substantially correct, they could not be expected to be useful and may prove positively vicious. We know that results have been reached by the application of these rules for division which are grossly erroneous, not to say preposterous. To illustrate, we
838 quote from certain letters of Stuyvesant Fish, president of the Illinois Central Railroad Company. The first concerns the report of that company for the year 1890. Mr. Fish, writing to Chairman Cooley, said:

'The arbitrary rule laid down by the Commission for the distribution of expenses between the passenger and freight service make it to appear that the Illinois Central earned 372/1000 of a cent per ton of freight per mile and only 34/1000 of a cent per passenger per mile. The case of the Dubuque & Sioux City railroad is even worse, it being made to appear to earn 338/1000 of a cent per ton of freight per mile, while its average receipts per passenger per mile are made to appear to be 273/1000 of a cent less than the estimated cost of carrying each passenger one mile. Obviously, the rule of the Commission charges too much of the expenses to the passenger and too little to the freight service.

* * * * * * *

'Being unable to suggest a safe rule for dividing the expenses, we do not presume to criticise the one adopted by the Commission further than to point out wherein it fails of application to the business of the Illinois Central Railroad Company, and to submit that it is not right to draw conclusions from, or wise to predicate action upon, figures so obviously erroneous.'

And, again commenting upon the Report for 1891, Mr. Fish says:

'The arbitrary rule laid down by the Commission for the distribution of expenses between the passenger and freight service make it appear that the Illinois Central earned during the past year

332/1000 of a cent per ton of freight per mile, and that it lost 77/1000 of a cent per passenger per mile, and that its entire passenger business was done at a loss of $141,715.37.'

Roads could perhaps be found, reporting to the Interstate Commission, whose business is so divided between the passenger and freight service and is performed under such conditions as to render the rule now in use as near right as any general rule that could be devised. Evidently, that rule, as Mr. Fish says, fails of proper application to the business of the Illinois Central Railroad Company; and probably other roads may be found from whose reports,
839 following this rule, it would appear that instead of too much expense being charged to passenger service and too little to freight, as in the case of the Illinois Central Company, it would be found that too much is charged to freight and to little to passenger. We have no such case at present in mind; but the varying conditions under which the railroads of the country do business, and the wide difference in the character of their respective traffics, renders it highly probable that such cases exist and might be found if searched for.

In answer to one of the above letters of Mr. Fish, judge Cooley, among other things, wrote:

'I understand very well that it is absolutely impossible to so apportion the cost of freight and passenger service as to reach accurate results. Nevertheless, if it is desirable to obtain the statistics of the roads at all, they ought to be obtained on the same basis. They would not otherwise be of much value. Our blank reports, therefore, are the same for all the roads.

* * * * * * *

'I may perhaps with propriety add that I can very well see that the application of the rule does not lead to correct information regarding the cost of passenger traffic considered by itself, and if the matter were exclusively in my hands I should probably make considerable change. It is too important a matter, however, to act hastily upon, and I think any action should be taken with the full accord of the Association of Railway Accounting Officers.'

Referring to the statement quoted above from Judge Cooley that 'any action should be taken with the full accord of the Association of Railway Accounting Officers,' it may be noted that the opinions of the railway accounting officers, in the association and out, which have, through the kindness of the statistician, been collected for the use of our committee, are practically unanimous in favor of discontinuing the attempt to apportion expenses between passenger and freight traffics. Thus we have the 'full accord of the associ-
840 ation' which his honor Judge Cooley thought desirable; and while we are aware that railway officials do not always view questions of this kind from the standpoint of the public interests, as it is the duty of railway commissioners to view them, still as regards this matter we are convinced, after full reflection, that the public interest is not antagonistic to that of the companies themselves, and that all the recommendations are made in the utmost good faith.

And this brings us to a consideration of the purpose of requiring this division, which it is admitted must be made, if at all, upon an arbitrary basis. It has been said (and we will meet the case squarely) that the fixing of tariff rates for the transportation of passengers and freights, under governmental authority, is likely to become one of the leading functions of the railway commissions of the country, and that it is therefore desirable that statistics be collected from which can be derived the information called for on page 61 of the commissioner's form to be used as a basis for the fixing of maximum freight and passenger rates. It is said such items as 'estimated cost of carrying each passenger one mile,' 'passenger earnings per mile of road,' 'passenger earnings per train-mile,' 'estimated cost of carrying one ton one mile,' 'freight earnings per mile of road,' and 'freight earnings per train-mile,' are necessary as a basis for the fixing of rates, and should be preserved even though perfectly correct results are not obtained.

Every one will admit that if the items of cost of freight and passenger service above quoted from the form on page 61 could be obtained with substantial correctness the information would be valuable, and it would certainly be quite as valuable for the roads as it would be for the railway commissions or other governmental agencies.

841 But we have not yet arrived at the point of being able to see how a body of inaccurate statistics, which are supposed to support another body of erroneous deductions, can be of practical value to any legislative or executive branch of government, any more than they would be valuable to the companies themselves. It is said a uniform basis must be adopted and maintained to secure the benefit of comparisons; but it is difficult to understand how, if one error is vicious and harmful, an accumulation of errors may become salutary; and it is quite as difficult to see how true statistical instruction may be derived by comparing a large number of errors more or less gross with each other.

We have little share, anyway, in the expectation that just railway rates will ever be established through statistical tables showing 'per mile,' 'per ton,' or 'per passenger' costs. We do not believe that information of this kind ever did furnish the basis for actually fixing tariff rates, or that it ever will, because we believe that, even where railway commissions are clothed with power to fix rates, such rates will be made up upon a different basis and depend upon different conditions from any disclosed by such statistics. Particularly must this be true so long as the cost items per unit of traffic are confessedly erroneous and do not represent the true facts of the case.

So far, therefore, from the statistics obtained from this division being valuable as affording a criterion for railway rates, we believe that the very fact that this false information is liable to be so used is the more cogent reason which could be given for ceasing to furnish a basis confessedly erroneous. A man who travels in the wrong direction is certainly as likely never to arrive at his destination as one who travels not at all.

842 By all this we do not mean to be understood as saying that unless absolutely correct and accurate information is obtained the attempt to classify expenses should be abandoned. We do, how-

ever, mean to say that unless a result which is substantially and approximately correct can be had, it is better to leave the subject untouched, and to permit (if a cost criterion must be had) the statistics of each road to be estimated separately and in the light of its own conditions of traffic, and to be so estimated by those who may have the rate-making power.

In the somewhat lengthy investigation we have made in this matter one fact has arisen to a position of absolute clearness in our mind, which is that no universal or uniform basis of such division of expenses will ever yield statistical results near enough correct to be of practical use, or, indeed, not to be positively harmful.

When we consider that the proposed division of expenses must be made on, say, some coal road of Southern Illinois which hauls an occasional passenger, by the same rule and upon the same basis which is applied to a passenger road connecting New York and Philadelphia or Philadelphia and Washington, what possible value can be expected in results so obtained?

If it were possible in the case of any single road to arrive at a correct rule for apportionment of operating expenses, it would remain doubtful whether the rule thus found would be applicable to any other road doing business in the country, and certainly it could never be applied to any considerable number of other roads.

Your committee also approve and would recommend the transfer of the items mentioned in the 'Suggestions' from 'General Expenses' to definite accounts, under the head of 'Conducting Transportation,' thus necessitating the introduction of some new accounts
843 under that heading, such as 'Superintendence,' 'Hire of Equipment,' 'Clearing Wrecks,' 'Oil, Tallow and Waste,' 'Outside Agencies and Advertising,' 'Commissions,' 'Stationery and Printing,' etc.

It is impossible to enumerate in detail all the minute changes suggested and to give the reasons therefor in this report without extending it beyond reasonable limits, but your committee recommend the adoption of the changes in the 'Classification of Operating Expenses' suggested by the executive committee of the Association of American Railway Accounting Officers, as shown in a copy of said suggestions filed with this report. If this Convention should see fit to adopt, in whole or in part, the recommendations of the committee, it is suggested that the changes shall not take effect until for the year ending June 30, 1893.

We desire to express our gratitude to the executive committee of the American Railway Accounting Association and to the statistician of the Interstate Commerce Commission for their valuable assistance in the discharge of our duties.

With the submission of this report your committee respectfully ask to be discharged.

WM. O. SEYMOUR.
ISAAC N. PHILLIPS.
ISAAC B. BROWN.

The Chairman: The Convention has heard the report of the Committee on Uniformity of Railway Accounts. What disposition is the pleasure of the Convention?

Mr. Becker: I move that the report be accepted and the committee discharged, and also that the report be laid on the table for
844 future consideration.

The motion was agreed to.

(Page 70:)

The Chairman: * * * The regular order for half past three is the report of the Committee on Uniformity of Railway Accounts, and its consideration is now in order.

The report seems to be in two parts—one in regard to taxation, and the other relates to distribution of accounts. They may be considered as a whole or separately, as the Convention may order."

From the Report of the Committee on Uniformity of Railway Accounts:

Mr. Hill of Virginia: "I desire to ask Mr. Seymour a question. I listened as carefully as I could to the reading of the report, but do I understand that the Committee reports in favor of abandoning the division of expenses as between freight and passenger traffic, and of hereafter including both under the head of operating expenses.

Mr. Seymour: The committee reported in favor of abandoning the apportionment of expenses between freight and passenger traffic.

Mr. Fleming: Mr. Chairman, if I may be permitted, I would like to make a suggestion. It is almost impossible for us to pass upon all these reports without some definite proposition be laid before the Convention. I don't remember that the committee proposed any special resolution summing up the practical points, and therefore I suggest that it would facilitate business if they would put in short form just what practical points they desire to have acted upon.
845 The Chairman: If the Chair may be permitted to suggest, it seems to me that the question should be, first, on the adoption of the report in regard to taxation, and then on the other part, so that action may be taken separately. * * *.

(Page 97:)

The Chairman: * * * The next recommendation of the committee is, as I understand it, one upon which the committee and the account-officers are unanimous.

Mr. Seymour: The question is upon the recommendation to discontinue apportioning the expenses between freight and passenger earnings. Upon that question the accounting officers and the committee are unanimous.

Mr. Adams, the Statistician: This proposal of the committee seems to me to be by far the most important one that comes up in this report, and I rise simply to suggest that, as it involves a very important question, I doubt whether it ought to be forced through. Before the

vote is taken I would like to be allowed about two minutes. All that I wish to say is this: It is doubtless true that the opinion of the railway accounting officers throughout the country supports the proposal of the committee. It is also true that the rule of apportionment of expenses as between passenger and freight earnings as laid down at the present time does not reach the best results.

My thought is, that inasmuch as the proposal of the committee involves the abandonment of all attempt to arrive at the cost per ton per mile and the cost per passenger per mile, the vote upon that proposal ought not to be taken without discussion. The aim of
846 statistics is to assist commissioners in the performance of their duties. If the statistician knows what the theory of rates is which the commissions to whom is entrusted the question of determining just and reasonable rates have accepted, he can adjust his work to that rule. There is at present no clearcut and universally accepted theory for determining what is a fair and reasonable rate, but if there be any shadow of such a theory, it is that rates are in some way attached to cost. This being true, I would ask if it is wise to abandon without discussion all attempt to get at the cost per ton per mile. I admit that the present rule for arriving at this result is an imperfect one, but it is possible that better rules may be formulated. It seems to me that in this matter the Convention should defer to the wishes of the commissioners, to whom is assigned the duty of determining what is a just and a reasonable rate. If the commissioners of such States say that the assignment of expenses to passenger and to freight is of no importance, I should heartily favor the recommendation of the Committee. It is because I feared that this most important question, so far as accounting is concerned, was to pass without discussion that I ventured to make these remarks.

Mr. Dey: I belong to a commission whose duty it has been to fix rates for the transportation of freight. It has been a very serious and difficult matter, and it seems to be the aim and wish of these corporations to give us just as little light as possible on the means by which we may arrive at a solution of questions presented. It strikes me that this matter should not be disposed of without a little more thought and a little discussion than it has had.

847 Mr. Wilson: This is a very important matter and I move that we adjourn until tomorrow at ten o'clock.

The motion was agreed to, and the Convention at 5:25 p. m. adjourned accordingly.

The Chairman: The Convention will come to order. Yesterday afternoon the Convention adjourned pending the discussion as to the division of expenses between passenger and freight traffic. Is it the pleasure of the Convention to proceed with that discussion, or to take up the report of the Committee next in order of business?

* * * * * * *

Mr. Adams: I am responsible I believe for having this question postponed until this morning.

The matter is one of very great importance, and I think that

of all the questions which are presented this session to the Convention, upon which a definite vote is expected, this is probably the most important. It would not be wise to enter into any extended discussion with regard to the ability of railway accountants to separate the expenses between passenger and freight, for I think it is conceded by all who have looked into this matter with care that that division cannot be made with absolute accuracy.

Looking at the matter, then from the point of view of an accountant or statistician, I will frankly say that if the matter is to come to a vote at the present time, I prefer that the recommendaion of the committee should be accepted, and that the assignment now
848 attempted between passenger and freight expenses should be abandoned. But, as I remarked last evening, the question is not entirely a question of accounts. The purpose for which this assignment between passenger and freight expenses has been maintained is to arrive at the average cost of moving a ton of average freight, and it is generally believed that this information is of assistance in determining what are fair and reasonable rates. The question, so far from being a question of accounts, is one which should be determined by those who are imposed by law with the duty of making rates.

The question presented to this Convention, therefore, reduces itself to this: Do the commissioners upon whom is imposed the duty of determining in particular cases whether a schedule of rates is just or unjust, of the estimated cost of moving a ton of freight one mile? This assignment of expenses to passenger and to freight traffic is something that has been going on for over thirty years, and I do not think its abandonment ought to be effected unless the matter is clearly understood. If it is abandoned it should be only after the most careful consideration. We have now before us the facts in the case so far as the representatives of the railways are able to present them. We have their side of the question clearly presented, and in the investigation undertaken by the statistical department of the Interstate Commerce Commission the opinions of the prominent railway auditors in this country have been gathered together. We have not, however, the views of the State railway commissioners, who are most interested in the question.

It occurred to me, therefore, Mr. Chairman, that possibly before a final vote came upon this very important question we should ask the commissioners of those States upon whom is imposed the duty of determining what is a reasonable and a just rate whether they
849 actually make use of this average; whether they regard this approximate information as useful? And if I were a member of this Body I should make a motion to the effect that this second recommendation of the committee be laid upon the table for a year—that is, until our next convention. In the meantime that there be appointed another committee, who shall correspond with the commissioners of the States referred to, and gather facts pertaining to the use that has been made in the past of this average cost per ton per mile and the opinions of these commissioners with regard to the desirability of continuing the apportionments.

Mr. Fort: I have listened with much interest to the remarks of the gentleman who has just taken his seat, and I hope this convention will not adopt the second recommendation of the committee. Representing a commission that is required to make rates, I beg leave to state that use is made by that commission of the items now sought to be combined. They are not regarded as strictly accurate, but as approximately so. They are considered as a circumstance in rate-making, and a very important one, and if we are to abandon that system because we cannot get mathematically correct information we will be absolutely in the dark on this subject. It seems to me it would be much better to have some information that is approximately correct than to have no information at all. The question of fixing just and reasonable rates covers a wide field, and a great many elements, of course, enter into the question for its proper determination. This is one circumstance which always, by the Georgia commission at least, is considered important. It frequently arises upon the questions of change of rates, on the question of fixing a standard or schedule, and it seems to me, as Judge Cooley says, the
850 railroad problem is the rate question. While only seventeen State commissions have authority to make rates the others, I dare say, will finally be given that power.

So I trust this Convention will not adopt the suggestions of the committee. While they have been very strongly presented, the substance of the argument, as I have gathered from the able report, is because we cannot get mathematically accurate information, we had better have no information. I do not think that is good reasoning, and, speaking for one of the commissions that has the rate-making power, I beg to enter my protest against the abandonment of this source of information that is much used and of much importance.

Mr. Wheeler: I in part represent a State whose commission has the rate-making power, and we disregard in making our rates the approximate passenger and freight expenses. We pay no attention to them, but we classify our roads according to the net earnings per mile. That includes both passenger and freight, and we base the rates upon those net earnings.

And I will say further that I do not believe there is a State in the Union where there is less friction between the people and the railroads than in the State of Illinois. They are satisfied on both sides. The people seem to be satisfied with the rates, the roads seem to be satisfied with the rates; at least they accept the rates—the maximum rates—as published by the commission, and in many instances make rates lower than those authorized by the commission. We do not prescribe minimum rates. We simply fix maximum rates, and the people are satisfied with the actions of the various roads in following the rates as established by the commission or in making lower rates than the commission authorizes. I repeat that I do not be-
851 lieve there is a State in the Union where there is less friction between the people and the railroads than in the State of Illinois.

Mr. Putney: Mr. Chairman, I am somewhat out of the pale of this discussion for the reason that in preparing a form for our railroads

to make their returns upon, and trying to conform as far as practicable to that of the Interstate Commerce Commission, we have cut out the apportionment of expenses entirely, and I cannot conceive of any circumstance that would induce us to put it back. But perhaps I may say a word about the reason. In the first place, I believe this division is largely arbitrary and therefore incorrect and misleading; it is of no use unless it is accurate, and that cannot be, in the nature of things. But it is suggested that if we cannot get just what we want, let us approximate to it. Now, we have the duty of regulating rates in our State—fixing the maximum charges and regulating them generally upon complaint. I have never been able to see how this division of expenses in the freight and passenger business helped us in the least; how it could help us if it was perfectly exact. It don't amount to anything to us when trying to fix a fair coal rate from the seaboard to our interior towns to know that the average cost for hauling all freight, including coal, baby carriages, benzine, silk, and everything else, is a cent per ton per mile. It won't help us, to give the people a fair rate through the gorges and over the heavy grades in the White mountains or to give it down in the suburbs, to know that the average rate and cost of hauling passengers is so much when we include the suburban passengers, where passenger trains are heavily loaded and the roads are easily and cheaply constructed, and also the mountain business, where passengers are few and the
852 cost of construction very great. And so I cannot see how it could help us in Georgia or New Hampshire, to fix a rate on a specific article for a specific distance, to know what, if we could know, the average expense of doing all of the business of the roads is. I think the items entirely misleading. They are made up necessarily by railroad accountants in an arbitrary guess-work manner. I never was able to see any earthly use for it, and it seems to me that that is one thing to avoid in these returns; it is calling for the impossible, or the absurd, or the useless.

They used to talk down in our country about a very eminent and radical Prohibitionist, of whom they said he would be a very useful citizen if he could let rum alone under every circumstance. There are lots of that kind of men; they cannot avoid doing too much; but it is what we ought to avoid when we call upon a railroad to furnish information which cannot be given, which is of no use if it could be given; it simply cheapens the whole system of railroad reports, it seems to me.

Mr. Fort (of Georgia): Would you say that a maximum rate fixed below the cost of service, economically performed, would be a just and reasonable rate?

Mr. Putney: I don't see that it affects it in the least. We are called upon to fix a rate on coal from the seaboard to a place forty miles in the interior. Now, if somebody will explain to me how the reports, as they have been called for heretofore, aid us in the least, I would like to know, if we could know, what it costs to haul that ton of coal. But you lump everything in a grand mess, and it has no relation to anything you want to know.

853 Mr. Beckman: Mr. Chairman, I would state that we are a good deal in the same fix in our State. We have some thirty roads. For some of the roads we establish a rate for passengers of 2½ cents per mile, and for others a rate of 10 cents per mile. If we did not allow 10 cents per mile the claim would be made that the passenger business was too light for a lower rating. We make a rate for almost every road. Where there is a great deal of travel we make a less rate; but where the travel is light and amounts to only a trifle we make a high rate. On one road they keep up forty miles of snow-shed, and we have to take all such things into consideration; therefore the statistics would be of very little use to us:

* * * * * * *

Mr. Fort: I move that it lay, this portion of the report, on the table, to be taken up at our next annual meeting. Perhaps we can arrive at that time ar some more accurate form than the one now adopted for ascertaining these facts.

The Chairman: It is moved and seconded to lay on the table that portion of the committee's report relating to the apportionment of expenses——

Mr. Woodruff: May I ask further if it is designed to lay on the table the matter for another year or is there——

The Chairman: The motion, as I understand it, was to lay that portion of the committee's report on the table until another year.

854 Mr. Wheeler: It seems to me, even from the remarks of those gentlemen who are not prepared to adopt the recommendation, that there will be no future light upon the matter. If this is admitted, that it is impossible to give anything but an approximate estimate, and, as has been stated here, that it is all guesswork, there is no use of postponing action on this question. That is the way it seems to me.

* * * * * * *

The Chairman: I think perhaps the gentleman had better withdraw his motion, as the discussion does not appear to have been concluded. If there is no objection we will continue the discussion.

* * * * * * *

Mr. Dey (of Iowa): * * * Now, I don't know that the form of question presented is exactly the correct thing, but I would like to see this question postponed for a year. That time will give the railroad journals, the business men interested, the railroad officials and everybody else a chance to give it full and fair discussion, and if they can satisfy us that these statistics are worthless to the commission or the world in reaching correct data, then we are willing to take this step and consider them worthless. I for one would be very desirous of voting with them. Certain information which has been asked and which we deem necessary has been refused, and we have

had to let it pass along without having any sort of chance to learn anything; besides, they attack us in the papers and in the railroad journals and everywhere else. The returns when made are of no value to us and don't pay. I feel very anxious about this matter, because the disposition of all these long roads—not the short
855 roads like some of those in New England, but these great roads that pass from State to State, whose officers say to us, 'Here are our gross earnings, here our gross expenses, and that is all we can give you in the matter of statistics.' That disposition seems to be growing. I do not mean to charge bad faith against anyone, but the lines have been gradually narrowed down, until now the reports of some of these roads, to say the least, are not particularly valuable.

* * * * * * *

Mr. Wilson: I represent the State of North Carolina, which has the power of making rates, and they have been uniformly adopted by our roads; we also have uniformity in railroad accounting. This gives us the information desired, which is furnished to us upon the printed form of the Interstate Commerce Commission, and I, for one, would be very loath to make any change in regard to the accounting methods pursued in our State. I have heard nothing from that Commission upon the proposed change in this report, and I would like to have the matter postponed for a period of twelve months. During that time we can hear from the parties interested, the railroad journals of the country, the newspapers, and all publications interested in the work, and be in better condition to determine upon that matter at that time.

The Chairman: The question comes up on Judge Fort's motion to lay that portion of the committee's report relating to the apportionment of expenses to passenger and freight traffic on the table for one year—to be considered another year. Shall I take the vote by yeas and nays?

856 Mr. Woodruff: I assume that this vote is to prevail. I would like, however, to have the gentlemen amend it in such form that it be referred to a committee, to be reported at the next meeting. I may assume to say that my associate's modesty is equal to his wisdom, and I say this in his behalf: The committee having this matter in charge have served, some of them, for a year or so, and I would like to suggest that a new committee be appointed to take charge of the subject and to consider the matters contained in this discussion under the varying circumstances of other States. I think this would be desirable, instead of its going back to the same committee.

Mr. Freeman: Let us decide this matter one way or another, and if we make a mistake it can be corrected. When we go out from here and are asked what we have done we do not want to say that we have done nothing. Here we have had a committee that has been at work upon this question for three years, that has always been open and ready to receive communications from both sides, and

given it a very full and exhaustive consideration, and made a unanimous report; it does not seem to be a wise thing to postpone it for another year and have another committee begin and go over it again. * * * It seems to me that, inasmuch as the railroads themselves admit that they cannot properly divide these expenses, it is an unfair thing to use those figures either for or against the railroad company. I trust we will decide this matter today.

Mr. Seymour: Before that vote is taken I would like to make a brief statement in regard to the position of the committee. One member of the committee has been serving in this capacity for three years, considering this question; two members of the com-
857 mittee have served for two years. Last year we made just such a report as is contemplated by this motion—a report postponing definite action upon the subject until we could see a little more of the working of the system. We felt that it was due to the Convention which appointed us this year that we should report our conclusions upon this subject after so long and patient an investigation. I am here to urge the Convention to adopt our conclusions. If the facts presented in that report were in any way questioned or assailed the members of the committee would be heard from in defense of it, because we think we have the facts before us to substantiate our position. We have the unamimous opinion of the accounting officers that it is impossible to ascertain—even to approximate—the cost of freight and passenger traffic respectively. We have the opinion, if I may state it, of the statistician of the Interstate Commerce Commission to the same effect. We have the opinion of the chairman of the commission—the late chairman of the commission—positively to the same effect. All of the communications which came to use were to that effect; that instead of being approximately correct in many instances the rule working on certain roads would show that certain kinds of traffic was done at a loss when it was absolutely known that there was a profit. The committee could not see how such a rule was of any use to the Convention, and therefore recommended its abandonment. We are *out*, as I said before, desirous of prolonging this discussion. The committee does not wish to urge upon the Convention the adoption of its views, but we thought it just to ourselves that we should report our conclusions and leave you to act upon the subject.

* * * * * * *

858 The Chairman: The motion is to lay on the table that portion of the committee's report relating to apportionment of expenses between passenger and freight traffic.

The yeas and nays were called for and the Secretary called the roll. The result was announced—yeas, 18; nays, 18. So the motion, the chairman having voted, was lost.

Mr. Walsh: Mr. Chairman, I move the adoption of the report.

Mr. Fort: I move as a substitute to recommit, with instructions to the committee to report at the next Convention.

* * * * * * *

I ask a vote on the motion that the report be recommitted to a committee of seven, to be appointed by the Chairman, to report to the next annual Convention.

The yeas and nays were ordered and the Secretary called the roll. The result was announced—ayes, 21; noes, 14. So the motion was agreed to."

From the Report of the Committee on Uniformity of Railway Accounts, Proceedings of Fifth Annual Convention of Railroad Commissioners, 1893:

(Page 41:)

"Your committee, to whom was referred that part of the report of the Convention on Uniformity of Railway Accounts to the Convention of 1892, recommending that the assignment of expenses to freight and passenger traffic be discontinued, and also the transfer of certain items, etc., beg leave to report as follows:

859 First. We recommend the adoption of that part of the report of the committee made to the Convention of 1892, providing for the discontinuance of the assignment of expenses to freight and passenger traffic. This to take effect July 1, 1893.

* * * * * * *

With the submission of this report your committee respectfully asks to be discharged.

A. K. TEISBERG, *Minnesota;*
J. H. PADDOCK, *Illinois;*
THOMAS THOMPSON, *Wisconsin;*
WILLIAM BECKMAN, *of California,*
Committee on Uniformity of Railway Accounts.

(Mr. Beckman filed a letter agreeing to first part of report only.)

The Chairman: Gentlemen; you have heard the report; it is open for discussion and consideration.

Mr. Brown, of Pennsylvania: I move that the report be adopted.

* * * * * * *

Mr. Clifford: I will state to the Convention that some of us were absent at the time the motion was made by Mr. Brown that this report be adopted. I suppose the effect of the adoption of this report will be to change our present form to correspond to the suggestions of this report.

* * * * * * *

Mr. Riebenack: The changes which will result from the adoption of this report will introduce some new accounts in the classification of expenses. The subject has been gone over very carefully

860 by the committee. The members of the Association of Railway Accounting Officers, as well as the accounting officers of

railroads not presented in the Association, received copies of the proposed changes and were invited to make recommendations and suggestions. The committee were thoroughly convinced of the reasonableness and propriety of introducing the changes that were suggested. The Association of Accounting Officers had the matter before them, in a report of their executive committee, in which they advised the Association fully on the suggestions they had made to the Committee of the Railroad Commissioners, and their recommendations were unanimously approved by the Association. The general opinion was that the classification, with the changes, would harmonize better with present accounting methods than the old one.

In answer to Mr. Hillyer's question, I would say that the adoption of this report will involve some changes, and it was so understood by the committee making the report, and by the Association of American Railway Accounting Officers.

The Chairman: Gentlemen, is there anything further that you have in mind in relation to this question; if so, we would be glad to hear it.

Mr. Brown, of Pennsylvania: I would state that this is the second time that committees have been appointed on this subject. You remember they reported two years ago, and those who have the Proceedings of the Convention held then will find the arguments that were made in favor of the adoption of this report. The Convention, however, at that time, did not seem ready to act upon it,
and referred the matter to another committee appointed by
861 the Convention held one year ago, and that Committee have
again reported in favor of making the changes suggested.

The Chairman: Anything further, gentlemen? If not, the question is upon the adoption of the Committee's report.

The report was unanimously adopted."

From the Report of the Standing Committee on Corporate Fiscal and General Accounts, Twenty-eighth Report of the Association of American Railway Accounting Officers, 1913:

(Page 22:)

"The report of the Standing Committee on Corporate Fiscal and General Accounts was received, considered section by section, the following action taken thereon, and adopted as a whole.

Section First.

Relative to Statistics—General. Received.

Relative to Statistics—Division of operating expenses between passenger service and freight service. The following resolutions of the Committee were approved.

Resolved, That this Committee concurs in the view expressed by the Special Committee on Corporate Fiscal and General Accounts in the year 1906, and that this Committee, after due and deliberate con-

sideration, reiterates that no fixed rule for the division of common expenses between freight and passenger can be devised which will be equitable to all carriers, to the same carrier under all conditions or to all divisions of the same carrier; and be it further

Resolved, That the attention of the Commission be called to the fact that even the partial separation suggested by the Commission of stating the amount of expense directly assignable to freight or passenger will involve some additional expense to the carriers, with no appreciable benefit to the Commission.

* * * * * * *

862 Since that time the sub-committee, as well as the full Committee, has diligently pursued the matter in co-operation with representatives of the Commission. The subjects thus far presented to your Committee in respect to the general question are:

(1) The determination of those operating expenses which may be directly allocated to:
   (*a*) Freight Service.
   (*b*) Passenger Service.
   (*c*) Service common to both freight and passenger service; or, in other words, those expenses which cannot be accurately assigned to either Freight or Passenger Service.
   (*d*) Consideration of fixed formulæ or rules for allocating common expenses to Freight Service and to Passenger Service.
(2) Traffic Statistics.
(3) Modification of the form of annual report to the Interstate Commerce Commission, which carries with it consideration of the various statistical tables therein required.

Your Committee submits the following report upon each of these subjects:

Subject: Statistics—Division of Operating Expenses between Passenger Service and Freight Service.

In reference to the question of the allocation of operating expenses to passenger service and to freight service, your Committee presents the following:

Whereas, Commissioner B. H. Meyer, in his letter to the Presidents of sundry railroads, in referring to division of operating expenses between passenger and freight used the following language:

"I am advised that the question of separating expenses among the different branches of the business has been raised. This idea is as old as the railroads. I believe such a separation should be undertaken as far as it can be correctly done without unnecessarily suggesting misleading conclusions. I have long felt that every useful scheme of operating statistics rests upon such a separation. I regard this separation as fundamental, and unless hitherto un-

thought of objections can be raised, I assume that all the carriers will cooperate in doing it in the future, as some of them have done it for many years past. A beginning could be made by reporting all expenses which are assignable to passenger, freight and other branches of the business under existing classifications.

863

All those expenses which cannot be directly assigned, should be reported unassigned, unless the carriers voluntarily desire to submit a complete apportionment. Such apportionments have been made very elaborately for important systems and the Commission would certainly wish to get the benefit of this work; but I should be opposed, for the present at least, to any plan looking toward the assignment or apportionment of all expenses of every class to the respective branches of the business in reports to be made to the Commission. If the Commission is in possession of the figures representing expenses which are actually assignable, it can, if necessary, go beyond this, stating for the information of all concerned, the bases more or less arbitrarily adopted for common items, and the reason for their adoption in every individual case. I should be inclined to recommend the adoption of a report *from* which will leave it optional with the different carriers to report separately only the assignable expenses, leaving common expenses unapportioned, or to report a complete apportionment. In case the latter alternative is selected, however, each carrier should be required to state the basis upon which it made its apportionments and the reason for adopting that particular basis."

And Whereas, In his remarks before a Subcommittee of this Committee at Washington, D. C., February 8, 1912, he reiterated that opinion, using the following language:

"One of my suggestions was that, putting aside all controversy with respect to the separation of expenses between the different branches of the business, carriers might report all expenses assignable to passenger, freight and other branches of service under existing classifications. As I see it from the point of view of the Commission, I feel that this is fundamental. * * *.

It is axiomatic with you that before we can have anything in the way of cost, we must have a separation of expenses. Then, of course, you come into the complicated question of mixed expenses and expenses that cannot be allocated. What would help the Commission is the expenses that can be allocated and then enter into those that cannot be allocated. It would help if some companies would report all expenses which are actually assignable, designating other expenses as unassignable, unless they desire to submit a complete apportionment, stating the basis used. If 20 roads make such returns, it is quite possible that in those 20 there will be suggestions enough to lead to uniformity for 50 next year. So in working along these matters will develop. If we would put ourselves to the problem like the people in the manufacturing business have put themselves to the problem, I am inclined to believe we could make headway. I realize those differences that exist, and yet the fact remains that they too have these arbitrary apportionments to deal with. * * * I did not mean to convey the im-

pression that I had in mind to apportion 100% of the ex-
864 penses between different classes. In my written communications I intimated that I would oppose it. * * * As for the apportionment of expenses between freight and passenger; they might be divided as far as possible and then the common expenses put in a pot, so to speak. * * * I should hope that the matter of division between passenger and freight should not cause you to pause too long in the elaboration of our operating statistics. In the separation between passenger and freight, here are certain things that have been definitely apportioned to passenger, say 40 per cent., and that leaves 60 per cent. unapportioned. No one can use that. The present proposition is to separate the 40 per cent. and then leave 60 per cent. to any one interested in making the additional separation."

And whereas, The question of formulating rules for the division of operating expenses between freight and passenger was discussed by the Special Committee on Corporate Fiscal and General Accounts prior to the promulgation of the present classification of Operating Expenses, at which time, after full consideration, it was decided that no fixed rules could be made which would apply alike to all railroads under the varying conditions.

And whereas, This Committee has formulated the following (mentioned) text indicating the items of operating expenses under the existing classifications, which are directly assignable to freight or to passenger, and the question of apportioning expenses common to both classes of service has now been brought before this Committee.

And whereas, While in practical experience some carriers have made division of expenses between freight and passenger, this has been true only in specific cases and subject to the individual judgment of the party making the division. Therefore, be it

Resolved, That this Committee concurs in the view expressed by the Special Committee on Corporate, Fiscal and General Accounts in the year 1907, and that this Committee, after due and deliberate consideration, reiterates that no fixed rule for the division of common expenses between freight and passenger can be devised which will be equitable to all carriers, to the same carrier under all conditions or to all divisions of the same carrier, and be it further

Adopted.

Resolved, That the attention of the Commission be called to the fact that even the partial separation suggested by the Commission of stating the amount of expenses directly assignable to freight or passenger will involve some additional expense to the carriers, with no appreciable benefit to the Commission.

Adopted.

Your Committee, after full consideration, having in mind the facts and conclusions above expressed, formulated a tentative text of those items which directly and in the ordinary course of business

allocate themselves to one of the three classes of service, i. e.,
865 Freight, Passenger *of* Common. Such text was reported in Bulletin No. 59 of November 25, 1912, a copy of which is, with this report, submitted to each member of the Association. It should be borne in mind that the text referred to was produced from the Classification of Operating Expenses now in existence and may not fit or meet the requirements of the tentative Classification of Operating Expenses now under consideration.

Your Committee wishes to call your especial attention to its findings in respect to item (*d*); that is, the determination of a fixed rule or formula for allotting common expenses to either Freight or Passenger Service.

Your Committe desires also to advise you that it has had brought to its attention the possibility of the Commission requiring carriers to report their operating expenses in the three classes named, i. e., Freight, Passenger and Common, instead of as totals, as heretofore.

It is of great importance that these matters be given careful and thorough consideration by the Association, to the end that the Interstate Commerce Commission may be given the benefit of the best judgment of the Association upon them.

* * * * * * *

Report of Special Committee to Attend Convention of National Association of Railway Commissioners.

As Received.

Chicago, March 19, 1913.

Mr. M. P. Blauvelt, President of Association of American Railway Accounting Officers, Chicago, Ill.

DEAR SIR: Since the last meeting of our Association, this Committee has attended the 24th annual convention of the National
866 Association of Railway Commissioners, held in Washington, D. C., on November 19, 20, 21 and 22, 1912.

The report to that Convention by its Committee on Statistics and Accounts, of which your chairman is a member, dealt with

Assignment of Revenue and Expenses by State Lines.
Study of Terminal Operations.
Analysis of Operating Expenses.
Revision of Annual Report Forms.
Standard Classification of Accounts.
Annual Report Forms for Express Companies.
Wage Statistics.
Efficiency.
Quality of Service, and
Traffic Statistics.

The Railway Commissioners' Committee, in its report, expresses some discouragement in the matter of the 'Assignment of Revenues and Expenses by State Lines,' but was of the opinion that a solution

might be found by giving up the attempt to adopt a straight mileage pro-rate of earnings and substituting therefor a plan allowing something for the terminals, and after deducting that allowance from the revenue, apportioning the remainder on a mileage pro-rate. It will be difficult to find a proper basis for terminal deductions, and one which will be acceptable to the different states.

The study of 'Terminal Operations' was undertaken partly with the idea of its assistance in apportioning revenue to states, and partly for the purpose of determining what is the cost of operating at the different termini.

The 'Analysis of Operating Expenses' appears to have for its object the determination of the cost of different classes of service. Your committee is in sympathy with the idea of service costs where obtained for the purpose of comparing efficiency of operating department representatives under exactly similar circumstances and
867 conditions, but believes that the attempt to determine costs for the purpose of measuring reasonableness of rates will eventually be abandoned.

In attempting to make a 'Revision of Annual Report Forms' there is danger that the Commission will call for information entailing great expense on the railroads. The intention seems to be to obtain figures which will measure the efficiency, quality of service, and the intricacies of the traffic movements on the various roads of the country. Your committee is of the opinion that such figures will not answer the purpose of the Commission, and that if the railroads are obliged to compile the information, year in and year out for the Annual Reports, the expense will prove to be very burdensome and not justifiable.

Respectfully submitted,

L. A. ROBINSON.
J. A. TAYLOR.
C. I. STURGIS, *Chairman.*"

Q. Mr. Parker, will you produce the fifth annual report of the statistics of the Interstate Commerce Commission, entitled "Statistics on Railways in the United States, 1892." Will you read into the record from that report what is set forth on pages 86 and 87 with reference to the division of operating expenses between freight and passenger?

Mr. Eldredge: Objected to as irrelevant and immaterial, having no bearing on any subject at issue in this case, and as patent also, not the best method of proof.

The Master: What do you claim that this proves?

Mr. Wykes: This is the action that the Interstate Commerce Commission took subsequent to this action of the Railway Commissioners. This has been testified to by Mr. Delf and by Prof. Adams, but nowhere has the exact language with regard to it that appeared
868 in the report been put into the case; that is, Mr. Butler called for it from Mr. Delf; he thought it was material; and I called for it from Prof. Adams because I thought it was material, and if we

both think it is material I think we ought to get the printed history on it.

A. Commencing on page 86, second paragraph:

"Two important changes in the original form have been adopted since 1888. The first of these pertains to the method of making an exhibit of the financial condition of railways. It was at first attempted to secure from the carriers a statement upon a cash basis of all receipts and expenditures during the year. Receipts of the year were classed as 'Resources' and expenditures as 'appropriations of resources.' It was found impossible to secure from the carriers a satisfactory statement of this nature. The accounting officers as a rule keep no record of payments and receipts and such a statement if it could be made, was likely to misrepresent the financial condition of the corporation at any particular time. It was recognized that sound methods of accounting ought to show the credits and liabilities of a corporation at the exact moment when a report is called for, and this can only be done by a statement of accruals of assets on the one hand and of liabilities on the other. This modification was in line with the methods of accounting of the best managed railways.

The second change was the abandonment of the attempt to assign operating expenses to passenger and to freight traffic, respectively. This assignment was introduced by the railways many years ago, when the difference in the character of the two services was so marked as to permit it to be made with a fair degree of accuracy.

With the development of railway economy, however, which
869 has resulted in increasing the rapidity of freight trains and the weight of passenger trains, it has been found that not more than half of the items of operating expenses can by any means be assigned to passenger and to freight service. This fact, taken in connection with the fact that the average cost per ton per mile and per passenger per mile, which was obtained upon the basis of the computation in question, was rarely used by Commissioners in judging of fair rates, induced the Railway Commissioners to abandon this classification. The cost per ton per mile and per passenger per mile will be published for the last time in the report for the year ending June 30, 1893."

Q. Will you produce the report of the Association of Railway Accounting Officers of the United States for the year 1913, being the 28th report.

Mr. Eldredge: Object to it, or to the introduction of any part of it, for the reason that it does not prove itself, or that it is published by any authority that makes it competent evidence.

Mr. Wykes: I ask to have the book marked as an exhibt. (Book referred to marked Defts.' Ex. 97,—should be 69,—Parker, June 2, 1914.

Mr. Eldredge: I object to it further for the reason that it is irrelevant and immaterial.

The Master: What is the evidence of the authenticity of that that you produce?

Mr. Wykes: I don't know as there is any evidence other than the fact that it is the printed copy of the reports of the Association of Accountants found in all of the railroad offices, procured by us from a railroad accountant and given to us as being the authentic printed copy of the proceedings. I don't know of any copy more authentic.

The Master: Your objections extended to that point as I understand it, that this was not an authenticated document?

870 Mr. Eldredge: Yes, sir. It does not prove itself in any way, has *not* certificate of any kind that under any rule of evidence permits it.

Q. Where did you get the book?

A. That book was given to me by an accounting officer of one of the largest railroads entering into the city of Detroit.

Q. What did you ask him for?

A. I asked for the last report of the American Association of Railway Accounting Officers. I might state that I endeavored to get it from Mr. Phillips direct, the Secretary of the American Association, but unfortunately they had sent out their entire supply. I have seen the same volume in libraries in Chicago.

Q. You have seen the same volume in what libraries?

A. In John Grearrar library in Chicago.

Mr. Wykes: I desire to offer in evidence the part of this report found between pages 97 and 105, which refers to the division of expenses between passenger and freight, and which is as follows:

Mr. Eldredge: I object to the reception of any part of the contents of the volume for the same reason that I objected to the volume, and for the further reason that the views of Commissioner Meyer expressed in a letter are not admissible in evidence. If the facts he testifies to are material, he should be produced, so as to be subject to cross examination.

From the Report of the Standing Committee on Corporate, Fiscal and General Accounts to the Twenty-Fifth (1913) Annual Meeting of the Association of American Railway Accounting Officers, as adopted.

"Your Committee has held three meetings during the current year, as follows:

871 French Lick, Ind., November 13 and 14, 1912.
Washington, D. C., January 9 and 10, 1913.
Atlantic City, N. J., April 1, 2 and 3, 1913,

and begs to report the following results and conclusions reached by it, which are respectfully submitted for your consideration.

First.

Subject: Statistics—General.

This general subject, dealt with but briefly in the 1912 report, is, in the opinion of your Committee, of such importance as to war-

rant a full explanation of its history at this time, to the end that the Association may be made fully acquainted with the Committee's work in respect to it, as well as its present status.

During the autumn of 1911, the Interstate Commerce Commission, through Commissioner Meyer, addressed letters to chief executive officers of various railways similar to the following:

'The Interstate Commerce Commission has under contemplation a revision of the blank forms whereon it receives the monthly and annual reports of steam railway carriers, and in connection therewith a careful consideration of the matter of railway operating statistics seems advisable. The Commission recognizes that in this work the expert knowledge and advice of railway officers would, if accorded, be of great assistance.

'The purpose of this note is to express the Commission's appreciation of the valuable aid which has been heretofore rendered in many ways by representatives of the railways, and particularly in the matter of developing the Uniform System of Accounts now nearing completion so far as relates to Steam Railways, and also to advise that if similar aid could be given to the Commission in the revision of its annual and monthly report forms and in the development of an adequate scheme of operating statistics, such aid would not only be highly appreciated by the Commission, but it would make possible a more perfect piece of work than could be otherwise achieved.

'The Commission believes that the best results can be reached by making a thorough study of the subject in all of its phases by the Commission's representatives and the representatives of the Railways in co-operation, bearing in mind all matters of importance that may be in any way affected by publicity of reports and the various uses to which operating statistics may reasonably be put.

872 'A few phases of the general plan of the Commission are fairly well defined and the status of its official work in this respect is such that prompt action is deemed advisable. For the most part, however, the Commission has determined upon no fixed line of action nor plan of procedure with respect to either the report forms, or the development of operating statistics.

'A letter identical with this is sent to the President of every other railway represented upon the Committee on Corporate, Fiscal and General Accounts of the Association of American Railway Accounting Officers.'

Apparently the replies received by the Commissioner to such letters made inquiry as to the details desired and the scope of the work to be undertaken. This assumption is based upon a subsequent round letter issued by Commissioner Meyer in December, 1911, a copy of which follows:

Interstate Commerce Commission,

Washington.

December 2, 1911.

DEAR SIR: Partly in acknowledgment of the last letter received from executives of railways represented on the Committee on Corpo-

rate, Fiscal and General Accounts, and partly as a supplementary answer to earlier replies, I am addressing this communication to the presidents of all the railways represented on that Committee.

At the outset I am pleased to be able to report that the replies to all the communications from this office show a gratifying spirit of cooperation with proposed work.

In one form or another, quite a few of them express the desire of receiving from the Commission more specific suggestions with respect to the lines of inquiry to be pursued. This request is a very fair and reasonable one, and I therefore beg to be permitted to submit
873 certain suggestions. It must be borne in mind, however, that these suggestions come from me personally and individually, and not from the Commission as a whole, although I have every reason to believe that my colleagues will endorse the general plan herein outlined whenever the same may be presented in its elaborated form for official approval.

All the different lines of inquiry suggested heretofore, and every line of investigation which may be suggested herein, constitute, after all, only a single large problem, namely, the problem of analyzing operating expenses and of reporting the results of the statistical compilations showing this analysis, in the most practicable and useful manner.

Attention has frequently been directed to the relative futility of requiring small local roads, that are technically interstate in character, to make annual and other reports which are in every respect identical with those required of the largest systems. It seems to me worth while to deliberate, at least briefly, upon the expediency of classifying interstate carriers into two or three different classes, and requiring simpler and briefer reports from the less important ones.

The Committee on Statistics of the National Association of Railway Commissioners was instructed to inquire, among other things, into the possibility of adopting a report form which will meet the requirements of the Interstate Commerce Commission, as well as the substantial requirements of the State Commissions. In other words, the aim is to unify all reports to such an extent that interstate carriers will compile only one report and send copies of this report to the Interstate Commerce Commission and to the State Commissions of the respective states in which they operate. The advan-
874 tages of a single report, if one can be devised, and adopted, are obvious, and it certainly is worth while to inquire carefully into this proposal.

A number of the replies received express the view that the present annual reports and the compilations based thereon, embrace items, columns or tables which have relatively little value compared with the time and expense required in their preparation. I believe that both the annual report form and the annual publication entitled 'Statistics of Railways in the United Stattes' should be very thoroughly examined with a view of eliminating all items, columns and tables which cannot be justified from the point of view of utility, effort and expense.

In the matter of operating statictics consideration should be given

to the necessity and feasibility of adopting certain new statistical units and of standardizing existing ones. Should such items as gross tonnage, locomotive service hours, etc., be compiled? Careful inquiry should be made to ascertain to what extent statistical units already adopted, or to be adopted, do not stand for the same thing in regard to different carriers. This suggestion is not made in the hope of securing compilations of statistics which are necessarily comparable at their face value for all the railways in the United States. It is to be presumed that all statistics must be interpreted in the light of the conditions under which the carrier to which they apply conducts its business. It should, however, be possible to secure figures which are comparable within these limitations.

Questions will doubtless be asked regarding the use to which these statistics shall be put. My answer is to whatever purpose
875 they can fairly and honestly be applied by any one whatsoever, whether Court, Commission, Railway Company, Bank Investor or private citizen.

Much has been said regarding 'Efficiency Accounting.' It is immaterial to me whether we use the term 'Efficiency Accounting,' 'Economy Accounting,' or 'Cost Accounting,' or any other proper descriptive term. They all come to the same thing, namely, a detailed analysis of operating expenses with a view of reflecting the actual results of operation and generally the creation of a statistical consciousness for every important operating property. From the point of view of a large class of controversies constantly being submitted to the Commission for adjudication, it is extremely desirable, almost vital, to have for consideration statistical information throwing light upon the cost of operation, both absolute and relative.

From the point of view of the railway companies as private organizations, it seems to me that carefully compiled statistical data will have value in many diverse directions. What operating official will not study with profit comparative statistics relating to fuel consumption, cost of labor, repair of equipment and many other similar items? I do not believe that any one can foretell or foresee the manifold ways in which statistical information of the character I have in mind can be applied with profit to all the parties who are interested in the conduct of the business. It is quite probable that many uses will be discovered as the work proceeds and as the results of this work accumulate year by year.

876 I am advised that the question of separating expenses among the different branches of the business has been raised. This idea is as old as the railways. I believe such a separation should be undertaken as far as it can be correctly done without unnecessarily suggesting misleading conclusions. I have long felt that every useful scheme of operating statistics rests upon such a separation. I regard this separation as fundamental, and unless hitherto unthought of objections can be raised, I assume that all carriers will co-operate in doing it in the future, as some of them have done it for many years past. A beginning could be made by reporting all expenses which are assignable to passenger, freight and other branches of the business under existing classifications. All those expenses

which cannot be directly assigned, should be reported unassigned unless the carriers voluntarily desire to submit a complete apportionment. Such apportionments have been made very elaborately for important systems and the Commission would certainly wish to get the benefit of this work; but I should be opposed, for the present at least, to any plan looking toward the assignment or apportionment of all expenses of every class to the respective branches of the business in reports to be made to this Commission. If the Commission is in possession of the figures representing expenses which are actually assignable, it can, if necessary, go beyond this, stating for the information of all concerned, the bases more or less arbitrarily adopted for common items and the reason for their adoption in every individual case. I should be inclined to recommend the adoption of a report form which will leave it optional with the different carriers to report separately only the assignable expenses, leaving
877 common expenses unapportioned, or to report a complete apportionment. In case the latter alternative is elected, however, each carrier should be required to state the basis upon which it made its apportionments and the reason for adopting that particular basis.

These are only general suggestions which may be regarded as talking points. I shall endeavor to follow the details of the deliberations of the Committee which is to undertake this work and to attend its sessions as frequently as possible. The Commission will be represented at all of these meetings by its Statistician and its Associate Statistician.

Very respectfully,

(Signed) B. H. MEYER,
Commissioner.

It would also appear that a majority, if not quite all, of the Chief Executives addressed delegated their Accounting Officer to pursue this work with the Commission, its representatives or with both; and acting upon such instructions, your Committee, at a meeting held in Louisville, Ky., January 8, 9 and 10, 1912, passed the following resolution:

Resolved, That a subcommittee of eight, of which the Chairman of this Committee shall be chairman, be appointed by such chairman, to confer with the Interstate Commerce Commission or its representatives, or both, on the subject of Statistics; such subcommittee to report to this Committee.

Since that time the sub-commitee, as well as the full committee, has diligently pursued the matter in co-operation with representatives of the Commission. The subjects thus far presented to your Committee in respect to the general question are:

(1) The determination of those operating expenses which may be directly allocated to:
   (*a*) Freight Service.
   (*b*) Passenger Service.

878 (*c*) Service common to both freight and passenger service; or, in other words, those expenses which cannot be accurately assigned to either Freight or Passenger Service.

(*d*) Consideration of fixed formulæ or rules for allocating common expenses to Freight Service and to Passenger Service.

(2) Traffic Statistics.

(3) Modification of the form of annual report to the Interstate Commerce Commission, which carries with it consideration of the various statistical tables therein required.

Your Committee submits the following report upon each of these subjects:

Subject: Statistics—Division of Operating Expenses Between Passenger Service and Freight Service.

In reference to the question of the allocation of operating expenses to passenger service and to freight service, your Committee presents the following:

Whereas, Commissioner B. H. Meyer, in his letters to the presidents of sundry railroads, in referring to division of operating expenses between passenger and freight, used the following language:

'I am advised that the question of separating expenses among the different branches of the business has been raised. This idea is as old as the railways. I believe such a separation should be undertaken as far as it can be correctly done without necessarily suggesting misleading conclusions. I have long felt that every useful scheme of operating statistics rests upon such a separation. I regard this separation as fundamental, and unless hitherto unthought of objections can be raised, I assume that all the carriers will co-operate in doing it in the future, as some of them have done it for many years past. A beginning could be made by reporting all expenses which are assignable to passenger, freight and other branches of the business under existing classifications. All these expenses which cannot be directly assigned, should be reported unassigned, unless the carriers voluntarily desire to submit a complete apportionment. Such apportionments have been made very elaborately for important systems, and the Commission would certainly wish to get the benefit of this
879 work; but I should be opposed, for the present at least, to any plan looking toward the assignment or apportionment of all expenses of every class to the respective branches of the business in reports to be made to this Commission. If the Commission is in possession of the figures representing expenses which are actually assignable, it can, if necessary, go beyond this, stating for the information of all concerned, the bases more or less arbitrarily adopted for common items and the reason for their adoption in every individual case. I should be inclined to recommend the adoption of a report form which will leave it optional with the different carriers to report separately only the assignable expenses, leaving common expenses un-

apportioned, or to report a complete apportionment. In case the latter alternative is elected, however, each carrier should be required to state the basis upon which it made its apportionments and the reason for adopting that particular basis.'

And whereas, in his remarks before a subcommittee of this Committee at Washington, D. C., February 8, 1912, he reiterated that opinion, using the following language:

'One of my suggestions was that, putting aside all controversy with respect to the separation of expenses between the different branches of the business, carriers might report all expenses assignable to passenger, freight and other branches of service under existing classifications. As I see it from the point of view of the Commission, I feel that this is fundamental. * * * It is axiomatic with you that before we can have anything in the way of cost, we must have a separation of expenses. Then, of course, you come into the complicated question of mixed expenses and expenses that cannot be allocated. What would help the Commission is the expenses that can be allocated and then enter into those that cannot be allocated. It would help if some companies would report all expenses which are actually assignable, designating other expenses as unassignable, unless they desire to submit a complete apportionment, stating the basis used. If twenty roads make such returns, it is quite possible that in those twenty there will be suggestions enough to lead to uniformity for fifty next year. So in working along these matters will develop. If we would put ourselves to the problem like the people in the manufacturing business have put themselves to the problem, I am inclined to believe we could make headway. I realize those differences that exist, and yet the fact remains that they too have these arbitrary apportionments to deal with. * * * I did not mean to convey the impression that I had in mind to apportion 100% of the expenses between different classes. In my written communication I intimated that I would oppose it. * * * As for the apportionment of expenses between freight and passenger; they might be divided as far as possible and then the common expenses put in a pot, so to speak.

* * * I should hope that the matter of division between
880 passenger and freight should not cause you to pause too long in the elaboration of our operating statistics. In the separation between passenger and freight, here are certain things that have been definitely apportioned to passenger, say 40 per cent, and that leaves 60 per cent unapportioned. No one can use that. The present proposition is to separate the 40 per cent and then leave the 60 per cent to any one interested in making the additional separation.'

And Whereas, The question of formulating rules for the division of operating expenses between freight and passenger was discussed by the Special Committee on Corporate, Fiscal and General Accounts prior to the promulgation of the present classification of operating expenses, at which time, after full consideration, it was decided that no fixed rules could be made which would apply alike to all railroads under the many varying conditions.

And Whereas, This Committee has formulated the following (men-

tioned) text indicating the items of operating expenses, under the existing classification, which are directly assignable to freight or passenger, and the question of apportioning expenses common to both classes of service has now been brought before this Committee.

And Whereas, While in practical experience some carriers have made division of expenses between freight and passenger, this has been true only in specific cases and subject to the individual judgment of the party making the division. Therefore, be it,

Resolved, That this Committee concurs in the view expressed by the Special Committee of Corporate, Fiscal and General Accounts in the year 1906, and that this Committee, after due and deliberate consideration, reiterates that no fixed rule for the division of common expenses between freight and passenger can be devised which will be equitable to all carriers, to the same carrier under all conditions or to all divisions of the same carrier, and be it further,

Adopted.

Resolved, That the attention of the Commission be called to the fact that even the partial separation suggested by the Commission of stating the amount of expense directly assignable to freight or passenger will involve some additional expense to the carriers, with no appreciable benefit to the Commission.

Adopted.

Your Committee, after full consideration, having in mind the facts and conclusions above expressed, formulated a tentative text of those items which directly and in the ordinary course of business allocate themselves to one of the three classes of service, i. e., Freight, Passenger or Common. Such text was reported in Bulletin
881 No. 59 of November 25, 1912, a copy of which is, with this report, submitted to each member of the Association. It should be borne in mind that the text referred to was produced from the classification of Operating Expenses now in existence and may not fit or meet the requirements of the tentative classification of Operating Expenses now under consideration.

Your Committee wishes to call your especial attention to its findings in respect to item (*d*); that is, the determination of a fixed rule or formula for allotting common expenses to either Freight or Passenger Service.

Your Committee desires also to advise you that it has had brought to its attention the possibility of the Commission requiring carriers to report their operating expenses in the three classes named, i. e., Freight, Passenger and Common, instead of as totals, as heretofore.

It is of great importance that these matters be given careful and thorough consideration by the Association, to the end that the Interstate Commerce Commission may be given the benefit of the best judgment of the Association upon them."

Mr. Wykes: I also wish to offer in evidence, and do so, the parts of the report found between pages 59 and 72, an address given by Mr. R. A. White, Auditor of the New York Central.

Mr. Eldredge: That is objected to for the same reason that I objected to the volume or any part of its contents, and for the further reason that it gives Mr. White's views without opportunity of cross examination.

Q. Will you produce the printed copy of the affidavits filed in this case on the motion for temporary injunction, and the affidavit contained therein between pages 4 and 10 made by Mr. Delf on July 24, 1911?

882 A. Yes, I have that.

Mr. Wykes: I wish to introduce that affidavit in evidence.

Mr. Eldredge: I object to it upon the ground that the single affidavit is not admissible in evidence unless all the affidavits covering the same subject are also introduced. I suggest, Mr. Wykes, that this affidavit be not written into the testimony, but, if it shall be found to be material, it may be referred to by either party from the original affidavit, forming a part of the files in the case. The printed copy may be used subject to correction by the original.

Q. Will you produce the record of certain methods for the division of expenses between passenger and freight prepared by J. P. Muller in the case of Boilleau against the Pittsburgh & Lake Erie Railroad Co.? All I want it for is for the purpose of showing the methods for the division of common expenses applied in other cases—just for the purpose of showing the diversity of methods and the details of methods in other cases. That will be marked Ex. 98 (should be 70.) That is the Muller that has already been referred to in the testimony.

Mr. Eldredge: Mr. Wykes, I understand that this volume which you have marked Defts.' Ex. 98 (should be 70) contains certain exhibits prepared by J. P. Muller purporting to show the methods adopted by different accountants for the allocations of operating expenses to passenger and freight service respectively in certain railway rate cases, and that you propose to introduce in evidence the matter contained on pages 11 to 122 of this Ex. 98 (70)?

Mr. Wykes: That is correct, for the purpose of indicating the methods applied in the division of operating expenses only.

883 Mr. Eldredge: We will not object to the method of proof; in other words, we won't object that this volume does not prove itself, but we do object to the introduction of the pages named for the reason that they are irrelevant and immaterial, and for the further reason that they would only be admissible in evidence if J. P. Muller were produced and an opportunity given to cross examine him.

Q. Will you produce the first annual report on the statistics of railways of the United States for the year ending June 30, 1888?

A. I produce a copy of that report, and I read in evidence from pages 17 to 19 inclusive the following:

Mr. Eldredge: I object to it as irrelevant and immaterial.

"As the previous table considered all forms of ordinary income, so this table includes all expenditures except such as are incurred for permanent improvements or betterments in the financial condition of the property. Expenditures are brought under the two heads of operating expenses and fixed charges.

To operating expenses are charged maintenance of way and structures, maintenance of equipment, conducting transportation, and general expenses; and in each case the amounts so charged are assigned to freight and to passenger service. Under fixed charges are included interest on bonds, rentals, and taxes. The table closes with estimates of expenditures for one passenger or one ton of freight carried one mile, and for the cost of running a passenger or a freight train one mile.

There are two questions of importance suggested by the analysis of expenses portrayed in Table IV. The first question has reference to the classification of expenses under the four heads stated above; the second pertains to the apportionment of expenses to passenger and freight service.

884 With regard to the first of these questions, as stated in the Commission's report, on page 67, 'the distribution into four general classes was determined upon as the most scientific and satisfactory of the various systems in use, while the subordinate heads under each class are so arranged as to require no important change from what is known as the Saratoga classification of operating expenses, which was agreed upon by a convention of State Commissioners at Saratoga, June 10, 1879, and which has been quite generally adopted in actual use.' And certainly where one looks into this classification it appears simple, adequate and workable; and it is a pleasure to add that many roads that have not previously done so are now adjusting their accounts to its requirements.

The question which arises in connection with apportionment of expenses between passenger and freight service is one that cannot be determined with such confidence. One point only respecting it lies beyond the limit of reasonable controversy, and that is that such apportionment must in some manner be made.

Not only is this demanded in the interest of comparative statistics, but it is of great importance for an intelligent judgment on relative freight and passenger charges. But when the proper rule for making the apportionment of expenses comes to be considered, it is necessary, in the presence of the many and conflicting theories entertained by competent railway accountants, to proceed with great caution.

The rule adopted by the Commission, as contained in its book of instructions for the guidance of carriers in making their annual reports, is as follows:

All expenses which are naturally chargeable to either freight or passenger traffic should be entered in their respective columns; expenses which are not naturally chargeable to either traffic should be apportioned on a mileage basis, making the division as be-

885 tween freight and passenger traffic in the proportion which the freight and passenger train mileage bears to the total mileage of trains earning revenue.

With few exceptions this rule has been followed by the carriers in making their reports, and the results exhibited in the tables show the manner of its working. There is, of course, no difference of opinion, so far as the expenses 'naturally chargeable to either freight or passenger traffic' is concerned. The difficulty arises in connection with such expenses as cannot be so apportioned. For example, how can it be determined what proportion of the cost of maintaining a road-bed in good order is chargeable to freight revenue?

The confusion that exists on this subject may be best indicated by stating the various theories respecting it. According to the rule given above, expenses which from their nature cannot be easily assigned are to be apportioned on the basis of train mileage. This is thought to allow more nearly than any other arbitrary rule for the varying elements of velocity and weight. If freight trains are heavier than passenger trains, the latter are ordinarily run at higher speed, and, as is well known, the 'pound' of a train on the rail is measured by its momentum, or the resultant of velocity multiplied by weight. Curves, grades, temperature, and other factors which vary with physical characteristics of the road or with the locality in which it is built, may be regarded as constant so far as freight and passenger service is concerned.

But this rule of apportionment fails to gain acceptance by many accountants who have had large experience in railway affairs. Some claim that an apportionment fair to all branches of the railway service is impossible. They who maintain this position assume that operating expenses should be taken as a whole, and they con-
886 ceive the whole duty of the manager to have been performed if at the close of the fiscal year there remains a satisfactory margin of earnings. It is urged by others that the only solution of the problem is to determine the ratio of apportionment for those items of expense that can be readily traced to passenger and freight service, and then to adopt this ratio for apportioning the other items.

This position is less satisfactory than the one previously stated, for it gives the appearance of a solution when in reality it is but an evasion of the problem. There are other accountants who use car mileage as the true basis of apportionment; others substitute for this engine mileage; still others declare that mileage run has nothing to do with the question, and that weight of trains alone should be considered. In German and Swiss statistics the number of axles in a train serves as the basis of most comparative and proportional computations, and it is possible that further study would reveal yet other theories.

In the presence of such divergence of opinion as is disclosed above, it is certainly well to refrain from hasty judgment. The question is one to be determined by careful investigation and comparative study. But in reading the letters of the several railway officers who have favored the Commission with arguments upon this subject, one thought has presented itself that may prove the source of fruitful inquiry. It happens that the several accountants who hold the theories referred to are officers of roads that differ widely in their physical characteristics, as also in the nature of the competition to

which their business must conform. In one case the road-bed is straight and over a level country, in another there are sharp curves and heavy grades; one road is obliged to depend for supremacy
887 upon fast; another, running through country sparcely settled, can run its trains according to requirements of economy; the average temperature and humidity, also, which must affect somewhat the wear and tear of structures and equipment, are different for the several roads. Now, it is possible that divergence of opinion as to the proper method of apportioning expenses between freight and passenger service is due to the varying conditions under which the problem has been considered; and if this be true, it is of course impossible to discover any single rule to satisfy the problem. This can only be determined by applying the several rules under different conditions and comparing the results.

Such a method of procedure would be scientific, and must lead to trustworthy results. It is proposed in this office to undertake such an investigation.

888 On June 26, 1914.

PARKER recalled.

Further redirect examination.

By Mr. Wykes:

Defts.' Ex. 74, Parker, is the details of ratios, and pages 1 to 52 contain the detailed working out of the gross ton mile ratios 1, 1*a* and 1*b* for 1913 according to the method of Thompson. Defts.' Ex. 77, Parker, is a copy of the assignments and allocations of the 1913 expenses on the Thompson plan or basis. It comprehends the application of the ratios for 1913 to the expenses of plaintiff for that year.

There are three variations shown from 1912 to 1913 in the application of the ratios. The first is that I used for account No. 2, Ballast, a six-year average, instead of a five-year average as used by Thompson in 1912; that is shown on page 57 of Ex. 77.

In account No. 9, Bridges, Trestles and Culverts, I reduced the total by $20,986, cost of betterments included in operating expenses, as testified to by Mr. Delf.

For account No. 55, Advertising, page 105 of Ex. 77, I distributed the account relatively with the distribution of the same by Mr. Heiss for 1912.

For account No. 54, I accepted Delf's assignments or allocations, the data being taken from Defts.' Ex. 48, Delf. This account is Outside Agencies.

The tables in Defts.' Ex. 77, Parker, are comparable with those in Defts.' Ex. 72, Thompson, page for page, and, if there is any variation in accounts, it will show up.

The sixth year which I used for 1913, in averaging ballast by including 1913, was not available when Thompson arrived at his average in 1912. The expenditures for ballast, 1908 to 1912 in-

889 clusive, were $19,947.53, an average per year of $3,989.50. The inclusion of the 1913 expenditures, of $25,938, almost doubled the average.

Ratio 2, 1913, of equated track miles, shown common passenger and freight as 86.27%, freight and ore, 13.57%, and exclusive passenger, .16%. Mr. Thompson's attention was called to some testimony, which came into the case after his ratio was arrived at, indicating that a part of the exclusive freight trackage was maintained by the industries served thereby, which made a slight difference in his percentage. My percentage for Ratio 2 was arrived at without separating the tracks maintained by the industries. Separating that trackage, results would be, common freight and passenger, 87.26%, freight, 12.58%, and passenger, .16%. The change would not make a difference of over $150 in the intrastate passenger costs.

The expenses used as the starting point and divided in Ex.. 77 are taken from Delf's exhibits or from the books of plaintiff. Ex. 77 correctly represents what it purports to show, though there is one error, to which Delf has called attention, that may affect the result in the intrastate passenger business $2,000.

I am referring to the item "Superintendence," where there is an apparent error of $1,338. The error, if such, will by correction result in increasing the passenger cost approximately $2,000. It is purely clerical, as the result of misreading an amount.

In Ex. 77, it was my effort, design and attempt to correctly apply the Thompson method of assignment and allocation, and to produce correct results on that method. I have done everything I could to avoid error. (Defts.' Ex. 77, Parker, introduced in evidence.)

890 The division of Ex. 77 which states a part of the cost of operation of sleepers and diners, including the roadway and other costs incident thereon, includes the foreign Pull sleepers and diners.

In Ex. 77, I varied from Thompson's 1912 assignments, in that I assigned a part of the item "Docks and Wharves" to Michigan passenger business, while he excluded that entirely, on the theory of its being connected with the separately-operated property. I included it, accepting Delf's passenger assignments, assigned it on the basis of passenger cars passing over the dock, and subdivided in to passengers and baggage, mail and express, and sleepers and diners.

PARKER.

Cross-examination.

By Mr. Cotton:

The 1913 ballast figures would be first available about Oct., 1913. In account 81, Enginehouses and road expenses, I did not include the mileage of helpers and pushers, nor did Thompson.

The C. & N. W. train brings a sleeper, destined for Marquette, which comes on to the line of plaintiff at Negaunee; that car is transferred to the C. & N. W. train at Negaunee, to be pulled down to Marquette; that train is No. 110. The train that brings the sleeper to

the South Shore, when it comes on to the tracks of South Shore at Negaunee, becomes No. 3.

There is a somewhat similar operation at Champion, where the C. M. & St. P. connects with South Shore, and brings a train to the South Shore in which they have a sleeper for Marquette, which is picked up by No. 10, I believe, and carried to Marquette.

891 At Marquette, for this train No. 10, and for train No. 110, the switch engine has to take those sleepers from each of the trains and spot them over on a sidetrack, near the station. At night, about five o'clock, those sleepers are again set up into a train—No. 11—and moved back, the C. & N. W. sleeper being carried to Ishpeming, where transfer is made to the C. & N. W., and the St. Paul sleeper being carried back to Champion, where the transfer is made to the St. Paul.

In the dining service of those C. & N. W. and C. M. & St. P. trains which are under D. S. S. & A. power, the diners have been set off at various places, one time and another, but I think the more recent operation is to set them off at Houghton, and set them in again at Houghton.

Train No. 7 brings a sleeper from the Soo to Marquette; that sleeper is dropped at the station. I have never observed the entire operation by which it is again taken up by No. 8 and carried back to the Soo. After it is dropped from No. 7, it must be placed in position so it can be easily attached to No. 8 when it goes east.

There is always a transfer of sleepers at Soo Jct. twice a day. In each instance, it is taken out of the train on which it comes to that point and put into another train. The switching operations by which these cars are put on to the boat at St. Ignace is complicated by heavy cars and sleepers and diners.

The outside operations account is not burdened with any of the transportation expenses or the expense of such movements as described. There is no separation of the cost of switching or wear on the track, or such things, and no way to get at the cost, except on some basis of apportionment or assignment.

892 (All of the various exhibits marked as defendants' exhibits throughout the case are introduced in evidence, subject to objections made thereto in the course of the proofs.)

(This witness was later called to testify before the Court.)

UNITED STATES OF AMERICA,
Eastern District of Michigan, ss:

I, Elmer W. Voorheis, Clerk of the District Court of the United States for the Eastern District of Michigan, do hereby certify that the above and foregoing is a true copy of Volume 2 of Narrative Statement of Testimony on Appeal, comprising typewritten pages numbered three hundred and eighty-seven to eight hundred and ninety-two inclusive, in the therein entitled cause as the same appears on file and of record in my office; that I have compared the same with the original, and it is a true and correct transcript therefrom and of the whole thereof.

In testimony whereof, I have hereunto set my hand and affixed the seal of said Court, at Detroit, in said district, this twenty-first day of November, in the year of our Lord one thousand nine hundred and eighteen, and of the Independence of the United States of America the one hundred and forty-third.

[Seal of the U. S. District Court, Eastern District of Mich.]

ELMER W. VOORHEIS, *Clerk.*

893 Vol. 3.

On August 14, 1913.

Prof. HENRY C. ADAMS, a witness called by defendants.

Direct examination.

By Mr. Wykes:

I graduated from Iowa college, with the regular Bachelor's degree. I then graduated as a Ph. D. from Johns Hopkins University, with economics, finance and history as subjects. I then taught these subjects in Cornell University, Johns Hopkins University and University of Michigan, until 1887, when I went to the University of Michigan, taking a full appointment. In 1888, I became statistician to the Interstate Commerce Commission, remaining in charge of its statistical and accounting work until two years ago.

With regard to railway accounts, in addition to unifying the state reports, early in my connection with the I. C. C., after the Hepburn Act, in 1906, I took charge, for the Commission, of the unification of railway accounts in the United States, giving up two years from university work. Throughout all this time, I have had to do with the many technical and practical questions arising in governmental questions of railway supervision.

The classification of accounts of the Interstate Commerce Commission was entirely devised and put into force between 1888 and 1911, when I was its statistician. Of that, I had full supervision, so far as the I. C. C. was concerned. That work was done in co-operation with the accountants of the railroads of the United States. I had full supervision of that entire branch of the Commission's work, which began as the division of statistics and ended as the division of statistics and accounts; the accounts were added in 1907, after the Hepburn Act, the reason being that until that time the Commission practically had no control over accounts. I had full control over the development of that system.

894 I served as special expert of the Railway Mail Pay Commission, composed of members of the United States Senate and of Congress, and the report made has been regarded as the standard to this time. It is always used in subsequent discussions.

I was connected with the Michigan Railroad Appraisal of 1900, being responsible for the non-physical valuation; the appraisal was divided into two parts, the physical valuation and the valuation of the commercial evidence, or value in excess of the physical value. I was later connected with Michigan railroad appraisals of 1902 and 1905.

Since severing my connection with the Interstate Commerce Commission, I have had quite a number of statistical and accounting cases which required a general review of the principles laid down in the

I. C. C. system of accounts, and some having a bearing on the rate-paying ability of railroads.

I have studied the question of dividing costs in railway transportation, so as to get at the cost of the different characters of traffic; that is called the rule for specific costs for specific services. That was the first question I took up when I became statistician to the I. C. C., bearing upon the use of statistics in rate cases. I was a member of the committee composed of State and Federal Railway Commissions that recommended the abandonment of any attempt to separate expenses into passenger and freight. In recent years, I have had a great deal to do with that question. The most important case was when I prepared an analysis that criticized that theory in detail for the American Railway Association.

The abstract of my testimony in the Michigan railroad tax cases correctly sets forth matters bearing upon my qualifications as an expert, as follows:

895 2. Member of following societies:

Member and late vice-president, American Statistical Association.
Member and late president, American Economic Association.
Member, International Statistical Association.
Member, International Association for Procuring Uniform Legislation.

3. Writings (excluding pamphlets and articles) on subjects related to this inquiry:

History of Taxation in U. S., 1789 to 1816. (Translated into German.)
Public Debts. (Translated into Japanese.)
The Science of Finance. (Translated into Japanese.)
Statistical Reports of Interstate Commerce Commission, 1888 to 1902.
Compendium of Railways of the U. S., 1902 (3 parts).
Two Volumes on Transportation for U. S. Census Report of 1900.
Special attention given to subject of History and Evolution of Taxation of Railways in the U. S.

I was an expert agent in charge of transportation work in the United States Census of 1890. I was statistician for the Postal Service Commission in 1899; that is what I referred to as doing expert work for the Postal Commission.

Since the I. C. C. was created, there have been many attempts, and there are many different rules, for making separation of costs of freight and passenger business; many experts have attempted the separation, and, as a result, a great many different methods have been worked out. I have in mind eight or ten different methods for the separation between passenger and freight.

I was one of the committee recommending the abandonment of the rule of specific costs by the I. C. C., and the costs per ton and per passenger per mile were published for the last time in the report for

the year ending June 30, 1893; the recommendation was made a year previous to that time.

896 ADAMS.

Cross-examination.

By Mr. Eldredge:

In the absence of the record of purchases, I think a railroad is entitled, as a matter of justice and equity, to only the average value of the lands in the territory it serves, and it would give the railroad too high a value for its right of way to take sales of lands immediately adjoining the right of way.

That goes to the question of what element of railway property ought to be valued on the cost-of-reproduction theory. I deny, absolutely, that lands should be valued in that way. I think a thing that can be reproduced, like a locomotive, can be valued on the cost-of-reproduction theory, and a thing that cannot be made in unlimited quantities, at uniform cost, ought never to be valued along those lines. I think it is much better to take the average value of the property served than to take the contiguous property, to value the railroad land. I think it fairer to the public, and to the railroad, as well, as I do not concede anything which is unfair to one party could be fair to the other. I think there is a harmony of interest.

ADAMS.

Direct examination resumed.

By Mr. Wykes:

The rule for the ascertainment of specific costs for specific service at one time used by the I. C. C. is as follows:

"All expenses which are naturally chargeable to either freight or passenger traffic should be entered in their respective columns; expenses which are not naturally chargeable to either traffic should be apportioned on a train mile basis, making the division as between freight and passenger traffic in the proportion which the freight and passenger train mileage bears to the total mileage of trains earning revenue."

897 This rule was included in the instructions to the carriers for annual reports to the I. C. C. The division between passenger and freight service of the operating expenses was required for the last time in 1893, and appeared for the last time in the report of 1894. Preliminary to the abandonment of that rule, action with regard to it was taken in the meeting of the Association of Railroad Commissioners.

The resolution of the Association of Railroad Commissioners of 1892, voting to eliminate that requirement, was printed in the proceedings of the Association, which has always been printed by the I. C. C. It is not included in the report of the Commission to Con-

gress, nor are these proceedings included in the annual report of statistics to the Commission. I have not with me a copy of the entire resolution, but one paragraph of it is as follows:

"The test of actual practice fails to satisfy us that these rules are of any utility either to the companies, the States or the Nation. Indeed if not substantially correct they could not be expectetd to be useful and may prove positively vicious. We know that results have been reached by the application of these rules for division which are grossly erroneous, not to say preposterous."

Q. I think you stated that the division of expenses between various classes of traffic, such as freight and passenger, and interstate passenger and interstate freight, and intrastate passenger and intrastate freight, has been attempted a good many times by different experts?

A. Yes sir.

Q. And that those experts differ materially in the factors upon which they make their division of the common expenses?

A. That is true.

Some of the factors used by experts, in making the division of that portion of operating expenses that cannot be directly assigned to passenger or freight services, are: One factor is car mile-
898 age; another is the ratio of direct charges; another may be called the dollar of revenue method; another is revenue; another is locomotive mileage; another is the revenue train mileage; and there is one which is a combination of the locomotive mileage and the car mileage. Those are all of the factors I am acquainted with, although there are quite a number of minor principles adopted in the development of the full methods of various experts, but these are the leading factors, so far as I know them.

Train weights are used as a modifier in some of the methods, and some have made use of the time and use of track and property by the different classes of traffic, but the greatest use of that, as I understand it, is in connection with the localization of property to the various services, and not the separation of expenses; however, that has been used. I have studied the work of experts, or men professing to be experts, who have attempted divisions of costs. I have studied certain methods by different experts who make use of each of these various factors in greater or less degree in assigning common costs between passenger and freight. Some expert has used all of these factors, with the exception of the dollar of revenue method.

I have studied the rule promulgated by the Postmaster General in his method for separating between passenger and freight to arrive at the railway mail pay. I have studied the rule of Frank Nay, Auditor of the Rock Island, in the Advance Rate Cases before the I. C. C.; also the method of John G. Drew, Comptroller of the Great Northern, in a case before the I. C. C..; also the method of J. P. Muller in the Pittsburgh Coal Rate Case, and the method used by the I. C. C. prior to 1894; also the rule used by James Peabody, Statistician of the Atchison, Topeka and Santa Fe. Of course, some

of these men have appeared in many cases, and there are
899 other rules than these I have given. Hillman has made a great many assignments applying rules in the Ohio Lake Cargo Rate Case, in what is known as Hillman's Florida formula before the I. C. C., in Hillman's South Dakota formula before the I. C. C., in Hillman's Minnesota formula before the I. C. C., in Hillman's Hocking Valley formula before the I. C. C., and Hillman's formula in Norfolk & Western. These formulas differ as to the application of these fundamentals in the different cases. Hillman's rule varies with the cases. Mr. Worthington appeared as an expert in the Pittsburgh Vein Operators Association Case vs. Wheeling & Lake Erie on the division of costs, and applied a rule of his own.

There are many modifications of these rules. You could find variations in the application of these rules for almost every case that is tried. The factors referred to and enumerated are given varying weights by the different experts in the separation of common expenses between passenger and freight.

One expert gives principal weight to certain of these factors, and another gives principal weight to certain others; the different experts, in separating passenger and freight expenses, will give varying weight in applying these various factors; one will use car mileage as his principal factor, and another train mileage, and so on, through the list. The various methods of the various experts applied to the same property would bring very divergent results. I have investigated to determine the range of difference in the results.

I have taken the total operating expenses of plaintiff, and applied the percentages for these various principles that I enumerated, for the purpose of illustrating how divergent would be the results
900 of these various principles, when applied. I have applied it to the whole, instead of the common expenses, for the purposes of illustration, and the divergence of opinion, as to what constitutes a common expense, seemed to justify that method for the purpose of illustrating the point.

Rule.	Passenger assignment.		Freight assignment.	
	Amount.	%.	Amount.	%.
Car mileage	$289,698	14.5	$1,708,216	85.5
Ratio of direct charges	453,526	22.7	1,544,388	77.3
Dollar of revenue method	525,441	26.3	1,472,473	73.7
Combination of revenue and locomotive car miles	607,366	30.4	1,390,584	69.6
Revenue basis	657,314	32.9	1,340,600	67.1
Locomotive mileage	925,034	46.3	1,072,880	53.7
Revenue train mileage	954,903	47.8	1,043,011	52.2

The expenses taken for this illustration are for 1912, for Michigan; the various rules applying to the total expenses would lead to the above assignments.

I find that some experts vary the revenue train mileage basis by the inclusion of switching mileage. Certain of the items, with some experts, are divided on the basis of the revenue train mileage plus the switching mileage. The mileage of switching locomotives is

not a measured mileage, but a mileage of six miles per hour. I have found no expert who uses one of these factors straight, without combination with others, to make his divisions. Mr. Peabody, who takes train mileage as his principal factor, does that more nearly than any other expert I know of, but makes variations.

It is possible for the expert, by giving greater weight to a certain factor and less weight to a certain other factor, to increase or decrease, materially, the common expenses which would be assigned to a particular department, as to passenger or freight. The variations in assignments, in the cases which I have examined, I would
901 regard as surprisingly large. The range of variation in application of different methods to the operating expenses, or a block of the operating expenses, of the railroads of the United States has been shown by certain exhibits prepared by Mr. Muller in the Western Freight Rates inquiry. He applies seven methods; those methods are, as named by him:

Name.	Method.	Remarks.
James Peabody and Frank Nay.	Train miles.	
John G. Drew.	Revenue service locomotive miles.	
F. J. Moser.	Locomotive miles.	All switching assigned to freight.
Frank Nay.	66-2/3% on revenue, 33-1/3% on train miles.	
C. E. Schriber.	20% revenue train miles and switching 80% freight and passenger gross earnings.	He suggests that one is adjusted to wear and the other to weather.
Frank Nay, D. A. Worthington and C. W. Hillman.	50% train miles, 50% car miles.	
J. P. Muller.	50% locomotive miles including switching in freight, 50% car miles.	

Those methods were applied to maintenance of way and structures expenses for 1910 for all the railroads of the United States, being a total of $368,394,260. The greatest variation between the different methods is $74,981,384, passenger. That is between the James Peabody and Frank Nay train mile method and the J. P. Muller method, the former giving to passenger $171,321,530, whereas the other method gives $96,340,146. In the freight, the highest is
902 the Muller method, which gives $272,054,114, while the lowest method gives to freight $197,072,730. The method that is highest in assignments to freight is lowest in assignments to passenger, and vice versa.

Following is a table, by Mr. Muller, showing the results of allocation of $368,394,260 of maintenance of way and structures expenses

for all railroads in the United States for the year ending June 30, 1910, by different methods named, with greatest variation:

Name of accountant and method	Freight.	Passenger.
James Peabody & Frank Nay: Train Miles	$197,072,730	$171,321,530
J. G. Drew: Rev. Service Loco. Miles	205,630,234	162,764,026
F. J. Moser: Loco. Miles. All Swtg. to Freight.	236,955,019	131,439,241
Frank Nay: A 66⅔% Rev. B 33⅓% Train miles	242,183,958	126,210,302
C. E. Schreiber: A 20% Wear-Rev. Train-miles plus Swtg. miles 95-5 B 80% Weather Freight & Pass. Gross Earnings.	257,500,080	110,894,180
Frank Nay, B. A. Worthington & C. W. Millman: A 50% Train-miles B 50% Car-miles	257,572,222	110,822,038
J. P. Muller: A 50% Loco. Miles incl. Swtg. F. 84.6-P. 15.4 B 50% Car-miles	272,054,114	96,340,146
Greatest Variation	$74,981,384	$74,981,384

I have applied certain of these various methods to the accounts of a single railroad, to indicate the variation in application of the different methods. I have here the Atchison, Topeka & Santa Fe for
903 the month of January, 1910. I took the maintenance of way and structures expenses, and the methods I applied there were the post office department rule, the method used by Mr. Nay in the Advance Rate Cases, the method used by Mr. Drew, and the method used by Mr. Muller in the Pittsburgh Coal Rate Case; I have included, also, the old I. C. C. method used prior to 1894, and the method used by Mr. Peabody, who is statistician to the Atchison, Topeka & Santa Fe. The total of this block of expenses is $1,567,985.96. By the post office method, there is assigned to freight $1,032,079.55 and to passenger $535,906.41, being 65.82% to freight and 34.18% to passenger.

The application of the Nay method gives to freight service $831,659.77 and to passenger $736,326.19, being 53.04% to freight and 46.96% to passenger.

The Drew method results in the assignment of $921,034.97 to the freight service and $646,950.99 to the passenger service, being 58.74% to freight and 41.26% to passenger.

The Muller method results in the assignment of $1,102,930.25 to freight and $465,055.71 to passenger, being 70.34% to freight and 29.66% to passenger.

The old I. C. C. method results in the assignment of $847,924.60 to freight and $720,061.36 to passenger, being 54.07% to freight and 45.93% to passenger.

Mr. Peabody's method results in the assignment of $847,924.60 to freight and $720,061.36 to passenger, being 54.07% to freight and 45.93% to passenger.

904 The greatest variation is indicated by a comparison of the Muller and Nay methods. I have applied different methods to parts of the South Shore expenses, using operating expenses as reported to the Michigan Railroad Commission. I made use of nine different methods, taking accounts 4, Rails, 25, Locomotive Repairs, 9 Bridges, Trestles and Culverts, 24, Superintendence, Maintenance and Equipment, 55, Advertising, and 82, Fuel for Road Locomotives. I found that the highest and lowest differences resulted in these variations, expressed in percentages, for rails, 72%, locomotive repairs, 111%, bridges, trestles and culverts, 154%, superintendence, 143%, advertising, 26%, and for fuel for road locomotives, 4%. The percentage is the percentage of difference between the highest and the lowest, or the per cent which, multiplied into the lowest and added to it, would produce the highest amount.

The methods I used in arriving at those percentages are the post office method, the Drew method, the Frank Nay method, the Worthington method in the Wheeling & Lake Erie Coal Case, the Peabody method, the Chicago, St. Paul, Minneapolis rate case method, the Virginia coal case method, and the Muller method in the Pittsburgh case; and I also put into this computation the Woodlock method, which is a method of Mr. Woodlock, the writer for the Wall St. News.

The Muller produces the highest assignment to freight. Out of a total of $15,112, the assignments to passenger were: Post office and Woodlock, $6,875, Drew, Nay, Worthington and Peabody, $5,576, and Muller, $3,992; the sixth and seventh methods fall in between.

The conclusion I arrived at from the study of these methods is that they are reliable or not reliable, according to the judgment of the man that makes them. You do not get beyond, by the so-called statistical methods, the judgment of the man.

905 One expert may think it right to take in train weights in determining the wear upon rail, and another may not; their results are no more trustworthy for a rate case, or for any conclusion, than the judgment of the man who applies the rules. If two experts applied the same rule, in the same way, they would reach the same re-

sult, but their judgment comes in in determining what modification of these fundamental principles they make in the rule that they select.

So far as I know, judgments have not agreed on any particular factor. If they had, there wouldn't be this great variation in results. I think the method is pernicious; I wouldn't have anything to do with it, except to criticize it. There are so many arbitrary elements in the application of this rule that when one comes to a conclusion he hasn't anything he can rely upon. It seems to me to be an apparent demonstration by the use of figures which, when analyzed, is no demonstration at all, and simply a way by means of which men express their judgments. You might just as well take the judgments in the first place, without going through all of this analysis.

The Master: Isn't this a method of reaching their judgments?

A. I don't even regard it as that, because the questionable items in it are so numerous.

In using the word "pernicious," I used it in a sense that any illogical argument is pernicious leading to an untrustworthy result. My idea is that the results of the application of these methods of separation of common expenses, if untrustworthy, in my judgment, they cannot be separated with any degree of accuracy as to warrant their use in determining a rate case.

In condemning these assignments and these rules for assignments, I do not condemn them for the use of the railroad itself; I
906 condemn them as used by the courts in determining rate cases They may be very useful for the operating officer, for comparisons or for testing expenses, and I made that modification so that I wouldn't be understood as saying that these rules are absolutely useless for all purposes. They are approximately reliable for the use of operating officers, for the reason that in the case of comparative use of statistics you can have mistakes in your rules, but, if your mistake is uniform from year to year, the result may be of advantage to the operating officer in testing the relative economies of various divisions, or testing the operating results from year to year.

In a rate case, it seems to me you must have things that are accurate, but, for comparative use as statistics, it is not necessary to attain that degree of accuracy. I consider they are not available in rate cases, because they are not accurate, and because they require, in arriving at conclusions and applying rules, such an extensive use of arbitraries and judgments. I think any arbitrary; if it is an arbitrary of the nature of a judgment, ought to be excluded in what is called a computation and a demonstration.

ADAMS.

Cross-examination.

By Mr. Butler:

I am not now connected with the I. C. C. I am aware that it is now considering, with the Association of Railway Accountants, the establishing of rules for the division of costs between freight and

passenger. That matter is now receiving attention, in that the I. C. C. has made orders requiring information to enlighten it on that subject, to the extent, as I understand it, that it has requested from the carriers a statement for the separation, so far as the separation can be made, and the rules they would adopt where
907 they do make separation. They now have under active consideration the re-establishment of a direction for division of these costs between freight and passenger.

Certain circulars have been issued under the direction of Commissioner Meyer, and over his signature, asking for certain information. I know, also, that Commissioner Meyer is committed to this theory of specific cost for specific service. I do not know that any other Commissioner is committed to it. I know that it is the policy of the I. C. C. to let each Commissioner develop his department very much as he sees *hit*, and, in my judgment, it would be an erroneous conclusion to say that the I. C. C. has reversed or intends to reverse its policy with regard to the assignments of expenses between passenger and freight.

I- what I have said, I intended to distinguish between the official acts of Commissioner Meyer and the Commission itself. This matter would be a subject of statistics. The work of the Commission is done largely by divisions. In the ordinary and usual routine of business, for the preparation of such an order as required the separation of costs between freight and passenger, or details of the work, its supporting foundation, and all that, would be prepared in the division of which Commissioner Meyer is the head. If they approve the recommendation of the head of the division, an order on the subject would be made, if he recommended it.

I would not care to forecast the position of any other Commissioner on the subject. I do not intend to give the impression that this subject is not being considered in the ordinary and usual way that the making of orders on such subjects is considered. It is being considered. A great many things are considered that are
908 never consum-ated. The order in force for this division prior to 1893 or 1894 was in effect when I took my position, in 1888. The Commission was created in 1887, and before the end of the next year they adopted this rule, from the reports which had been made and were being made to the State Commissions, and which remained in force to 1894.

Q. That is to say, in the reports that the carriers were making to the State Commissions prior to 1888, as you understand the fact to be, the common expenses—the non-allocableexpenses—between the freight and passenger departments were customarily, and as a general rule, the country over, divided on the basis of revenue train miles, and that, when the I. C. C. came in, they found that established unit and adopted it, which you found when you came to the Commission?

A. Yes sir, in the first report of the I. C. C., it said that so far as reports were concerned it desired to begin with the reports that were being used.

I have not at any time, in connection with my official work, un-

dertaken to lay down any rule, or prescribe any method, for ascertaining the cost of doing freight or passenger business, or any part of either. I have made study of that question, with the view of ascertaining with approximate exactness the cost of doing freight or passenger business, or parts of either. I commenced that study in 1888; I studied it for four years, and agreed very heartily with the abandonment of the attempt to make that separation.

I agree, perfectly, with the recommendation of abandonment, and was a member of the committee that recommended it. So far as the resolution, part of which has been read into the record, is concerned, I concur in it, and I signed that report, and I suppose that is an assertion that the thing is useless. I believe that
909 all efforts to ascertain the cost of doing the freight of the passenger business on a railroad system is useless, for any public purpose, for any rate or tax question, except that it is useful for making operating comparisons. I don't think the thing is sufficiently accurate so that it can be relied upon for use beyond statistical and comparative purposes.

I think I am versed in, and an authority on, the subject of accounting, and especially as to railroad accounts. My testimony was confined to rate making; that was the purpose of submitting these variations and these inconsistencies.

Q. The idea was to show the ramifications or variations possible to support your conclusion that, here, now, if the ascertainment of cost is necessary we are up against the impossible thing, was it now?

A. Yes sir. And that is my belief.

Q. And you further believe, do you not, that it is beyond the possibility of scientific accounting, or accounting upon sound principles, to ascertain the cost of doing passenger business on the D. S. S. & A., either as a system, or in Michigan, or the intrastate or interstate passenger business in either Michigan or Wisconsin?

A. Yes sir.

Q. And you believe, do you not, that, as far as the art of accounting is concerned, it would be utterly impossible for public authority to prescribe, or railroad companies to invent, any scheme of keeping the books of the carriers to show the cost of doing the intrastate freight business on any road, in any part of the country?

A. I do not think it lies in the ability of accounts to accomplish that result.

Q. Or the total freight business of any road in any State?

910 A. I think so.

Q. Or the total freight business of any system of railroads?

A. Yes sir.

Q. And you would say the same as to passengers?

A. Yes sir.

Q. I want to make this thing complete; your idea is that the truth cannot even be approximated with reasonable nearness?

A. For a demonstration, yes sir.

Q. I mean for telling whether a rate is yielding anything above its cost—the cost of doing the service covered by it?

A. I think that lies beyond the ability of accounts.

Q. You think that lies beyond the ability of accounts to ascertain whether or not passenger rates on D. S. S. & A. in Michigan are sufficient to pay the expense of carrying that service?

A. I do. I think the methods of arriving at reasonable rates, resting on the specific cost of specific service, are methods which do not lead to trustworthy results.

Q. I am now trying to confine myself to the question of ascertaining the cost of a class of business; you think it couldn't be ascertained whether or not three-cent passenger fare in effect on the intrastate business in Michigan paid the cost of doing the business, do you not; you can't get even that close to it, can you?

A. It is, of course, possible to make your maximums and your minimums so ridiculously high and ridiculously low that you can be pretty sure you are in between, somewhere.

I do not think you can get near enough to state whether one cent a mile is too low, or three cents is enough. You can approximate anything, if you rely upon your arbitraries, but I don't think
911 you can approximate the cost with sufficient exactness. I would be willing to say that ten cents paid the cost, and that nothing didn't pay the cost. I think it could be approximated more nearly than that, but not near enough to satisfy the rules of specific cost for specific service. I think you have got to have it exact if you are going to demonstrate confiscation.

I have never worked out to see where I would let my judgment rest, but, if I must answer that, your Honor, I will say four cents up, nothing down. I got the minimum so low, as I wanted to be sure. I have never been a railroad operating man, and never occupied any position where I controlled railroad operating expenses, either passenger or freight. I never, in railroad employ, occupied any position where I was required to form a judgment as to the cost of business in the discharge of my duties.

Q. You do know, of course, certain truths that are generally recognized as about right, as, for example, that there are certain expenses that can be said, with truth, to be passenger expenses and certain other expenses that can be said, with truth and certainty, to be freight expenses; you recognize that as a truth of the railroad profession?

A. No sir.

Q. You don't believe that?

A. No sir.

Q. You don't believe that the coal that pulls the suburban train that we are looking out at, here, on this lake front in Chicago, from here up to Jackson Park, is an item of passenger expense?

A. I think it may be.

Q. Coal costs money, and you ascertain what it costs; so you do know that to run that train it costs so much for coal, don't you?

912 A. Yes, I know that it is possible to weigh out the coal to the passenger engines and to the freight engines, and that, if you are willing to rest satisfied with that as an allocation of expense to passenger service and freight service, you can do through accounts.

Q. Now, of course, your point is that the passenger conductor would, ordinarily, be considered a passenger expense, wouldn't he; also the engineer, fireman, crew, and ticket seller?

A. Yes.

Q. Now, of course, you can say that the coal in a freight engine, that is weighed out to the freight engine, and hauls the train down to Newberry, sidetracks there for a passenger train to go by, and something delays the passenger train up the road, it stays there, burning coal for two hours, you do know with perfect certainty that the coal that freight engine is burning on the sidetrack at Newberry is a passenger item, and not a freight item at all?

A. The recognition of that and a great many other interchangeable items is the reason why I say that even those so-called direct expenses are not always direct.

Q. That is the reason you say nothing can be allocated?

A. That is the reason I say practically nothing can be allocated. I think it would be justifiable, as an accountant, if the rest of the rule could be applied, to take the direct charges on the basis of vouchers; I would be willing to allow that.

Q. That is to say, you think that, where the allocations are made as a matter of current bookkeeping, and well done, they are sufficiently accurate for the purpose even of a rate case, as far as the allocations go?

A. Yes, I think it would — reasonable to accept that.

913 The rules I have referred to pertain to common expenses. It is admitted there are certain other charges which do not take into account the fine distinctions we have discussed. Practical railroad accountants consider that not more than 20% of accounts can be located from the vouchers between passenger and freight. To allocate 60% to 70%, they use arbitraries, and they are using arbitraries and assignments in what they call tried accounts; these arbitraries are not negligible.

In my judgment, not more than 20% of the operating expenses, on the average, could be allocated definitely and certainly, with sufficient approximation to use in a rate case, where you want to find the cost. That would be found in locomotive repairs and car repairs and coal. From the pay rolls, you can assign the wages, except where there is a single employee doing both freight and passenger business, and where there is an express agent and telegraph agent; there are a few of those accounts.

I am aware that accountants for the States in all these state cases, which have resisted railroad suits to declare rates confiscatory, have allocated or claimed to have allocated 60% to 70% of the total. 60% is a per cent that has come in very recent years; for years, the highest per cent claimed by those who discussed this question was 40%, and, if you analyze that 60%, you will find that there are a large number of arbitraries in it. Therefore, I am sure that whatever they call a direct cost covers things that are not direct costs.

I am aware that many railroads are still keeping separately, by systems and states, the freight and passenger cost, as a current matter, from day to day, on their books; they have to, to be prepared for

anything that comes; also, many use the figures for their
914 operating control. My impression is that a much smaller number of the railroads divide this by states than by operating sections; indeed, I don't know of any road now that currently keeps the divisions by states. I do not know of any that does not keep the division by states. Very frequently, the accounting division corresponds with the operating division of a railroad. I know what the general rules of carriers are as to dividing the common expenses between passenger and freight, as a matter of detail on their books. In the Atchison, for example, those are published; it comes out practically with the old I. C. C. rule, that modification being for the non-allocable items, and most extensive use of revenue train miles.

Q. This is what I am leading to: Isn't the fact that the revenue train mile, or substantially that basis, is in common and general use, and has been for a quarter of a century, by the railroads of this country for making that division for their own purposes on their own books, as a current matter?

A. Yes sir, I am inclined to think that is true, but that purpose is the operating purpose, and the purpose for executing their inter-divisional contracts, as, for example, on a locomotive pool or a car equipment pool, they make use of very many rules and arbitraries, which are mentioned in their contracts, so as to get the proper burden of expense to the various divisions of their property.

When they come into rate cases, they make variations of those rules, as has been shown by the rules that I have referred to this afternoon. I am under the impression that in the Oklahoma case the Rock Island modified its rule. I cannot specify any other instance, as I never looked that up.

The revenue engine mile and revenue train mile produce very close to the same percentage, but not the same. Used by itself, the
915 car mile basis for division of common expenses between passenger and freight I think absurd; used by itself, it is unsatisfactory.

Q. And direct charges, you think, is another humbug, don't you?

A. Along with the other humbugs, yes sir.

Q. Don't you want to kind of specially emphasize that direct charges business; isn't that in principle? Here are certain expenses of factory; some can be charged to one thing and some to another, and then there are common, and then isn't it the mightiest humbug on the face of the earth to divide the common on the relation of the allocated, as a principle for general application.

A. I am not acquainted with all the humbugs on earth; I think it is a humbug.

Q. Pure and simple, don't you?

A. I think it is an unfortunate rule.

Q. You don't think it is supported by any reason at all, do you?

A. I would say "no" to that, if my answer did not imply that I did support some other. I don't think the allocation by direct charges is a sound rule for allocation, primarily for two reasons, one being because there is a question as to what are direct charges, and the other being because you may assign an expense on the percentage

of another expense and there is no relation between those two expenses.

I took the total operating expenses for different items, to illustrate the large divergence-es that come from the application of those principles, and so as to make clear that the actual method used, which is made up by selecting from these principles, must rest upon
916 the judgment of the man. The showing would be more striking to take the totals, but the percentages would be the same.

The table on page 182 of my affidavit was designed to show, by primary accounts, the difference in the various methods. In making that table, I used, I think, nine methods, and on that one account six of the nine produced the same results. The percentages would not be the same throughout, because in other accounts they may have used other combinations. I selected the six accounts arbitrarily, and applied the different methods to each account. In account No. 4, Drew, Nay, Worthington and Peabody all followed the same method.

Q. Prof. Adams, in your affidavit filed in this case, I find the following language, and it begins on page 180:

"Q. What have you to say of the allocation of expenses as between Michigan and the other states through which the D. S. S. & A. R. R. operates?

A. This is a very large question. I was for three years a member of a committee representing the state railway commissioners and the railway accounting officers of the country, appointed for the purpose of devising rules for the assignment of operating revenues and operating expenses by State lines. So far as I remember, the only resolution which received unanimous approval was the resolution which in effect dissolved the committee. It is easy enough to get a rule which seems all right on the face of it so far as the localization of either revenues or expenses is concerned; but when one puts these rules together and applies them for the purpose of discovering the net operating revenues by states, the limitations of the rules which before had appeared so plausible, become evident. The unsatisfactory character of rules of this sort is that items respecting which some degree of judgment must be exercised are so numerous as to cast doubt upon any result which rests upon them. I might also say that from my study of this general question, I should hesitate to approve Mr. Delf's statement that ninety per cent. of operating expenses could be allocated directly as between the States. If this be correct it must be due to the unusually simple conditions under which the D. S. S. & A. R. R. operates.

Q. What have you to say of the separation of operating expenses between the passenger business and the freight business?

A. This is an old question. In 1893 the Interstate Commerce Commission abandoned the attempt to secure from carriers this class of information, on the ground that it could not be given with sufficient accuracy to serve any practical need in the testing of reason-
917 able rates. I have kept in touch with the various phases of this question since 1893 because of my interest in the rate cases that have been put up from time to time to courts and commissions, and that which impresses me the most in this matter is the

great variety of rules that have been named for the separation of passenger and freight expenses. These rules are not always consistent, either in the principles upon which they rely for the separation of common expenses, or in the relative emphasis which they place on the common principles recognized.

In order to indicate the wide range of results which follow the application of these various rules the following statement is submitted, designed to indicate the differences which show themselves in the application of various well recognized rules to certain of the primary accounts of the D. S. S. & A. R. R. To be exact I have tested this matter by applying nine rules which are advocated by different experts and which have been used in different cases, to the operating expenses as reported to the Michigan Railway Commission. The percentages in the statement indicate the difference between the highest and the lowest amount assigned to the passenger service of the total amount of expenses charged to the account named. As the purpose of this statement is to illustrate the point submitted above, I have not gone beyond the application of these rules to six primary accounts."

Then follows a tabulated statement, the caption of which is "Statement," and there is a column at the right, the caption of which is "Difference between lowest and highest assignments." The items in that statement are as follows:

Account 4, Rails	72%
Account 25, Locomotive Repairs	111%
Account 9, Bridges, Trestles and Culverts	154%
Account 24, Superintendence, Maintenance of Equipment	143%
Account 55, Advertising	26%
Account 82, Fuel for Road Locomotives	4%

"The possible range for estimates and arbitraries is too broad to warrant any considerable degree of confidence in the results arrived at."

Does the language in this affidavit to which I have just called your attention fairly state your present views upon the subjects?

A. Yes sir.

Q. Now, yesterday you gave me the impression that you thought that any attempt to divide operating expenses between freight
918 and passenger was utterly useless, or worse, in so far as the results would have any value for the purpose of making a rate or testing the validity of a rate in dipute?

A. Yes sir. That conclusion is grounded upon the reason that sufficiently accurate results cannot be obtained. I do not think cost of specific service should have anything to do with the specific rate covering that service, primarily because it is adopting a rule which is incapable of being worked out with satisfaction; also, the reason that transportation is a unit—a service rendered by a large number of agencies.

It is my view that the aggregate operating expenses ought to be taken into account in making a schedule of rates which will yield the aggregate revenue; this it is possible to secure from the records,

while it is not possible to obtain the specific cost for specific services, in my judgment. Even if the specific cost could be determined, I should be disinclined to accept the rule of specific cost for specific services, because it would seem to me to prevent the railways adjusting their rates so as to render the highest possible service to the public. It would harm the railroads by checking the development of the country, if they were now put into force.

My refusal to accept the rule of specific cost would apply to the intrastate business, taken as a whole, in any state, as compared with the interstate business, taken as a whole, in the same state. My judgment is that the cost of doing the entire intrastate business is not obtainable with reasonable accuracy for use in making intrastate rates. If it was, it should not be the test of reasonableness of either intrastate or interstate freight or passenger schedules taken as as a whole. If the rule is to ascertain the specific cost of the intrastate business as against the interstate business, each being taken as a whole, in any state, then it is my judgment that all
919 effort to ascertain such cost would be futile, as far as rate making is concerned. In my judgment, the application of the rule would be pernicious and harmful to the country and the railroads.

Q. Take the passenger business of any carrier, as a whole, as compared with its freight business, as a whole, I understand you are of the opinion that the cost of either cannot be ascertained with any reasonable degree of approximation, and that an attempt to do so would be futile?

A. That is my opinion, yes sir, futile for the purpose of rate making. The making of rates on that basis, even if the cost of freight and passenger could be ascertained, would be pernicious and injurious to the country, the carriers and the public, in my judgment. I think that under certain conditions it may be good business, reasonable and beneficial to both parties, for the rate making authority to be permitted to make the freight or passenger rate so low that some part of the expense of one would have to be borne by the other class of business.

Rates ought to be permitted so that the shipper of one class of freight—e. g., first class—should be required to pay some part of the expense of hauling a lower class, like grain of the farmers to market, if the rate making power believed it sound policy to do so. The question of whether it is permitted under decisions of the court calls for a legal opinion, which I am not competent to make. I think the rate making power ought to be permitted to so make the rates that the shippers of freight would have to pay a part of the expense of passenger transportation, if in the opinion of the rate making power it was sound public policy to do so.

I think transportation is a unit, and the application of ordinary business priciples to all of these traffic questions is desirable.
920 The unit would be described by the system undertaking the service, and the property used by that system would be the physical expression of that unit. I think the rate making power should be permitted to discriminate between different classes of passengers, and ought to be permitted to require railway companies to

carry passengers free if, in the view of that power, it would be wise from the standpoint of all concerned and the public and the carriers to do so. The difficulties arising out of our forms of government must be overcome before you can have a properly organized body for the supervision of railway transportation.

I think any charge which under strict and proper accounting goes to the capital account of a railway or a public service industry is a charge to be included in the sum upon which the public service industry is permitted to secure, or ought to be permitted to secure, a reasonable return.

The prices paid by the operating company is not in all cases, in my opinion, a satisfactory test, though it is where there are conditions of free sale, and no comity of interest between the parties—what we ordinarily recognize as a free market. The price paid for a property 50 years ago would be the test now, provided the proper debit and credit charges to the capital account had been maintained to the proper account during those 50 years. It should be taken, provided it is taken in connection with all the accounting entries that properly record the transactions of the company during the 50 years. They would affect what I call the proper charges to the capital account, which is, as I have stated, the figure that should be taken to measure rates.

My views, as to the rule of a specific cost for specific services, are not affected by my views respecting a proper procedure for making rates.

921 Take a purchase of real estate 50 years ago, at $5,000, and assuming the same real estate now used for the same purpose as it was used for 50 years ago, I think the $5,000 is the sum that ought to be included in what is called the value for determining the rate. I do not mean, by value in its use there, what is called the fair present value as that term has been used by the Supreme Court of the United States in rate cases. I understand my answer is not in harmony with some of the views of the court.

The value for ad valorem taxation may be higher or lower than the value for rate making purposes, or it may be the same. The comparison would not tend to shed any light on the propriety of the tax or of the rate valuation.

For the purpose of what I have said, all of the material entering into the construction of a railroad is unlimited. The commercial value of a railroad is the value which arises upon its earning capacity, arrived at from the books. If you are given a true net revenue, then you would get at the commercial value by capitalization. You take the net revenue, assume a reasonable percentage of return, capitalize that revenue to arrive at a capital fund which would produce that return, and that would be the commercial value of the property.

I have no personal judgment as to what is a reasonable rate of return, but I have always substituted for my judgment the judgment of the market, and that, after allowances for uncertainty of revenue, would seem to me to be five or six per cent.

The commercial value might be greater or less than the physical value, arrived at by the reproduction method. My answer is that

neither the commercial value nor the physical value as deter-
922 mined by inventory should be accepted as the basis for mak-
in a rate; I make this to preclude my assent to the proposition that the physical valuation being made by engineers represents the value upon which return should be made. The commercial value should not be used as the basis for computing the return, or determining the reasonableness of a rate, as it is at issue in the case. It depends upon the rate; as you make the rate, you increase or decrease the commercial value. Therefore, you cannot take the issue in the case as the basis for computation.

In my opinion, the engineers have not, by the methods they have adopted thus far, so far as I am acquainted with them, arrived at the correct conclusions for the testing of rate cases. In my judgment, the engineering profession has been in error in the inclusion, in arriving at real estate values, of all their multipliers; also, the application of percentages for contingencies seems to me to have been over-emphasized.

In my direct testimony, I did not intend to suggest any method to be used for the separation of operating expenses on South Shore between passenger and freight. I intended to criticize, as useless, the method which had been employed, or any other ever employed or that could be devised.

The portion of my affidavit read this morning was for the purpose of sharply illustrating the different results that could be obtained by different methods, and for the purpose of establishing my claim that they are all wrong. I am not conscious of having selected the instances calculated to bring out in a glaring way the different results that could be reached by the different methods. I have never prepared anything that would do it in a more glaring way. I have never seen it illustrated more glaringly, though I think what was referred to as prepared by Mr. Muller would produce the same result more convincingly, because it covers larger figures.

923 I did not know that at the time I made the affidavit, but learned it since, and brought it in to more convincingly present the facts. I selected accounts 4, Rails, 25, Locomotive Repairs, 9, Bridges, Trestles and Culverts, 24, Superintendence of Maintenance of Equipment, 55, Advertising, and 82, Fuel for Road Locomotives, and applied to each item nine different methods. I distinguish between car mileage as a factor and the rule that makes use of car mileage as a factor.

On the item of rails, $15,112 was the system expenditure for 1910. The factor used by the post office department for rails was revenue train mileage; Drew's was revenue service locomotive mileage. I cannot give the miles used in making the calculation according to the Drew method. I think those came from the annual report to the I. C. C. or State Commission, and that is true of the revenue train mileage, that the post office department uses.

Nay used the revenue train mileage for rails. The Worthington method was one-half on train mile basis and one-half on car mile basis. Peabody uses the revenue train mileage, the same as the post office department. The Chicago, St. Paul and Minneapolis

case method was 90% on weight and 10% on earnings; that was worked out by J. T. Muller. The Virginia Coal method was 90% train weights and 10% earnings. I have not the definite figures for that account for those two methods.

The Virginia Coal case was the Hillman Virginia method. The various Hillman methods were taken from a brief of D. A. Worthington, receiver of the Wheeling & Lake Erie. The Ohio Lake Cargo method was 50% car mileage and 50% train revenue for account 4, Rails. Hillman's Florida method is all train weights; his South Dakota method is 90% train weights and 10% gross earnings on traffic, excluding switching, mail, etc. The Hillman,
924 Minnesota, Alabama, Hocking Valley and Norfolk & Western formulas were 90% train weights and 10% earnings (gross or net). The Hillman I. C. C. formula is 90% freight revenue and 10% passenger revenue.

I approve of none of these for dividing the rails. I consider all the Hillman methods just referred to as valueless for the purpose of dividing the cost of renewal of rails between freight and passenger departments.

That whole theory of assignments has had a historic development; it was used in Germany, where they used wheelage and where their cars were small, and they had some cars with four wheels, others with eight wheels, and then they began to use big cars, with more wheels, so they used wheelage as the basis, and others used axles as the basis. At one time in this country, when Mr. Albert Fink was chairman of the trunk line, he endeavored to have the railroads of this country adopt an axle basis. They did, however, continue their train mileage, on the theory that the wear of the rail was in proportion to the impact of the train, and that the heavier freight train was more than counterbalanced by the impact due to the speed of the passenger train. There was possibly some justification for that at the time that it was used. Then came the development of fast freights, of heavier freights, and the development, also, of the very heavy passenger trains, and it seemed to those who were dealing with this that the change in the method of traffic vitiated somewhat, or impaired somewhat, the application of this rule.

The old Interstate Commerce rule, and these various rules that have sprung up since that time and since the recent revival of this attempt to separate costs, I think, is responsible for all of these variations. Showing that the conditions of traffic are very much more complex than they used to be, and that the manifest errors, arising from those simple rules, have led the experts to endeavor to
925 make allowance for specific conditions. I can illustrate that best, I think, by Mr. Muller's statement with regard to ties. In that case, he puts 17.5% assigned to wear allocated on the basis of train weight, and 82.5% assigned to weather allocated on the basis of earnings; that is, the ties, as I understand his reason, are subject to two causes of deterioration, one being the wear and the other the weather, and he assigns 17.5% to wear and 82.5% to weather. That I understand to be the way they get at these minor distinctions and modifications of the rules.

The Woodlock method is set forth in his book, "Anatomy of the Railway Accounts." I don't remember whether he used train miles. I think his result on rails was the same as the post office method—$6,875 passenger; I don't know whether he used the same factors as that method. Muller, in Pittsburgh Coal Rate Case, divided rails one-half on locomotive miles, including switching, and half on car miles.

I have no opinion as to which of the nine methods most nearly approximates the truth. I have never formed an opinion as to the proper method of dividing rails, or any other item in the schedule, between passenger and freight. I have never been able to devise a proper or satisfactory method for any account. If they are all pernicious, I don't see how some of them could be better than others. I have testified that I think the system is wrong, or, at least, the conclusions erroneous, and I should not care to testify that some of them are absurd, as that calls upon my distinguishing between the methods.

The post office method has not been promulgated in the sense that it has been sanctioned by Congress. They have not used the method, except in the report of the Postmaster General to Congress, and it has been made the subject of considerable study by all
926 the railroads of the United States. It has never been applied to any practical question for the purpose of getting at results, and I understand that it is at present before Congress. By the use of that method, I assigned the highest amount to passenger—$6,875. The post office method varies very little from the method used in the Buhl Case by Commissioner Meyer. The Muller method gives the lowest to passenger—$3,992.

The post office and Woodlock methods assign 45% to passenger and 55% to freight, while the Muller method assigns 26% to passenger and 74% to freight. The difference between these two methods would be 19%, but I do not express it in that way. The percentages assigned to passenger by the different methods are: Post office and Woodlock, 45%, Drew, Nay, Worthington and Peabody, each 36%, and Muller, 26%. I have expressed the variation by a percentage of 72, and I expressed that difference in the words, "Difference between the highest and lowest assignments in percentage." The percentage of 72 was obtained by substracting the lowest assignment, $3,992, from the highest, $6,875, leaving $2,888, divided by $3,992 equals 72%; that is the difference between the highest and lowest in percentage, and the caption is accurate and truthful.

The 72% is the relation of the difference to the lowest, and the same result is varied if you take 45% minus 26% equals 19%, divided by 26% equals 72%. If you had divided the $2,888 by the highest, $6,875, the result would have been about 42%, but that is not the way that you find what the percentage of difference is. The 72% shows the variation in the result of the application of these rules. It shows that you must add to the lowest amount 72% of itself, in order to produce the highest, and therefore the difference between them is 72%.

927 I think I have saved the figures working out these accounts for the nine methods, but I don't know. It is true, so far as the affidavit is concerned, that it is impossible to check the correctness of my calculations resulting in these percentages without those figures.

My memory is that all these methods were taken from the statements of the men by whose names they are identified—taken from their testimony in cases, as reported. I will identify these methods, and give the sources from which the data was taken, and sources of details of the Nay, Worthington, Peabody, Chicago, St. Paul & Minneapolis, Hillman, Woodlock and Muller methods.

I can furnish at a subsequent time the working figures by which I obtained the percentages in the column of difference between the lowest and highest assignments, which are in my affidavit, and also a statement of the nine methods.

The method of giving the lowest amount for item 25, Steam Locomotives—Repairs, to passenger is the post office method; that method gave the highest amount to passenger in the division of rails, and the Muller method gave the highest for locomotive repairs and the lowest for rails, thus trading places. That is typical of the use of these figures by the various experts.

I would have to get the data from the books of the company to apply the Drew method for account 82, Fuel for Road Locomotives. I did not go to plaintiff's books to find out those factors. The percentages in this statement and my affidavit may have been arrived at by taking the South Shore figures; they were percentages that I find in the work of others. Of course, to be exact in amounts, that would have been incorrect. Mr. Muller worked on a coal carrying road, and his passenger assignments seem to be a small percentage of the total. In some instances, he was the low man, so far as
928 the passenger assignments on these six items of the South Shore primary account was concerned. Not having the South Shore data, I took the percentage which he ascertained in some other case.

It is readily conceded that, if the amounts were significant, that would not have been the proper method of procedure. Inasmuch, however, as I was merely illustrating a general situation, and by differences, it occurred to me that the exact amounts were not necessary for the conclusion we aimed to arrive at.

Q. But the same method for dividing the principal items in the maintenance account—take revenue train miles for example; applied in precisely the same manner, it would give widely different percentages on different roads, the traffic being different in its relation of the freight to the passenger; isn't that true?

A. That is certainly true.

Q. So that, for example, if you took the revenue train mileage basis for the purpose of apportioning the maintenance of way and structures common accounts between freight and passenger, on the Burlington road, in the vicinity of the coal mines in southern Illinois, where, over that particular division, we will say, there is ten times as many freight train miles performed as there are passenger

train miles, you would get a very low passenger allowance,—a ten per cent allowance on that figure,—wouldn't you?

A. It would be quite possible.

Q. But if you applied the very same rule to the very same problem on the New Haven road, or on another part of the Burlington, as, for example, between Chicago and Aurora, in Illinois, where there is, say, for the purposes of my point, ten times as many pas-
929 senger train miles performed as there are freight train miles, then you would get 90% of these items so divided to passenger, as against the 10% that you would get down on the coal mine divisions, in southern Illinois; that is true, is it not?

A. All of those results follow from those assumptions.

Q. Now as a matter of scientific investigation, in searching after the truth, would you not say that the application of the percentages ascertained by Muller's scheme, on a coal carrying road in West Virginia, would be unfair if applied on the South Shore in Michigan, if the relation of the passenger train traffic to the freight train traffic is different to that on the road in Virginia, where Muller worked?

A. All of which I was endeavoring to illustrate by what I put in my affidavit.

Q. Now, did you put anything in your affidavit to indicate that, in arriving at these percentages, you took percentages ascertained by investigators on other railroads, where conditions were probably different?

A. There is nothing there to indicate the percentages or the rules that were used, and all that you are saying seems to me to lie right alongside—reinforce—my point.

Q. That is, you say that if on one railroad in a given set of traffic conditions a method of dividing these common operating costs in the maintenance account produces a low per cent and on another road, where there are the reverse conditions, it produces a high per cent to freight or passenger, that tends to discredit the method?

A. Yes sir, it shows that the conditions are so various that you must have a method for every set of conditions, and that that opens
930 the way for arbitrary determination in particular cases, so that it is unsafe, as a general rule, to be followed in rate cases.

I said it was possible, in case of direct charges, that, in reaching affidavit percentages, we used the percentages ascertained by the application of the method to conditions of other roads, but I never conceded that we took the percentage of locomotive mileage in a coal road and applied it to a passenger road. In the affidavit computation, I made no use of train weights. I applied the methods, but, where we didn't have the data for a particular account, that was left unfilled. I desire to check the figures given as details of percentages of the affidavit, and see if they are correct.

If on seven of the nine methods the results were alike and one different, I think the argument in the affidavit table would be weakened, but that is not the fact. On account 4, which is but one of 115 accounts, four of the methods agreed at 36% to passenger,

two at 45%, and one at 26%. These facts are important in a search for the truth. I do not know why all the figures for each of the six accounts were not put in. I do not know why I took these six accounts, rather than others. My memory is that I took them as they came, picked them up here and there, because each one involved a different set of considerations; but it is merely illustrative of the variation. It would have been much better, doubtless, if the entire 115 had been spread on the record.

I do not know whether other items would show greater variation; I am sure, from general study, that others would show just as great variation. With regard to South Shore, I never made that test, but I know that is typical of a general variation in the various accounts.

It is very much greater than the average of the total, because
931 one set of figures would be higher and another lower, and in the total it is possible that they many to some extent counteract each other; but the purpose of the argument is to show the uncertainty of these arbitraries.

I selected the six items at random. The items selected are those which cover a common freight and passenger use. The wage items were not selected, as they are more largely subject to direct charges. I selected what seemed to me to illustrate the point that there were great variations in the different methods and that the divisions were open to question because of such enormous variations. The inclusion of account 82, showing a variation of 4%, shows that I did not select to show the most glaring instances possible.

My examination was made for the purpose of most strongly, by illustrating variations, supporting my long entertained contention that an attempt to make these divisions is futile, and worse than useless. The argument was presented in the strongest manner I could think of at the time.

Q. The direct charges method is that, in the case where you have charged some items directly to each of these departments and there are some items yet to be divided, you ascertain the relation of the passenger direct charges to the total direct charges and assign to the passenger such proportion of the items to be divided as the direct passenger charges is to the total direct charges; is that it?

A. That is correct.

Q. Can it ever be applied to any item so as to show the truth or the approximate truth, in your opinion?

A. In my opinion, it is very questionable, for the reason that it may lead to the division of the expenses of one class according to prinliples that dontrol the entirely different classes of expenses.

932 Q. By unrelated things?

A. Yes, you may use as the basis a ratio derived from a set of expenses that have nothing to do with the expenses you are assigning.

Q. Suppose you were dividing the cost of lubricants on a locomotive, and you had directly charged out the fuel and water, but hadn't kept account of the oil directly as furnished to each class of locomo-

tives; then the direct charges basis would have some relation to the problem?

A. It might have some relation to the problem, provided you knew from the record the relation of oil total to the total of coal.

Q. That would be a simple matter of keeping the record?

A. In that case, it might not be questionable.

Q. So, when you are considering these factors, it is well to consider the whole problem, and not pick out any one particular thing, and show that it is absurd as to that, and jump to the conclusion that it must therefore be absurd as to the rest, isn't it?

A. That is correct.

I shouldn't undertake to say that these rules that we have been considering, known as the Nay rule, the Drew rule, and others, are not more accurate in their results than just the bare application of the general principles.

I think, if the problem is that of the operating officers, that the locomotive mile can properly be used for some divisions of common expenses. No matter what the problem is, where you are trying to divide, between the two departments, certain items of cost, it can be used. I think the revenue train mile can also be used, if you
933 are bent on doing it. I cannot think of anything better for the division of the cost of maintaining fences along the road. I would not say it would produce right results.

The chief purpose of a right of way fence is to protect the train from trespassers, and to protect trespassers, whether live stock or persons and to distinguish railroad property from the other. If you are trying to get at the cost, I would say apportioning half the cost of repairing the fence to freight and half to passenger, where the number of trains is equal, would not be a proper basis. In a rate case, if you are endeavoring to base your argument for a reasonable rate on cost, that division would not be sufficiently accurate.

I can conveive of very many things that could damage that fence and call for repairs which might be wholly imputable to one service and not to the other; therefore, an assignment in proportion to train mileage would not give the proper results. Even if all the repairs were due to weather, I don't think a division on the train mileage basis reflects the exact truth. I do not see that weight and speed have anything to do with the wear of fences. I don't think there is any definite relation between the weather wear of the fence that causes a fence repair and the cost of running a freight train or a passenger train.

The cost of repairing an exclusive passenger platform would come under the head of direct charges; that would be accurate enough for rate purposes. In saying that that is sufficiently accurate for rate purposes, I mean the methods by which the figures are arrived at do not depend upon the exercise of arbitrary judgment on the part of the accountant.

934 The rate problem is insoluble along the lines of the analysis of cost. Whether the judgment of men familiar with conditions affecting the relative cost of freight or passenger business is a safe criterion depends upon what the judgment is for. The

practical man is obliged to go through this same line of analysis that the experts go through with, and, if they are not tenable for the experts, they cannot be tenable for him. I don't object to the exercise of personal judgment for certain purposes, but what I object to is the adoption of a rule which requires such an extensive use of arbitraries and personal judgment, which assumes that it is a demonstration, and accurate.

Even if you had the passenger expenses in Michigan correctly, it is not my opinion that the division of that between intrastate and interstate passenger in Michigan can be fairly and reasonably approximated. I think that division cannot be made with sufficient accuracy to justify the formation of an opinion as to the reasonableness of the interstate or intrastate rate; but you can proceed upon an entirely different analysis for a conclusion respecting the relative cost of the interstate and the intrastate. I don't think you can determine the relative cost of the two with any mathematical accuracy, but you can set boundaries beyond which it is not reasonable to say that it goes in either direction.

What I said in my affidavit was that 25% excess cost for intrastate business is too high; the 10% or 12% would be somewhere near right; it may be 5% or 6%, and it may be nothing. Confining yourself to that particular question, you can set a maximum and a minimum with, perhaps, a reasonable degree of certainty. That may also be so in the division of freight cost between intrastate and interstate, if the operating conditions are such that indicate
935 that there is a difference in cost. That is a matter of judgment of men familiar with it, who can get reasonably close to it. I have not set any figures; I simply put a maximum one way and the other, and I say that it seems to me, knowing what the courts have said in other cases, that the 25% is too high.

I have not consented to the proposition that, if we have the right amount of passenger expenses in Michigan on the South Shore, the relation of the cost of intrastate to interstate can be gotten at as a matter of judgment with reasonably close approximation.

Q. What I said was that you can get a maximum up beyond which you are very sure it does not go, and a minimum below which it won't go, and this maxima and minima, as you intended to express it in this affidavit, 25% was probably too high and 10% or 12% about right?

A. Yes, and there are 10 or 12 ratios between that you can have; your question implies that you can get at a ratio.

Q. You can get that close to it, anyway—from 15% to 25%?

A. Yes, where you have a range of 30% or 40%, I guess you can.

Q. You didn't have a range of 30% or 40% when you said 25% was high and 10% or 12% was about right, or something like that?

A. 25% high and 12% low; the difference is 108%.

You might estimate the freight within 30% or 40%, if you had the total freight expenses in Michigan. I don't know as you could get it as close in the freight as you can in the passenger.

Q. That there may be no misunderstanding, I want you to cal-

culate on the record that 30% or 40% spread that you say you had in the passenger business when you made your statement, in your affidavit, that I have read. I want you to work out that 30%
936 or 40%.

Tell us how to do it, and we will do it; tell us on the record.

A. 25% is your maximum and 12% is your minimum; the difference is 13%, and the variation of the per cent is that per cent which multiplied into 12 will give you 25, which is over 100%; so I withdraw 30% or 40%, and substitute 100%. The range of difference is 108-1/3%. That is the customary way of expressing ranges of per cent, when you wish to find out how much you must add to the lower figure in order to get the higher.

If you wish to proceed on the discount side, you would divide the 13 by 25, but I do not understand that is the way to express ranges of percentage. To subtract the 12 from the 25 and say the difference was 13 would indicate the difference in quantity; that is not a difference in relation.

By Mr. Wykes:

In my criticism of plaintiff's figures, I do not think I have gone further than to show the uncertainty of the method followed by plaintiff in the presentation of this case. It has been my understanding that in rate cases it is the duty of the railroad company, in attacking a rate, to show the confiscation to be palpably and certainly the result of the rates, before they have made out a case. In a case involving confiscation, the method ought to be definite in all its items.

I did not engage in constructive work, in assigning costs between passenger and freight, because I do not believe in that, and do not think results which are reliable can be attained in the assignment of common costs of railway operating. I have, in connection with this case, declined to consider constructive work in the assignment of costs.

I was asked to do so, and I refused.

937 Q. In your criticism of so many arbitraries which rest in your judgment, is that criticism to any extent due to the fact that these arbitraries are dependent upon and have been reflected in different judgment, very widely varying, with no seeming common consensus of opinion upon them?

A. I have been impressed strongly that that was the fact in studying these varying methods.

The percentages expressed in my affidavit show the differences between the highest and lowest assignments that would result from the seven or nine methods which I applied on certain primary accounts. I don't know that the table in the affidavit presents the question more strongly than the figures would if applied to certain other items of the primary accounts. I have never attempted to prove that out, and didn't work out a number of items and then take the highest.

The fact that by different methods applied to a certain account the

same results are produced for a single item is no indication whatever that the results as applied to another of the 115 primary accounts would be the same, because of the fact that these methods may have been quite alike on account 4 and different on other accounts; there may be a variation, and that variation may be up or down.

For a particular item, one man's method would produce a high figure in one account and another's a low figure, and on another account those same methods would perhaps produce the reverse.

It seems very easy to devise rules to localize the expenses by states, and that has been done, and tentative rules for that have been published, but, when you add to that a separation of revenues by
938 states, so as to give to each state its proper proportion of net revenue from operations, it is found to be a very difficult question, largely because certain states have the terminals and other states don't have the terminals; the difficulty arises on account of the proper allocations of the terminal revenue and expense. It is the same class of questions that comes up in the allocation of expenses or revenues between branch lines and main lines, between feeders and trunk lines.

It is not necessary to arrive at the physical value in order to determine the commercial value. You can reach the commercial value by a capitalization of the net earnings at a proper rate. Definite and formal interest by the I. C. C. in the re-establishment of a rule of assignment of costs has been shown since Mr. Meyer of Wisconsin became a commissioner, about three year ago. The formal action on this point has been taken since he became statistician, after I severed my connection with the Commission, in June, 1911.

ADAMS.

Recross-examination.

By Mr. Butler:

It is my understanding of the rule in confiscation cases that the proof and methods of proof, as respects the ascertainment of costs, must be definite and accurate. My position is that there are no definite or accurate methods of ascertaining the cost of doing business covered by the rates complained of.

I do not think it is necessary to determine the cost of doing the passenger business on any road in order to determine confiscation. I think the total cost of all business, state and interstate, would have
939 to be determined. I am familiar with the decision of the Supreme Court to the contrary, and think that will have to be modified before we get any satisfactory adjustment of this problem.

I think a railroad properly administered might evade the necessity of having a rate case tried on the confiscation basis; it might do that by turning from the expense side of its accounts and statistics to the revenue side and service side and traffic side of accounts and statistics. That question opens up a whole question of public policy, and then asks whether the railroads are willing to take their side of

that work, and whether they will or will not, if they take that side of a public policy work and recognize frankly and freely that they are public agencies, be met by the public so that there can be some harmony of action.

I said several times that I do not think this method can arrive at sufficient certainty so that you can demonstrate confiscation or the absence of confiscation. I don't think any method that applies the rule of specific cost to specific service can do it.

Q. Can any method do it, at all? Is there any way to do it, and, if so, how, in your opinion?

A. I can possibly answer that to the extent that the question of confiscation is decided, or ought to be decided, when the total expenses are measured against the total revenue, and the relation of the total net revenues considered, and that net revenue considered in its relation to the value of the property. Now, if it is shown that there is no confiscation, then the question of the distribution of the burden that the public contributes—passenger and freight rates—to the company is a question of public policy, and not a question of private corporate management.

940 I do not distinguish between states or between intrastate and interstate revenue in my answer. I do not think there is any way to ascertain that with sufficient certainty or definiteness to meet the requirements of a confiscation case on intrastate net earnings, both freight and passenger, taken together, in any state, nor to meet the requirements of making a reasonable rate.

I think the ascertainment of the net earnings by totals for states is the easiest of all the questions of separation, and, if that were the only point to be considered, it is possible that one's judgment might approve a rule for the separation of expenses and revenues by state lines. My answer, in answering your theoretical question as to confiscation, was confined to the total revenues of the railroad as a unit, because, in that case, no question can arise as to what is the expense or what is the revenue. My idea is that they could make them haul certain classes of business for nothing, as long as the total on the system was sufficient, if there was a reason for justifying this, and that, also, discriminations between classes of traffic might be made, so long as the total revenue was all right and the discrimination reasonable in the judgment of the rate making body.

I declined to serve the State in the capacity of an expert employed to determine whether or not the intrastate rate was confiscatory. I accepted employment on criticizing the methods that were, or might be, adopted, for the purpose of showing that the case is not made out. My assistants, of whom there were six, reported to me that they were treated very courteously, in being given access to company records. I have no complaint that every facility was not offered us to ascertain the exact, specific, concrete facts in the case, the manner of keeping records, etc. I have given in testimony all that I desire in the way of criticism, and my criticism is not directed to the account-

941 ant of the South Shore, but to the general principle.

I think all the methods for the separation of costs are bad, and I should dislike to say that one is better than the others. From

the first, I declined to take up the question of whether the rates were confiscatory, and decided to confine myself entirely to the criticism made. The work done by Messrs. Friday, Heiss and others was not all done in aid of criticism. There were questions with regard to the localization of revenues and with regard to methods of apportionment, and to many other questions which were taken up. There was nothing constructive in my work, so far as determining whether that particular rate was or was not confiscatory, except so far as contained in this first affidavit. All of the work done under my direction was for the purpose of testing the work.

With regard to the item of wages of switch engineer and fireman, if observation shows they spent nine times as much time in the freight as in the passenger business, and the item divided 10% and 90%, that would be an arbitrary allocation upon the basis of time, the arbitrary being the assumption that the time reported is the time in one service and not in the other. I would be willing to call the wages of the engineer a direct expense, if it is on the basis of time. I would be willing to go that far; that is an arbitrary, upon the basis of time, which you could approve. The whole question of its propriety depends on the facts on which they rest. If the facts justify it, it is a good method. Whatever the facts justify is doubtless a good method; there is no denying that.

Walter J. Myers is the statistician of the L. C. C. and under the immediate direction of Commissioner Meyer, who initiated the move-
ment to make the division of operating expenses between pas-
942 senger and freight which commenced soon after he became a member of the Commission. Mr. Walter J. Meyers is obeying orders, in trying to find a basis for that division to recommend to Commissioner Meyer, so Meyer may recommend it to the Commission, so the Commission may make an order, if it sees fit. I believe it to be contrary to the fact that Walter J. Meyer believes in the assignment. I think he is obeying orders, but I think he has little confidence in the assignment of expenses between the passenger service and the freight service.

I have spent no time investigating the subject with a view to opposing the order; I have done nothing in connection therewith, and am not concerned in it in any way. I have had nothing to do with the I. C. C. since severing my connection with it, except to appear as a witness before the Commerce Court. I have nothing either for or against the policy advocated by Commissioner Meyer that in any way is addressed to the work that the Commission is now doing. I have considered the subject with other people, but it had nothing to do with the work that the Commission is undertaking.

My consideration was an investigation to make as clear a statement as I could showing why I believed the problem could not be solved. My work has absolutely nothing to do with what the I. C. C. is doing. I have done much work on the subject, and have been devoting a great deal of time to it. But that had nothing to do with the I. C. C., or the fact that the I. C. C. is investigating this subject; that is not the motive of my work. The question was not purely academic as far as

I am concerned, but I was employed to do it, though I would prefer not to state personal relations.

943 ADAMS.

Redirect examination.

By Mr. Wykes:

It is conceivable that a case of confiscation might be so extreme that you could leave out the part of the expenses that must be arbitrarily assigned and reach a conclusion that the rate was confiscatory. This might be so upon 20% of the expenses which admittedly can be assigned, or upon the 50% or thereabouts which it is claimed can be assigned.

ADAMS.

Redirect examination.

By Mr. Butler:

The case might be so extreme that a passenger rate might be shown to be confiscatory without any figures at all, but whether that is 2.5¢ or 3¢ a mile you cannot tell.

As to whether railroad men familiar with particular roads where conditions are similar might tell with accuracy whether there were any net earnings in that class of business, I think they can with sufficient accuracy to determine whether or not they wanted to go on with the business as a business proposition, but, when you come to apply that to a rate case and say whether or not to change the rate will be confiscation of property, I ask myself at once what property is used; you bring in all of those nine or ten sets of arbitraries; we have discussed here only one set of arbitraries.

An experienced railroad man, long in charge of property where operating conditions are similar, can form a judgment of much value in the operation of the property upon whether there is any profit in the passenger business, and reasonably accurate for the purpose of administering the property. Upon the question of whether there is a net return in passenger or freight depart-

944 ments above operating expenses, his judgment would be much better than that of an outsider. Of course, experience must necessarily help a man's judgment. I would prefer to trust his judgment to the judgment resulting from such a computation as implied by the application of this rule of specific cost to specific services.

Q. And you realize, do you not, that an expert employed to examine railroad accounts on a road with which he is not familiar, and has only the data recorded which is required to be recorded by the I. C. C. classification of accounts, other things being equal, is not in nearly so good a position to pass on these questions as the man who is in the accounting department of the road, keeping track of those things

from day to day and week to week, and year to year, and measurably controlling the expenses?

A. I think so, provided the man who is in that position would use his judgment as an operating or accounting man, and not apply to his figures some rule that has been worked out in some other case.

The matter of experting has, I think, resulted in these things and methods and arbitraries I have condemned as useless. I think they have been imposed upon the carriers, and especially the accounting officers, by the courts, and the accounting officers know that they are useless; I think the accounting officers of this country, if you will take a vote, would vote against them; that is my judgment.

Q. You think the accounting officers all know that these methods employed by these experts, is simply quackery, don't you?

A. Yes, and their own records, where they, themselves, are called upon to defend their own company in rate cases, they do this because they are requested to do it, and the request seems to come to them, or does come to them, from the decisions of the courts as
945 to what the courts want to decide the questions upon.

The revenue train mileage basis is used by many accountants to divide the principal common expenses in maintenance of way and structures between passenger and freight, and it is modified by a great many of them. A great many railroads use the direct account basis. Mr. Nay makes use of some of it; I cannot answer that he uses it in his office accounts. That, of course, is explainable in this way: There are two uses for this assignment—operating use, and a use in rate cases. I think it is perfectly proper for methods to be used which in and of themselves are not absolutely accurate if you wish to use them for comparative purposes.

My study leads me to say that, while the revenue train mileage is in very common use for the division of the principal items of maintenance of way and structures, it is frequently modified. The modifications I refer to were those used in rate cases, and not the rules they used for their own offices.

I cannot mention a company that uses any other than the revenue train mileage or its equivalent as a matter of routine on its books for separation of freight and passenger common expenses alter allowing such as they think can be allocated with accuracy, but the fact that I cannot mention it ought not to be accepted as a denial of the fact. I do not know the opposite of it, either. I have not studied this question from the point of view of the regular routine work of accountants in this country. They do not make those divisions between freight and passenger on their books. They make them in their office, and I have not studied the matter from that point of view. The consensus of opinion of all railroad accountants in this country would be valuable o nany subject of that kind.
946 I insist on making the distinction that these methods used by the accountants of railroads, and maintained for so many years, are for the purpose of operating officers, and for uses of comparison, and your questions are misleading when you ask me about the consensus of opinion. The consensus of opinion, when the purpose is one thing, ought to be confined to that purpose, and I do not

know, and I do not believe,—indeed, I believe the contrary to true,—that, if you get the consensus of opinion of the auditors of the railroads of the United States, it would be that this rule of specific cost for specific service, as applied to a rate case, is pernicious.

The propriety of dividing these expenses, or of any method, depends upon the purpose of the division. I should approve the use of certain rules, if confined to what operating officers need for statistical and divisional comparisons, but I disapprove, and I believe,—and, from what I know, it is my judgment,—that the accounting officers of railways in this country would agree with me. I disapprove the application of these rules in rate cases. I have talked with the railroad accounting officers on that subject for years.

ADAMS.

Redirect examination.

By Mr. Wykes:

(It is stipulated that the free right of way of plaintiff and its predecessors from the State and Federal Government equalled 130 miles—defendants claimed 147.60 miles, and plaintiff 112.32 miles. Of this, approximately 20 miles came to D. S. S. & A. from the Federal Government, under map of definite location, under Act of March 3, 1875; of the remaining 110 miles, approximately 75 miles came from State grants, the bulk being to D. M. & M., and 35 miles from the Federal grants, the bulk being to M. H. & O.
947 Defts.' Ex. 41, Adams, sets forth the land grants to the several companies named thereon, being plaintiff's predecessors.)

I have made investigation, to ascertain amounts received by plaintiff or its predecessors in ownership of line of right of way it now owns, or other companies which received the land grants through such predecessors; this is presented by my tabulation. My information regarding M. H. & O. is taken from reports of Michigan Railroad Commission.

By looking into the history of this matter as far as it is possible without going to the records of the company, it appears that in 1881 there was a sale of land grant lands for two and a half millions of dollars, and I should not care to go any farther than to say that, in my judgment, these figures show that at least $2,655,702 had been realize from those lands; but, certainly, the figures indicate that more than that has been realized, because there are other balances prior to the year when that large balance is recorded.

I have taken that from the printed copies of reports of the companies as printed by the Railroad Commission, using the years 1880-1881. In other years, I also found considerable amounts, apparently proceeds of sale of land grant lands; the largest amount is for 1873, when the cumulative balance is $158,503.34.

With regard to the D. M. & M. lands, I found a statement of the receipts and disbursements made by the trustees of the land grant

mortgage, February, 1879, to January, 1911. In this statement, the following appears (from Moody's Corporation Manual):

948 Receipts:

From contracts and deeds	$1,949,071
From timber sales, cash and bills receivable	2,036,335
Interest	439,572
Discount and premium on bonds	1,197,234
Mining leases	74,054
Land leases	1,760
Cancelled applications	7,515
	$5,704,541

Disbursements:

Land department	$834,247
Paid treasurer D. M. & M. R. R.	3,318,318
Tax titles	65
Taxes	278,591
Interest on land grant bonds	1,196,800
Bills receivable (Demand)	70,000
Cash in bank	6,520
	$5,704,541

To determine the amount of benefit received by the railroad, it must be observed that the total receipts are $5,704,541, of which $1,196,234 are credited as discounts and premiums on bonds purchased; to this extent, therefore, the total is not a cash receipt. This deduction shows that cash or its equivalent of $4,508,307 has been received from sales of land, timber, mine leases, etc.; to arrive at the benefit accruing to the railroad, there must be deducted the expense of the land department and taxes, which leaves as a net cash benefit to the road $3,395,469. The D. M. & M. benefited at least to that amount by these lands. This is in addition to the $2,555,702 to the M. H. & O.

(This witness was later called to testify before the Court.)

949 On November 25, 1913.

Prof. MORTIMER E. COOLEY, a witness called by plaintiff.

Direct examination.

By Mr. Butler:

I am, and have for ten years been, the Dean of the Engineering Department of the University of Michigan; have been connected with that university for 32 years. I am an engineer by profession.

I received my technical education at the United States Naval Acad-

emy, Annapolis, graduating in 1878. In 1881, I was detailed by the Navy Department to teach steam engineering and iron ship building at the University of Michigan. On my arrival, I was made Professor of Mechanical Engineering, and I have had that title and position ever since. My profession is mechanical engineering and allied branches.

I have had considerable experience in valuation work. I have devoted practically my entire time, outside of teaching, to valuation work since 1899, and have directed or had to do with, or caused to be made, physical valuations of public service and railroad properties. The aggregate value of the various kinds of public utility properties I have had to do with is about twelve hundred and fifty millions. Those properties are steam and electric railroads, electric light and power plants, gas plants, water power and water power electric plants, and water works.

In 1900, I had charge of the valuation of the physical properties of all the steam railroads of Michigan, and in 1902 I assisted the Government in Newfoundland in the valuation of the mechanical elements of its railroads. Subsequently, I was Consulting Engineer in the valuation of the Wisconsin railroads, and I had charge of the revaluation of Michigan railroads in 1903 and 1905.

950 I have, in a general way, kept myself informed of the progress of valuation practice to the present time; I have had something to do with it every year since 1900, and have from time to time engaged in discussions, prepared a few papers, and made a number of addresses, and lectured on the subject for the past five or six years.

Among the railroads valued in Michigan at the times I referred to was the D. S. S. & A. I became as familiar with its property as was possible in my position as director of the work.

The amount fixed as the total value of steam railroad properties in Michigan was: The so-called reproduction cost about $200,000,000; the so-called present value about 82% of that, or something more than $160,000,000.

There is now a well known engineering practice on the valuation of public utilities, especially steam railroads. I believe the general practice followed in Michigan in 1900 has been followed in other states where valuations have been made, with some variations. Prior to 1900, there had been no physical valuation of railroads on a large scale. The method adopted in the Michigan valuation was to discover the cost to reproduce the existing properties, with all new elements, then to discover the extent to which the elements actually in use had depreciated, and to affect the cost for new elements by this depreciation, and to determine what we call the present value of the physical elements.

The method followed by me in Michigan has since been known as the reproduction method. That method has generally been applied where physical values of steam railroads have been under-

951 taken. I think the engineering practice has in general become settled upon the principles that follow in those valuations. There has been considerable discussion of different methods,

but I think the majority of engineers have clung to the practice inaugurated in 1900, with some variation in details.

Since the Michigan appraisals, I have given no attention to the South Shore, except in a general way, and have not been engaged by plaintiff to do work or testify for it in this litigation, and have had no formal conference with its representatives. I have had, in a general way, some idea of the progress of the work as it has been going on.

In a general way, in the light of the development of the practice since the 1900 appraisal, that is substantially the right way to ascertain reproduction costs of railroad property,—the one which has been followed,—and only the matter of overhead charges has been more completely elaborated than was possible in 1900. It embraces other elements, and treats them in slightly different ways, e. g., contingency, instead of being put in as a lump item spread over the entire cost, is now divided into two parts, at least, and distributed, varying in amount for the different elements, being larger for some and smaller for others. I have been accustomed to divide it into (1) contingency of construction and (2) contingency of inventory.

The contingency of construction is rather a variable item upon different roads. It is illustrated by such things as sink holes, unknown conditions surrounding bridge foundations, etc. The contingency of inventory is intended to cover the omission of things in the schedule. There never has been a complete inventory, I suppose.

In the Michigan appraisal, the contingency item was expressed by a given percentage of the physical items and some of the over-
952 head items; it was there taken at 10%. I should — 10% was as near correct as any other percentage. I have never found that I could depart far from it in my own practice; I have in a few cases dropped a little below, and in other cases gone above. I think 10% would apply to a property like the South Shore. The only question which might properly arise concerning a 10% charge might be as to the items to which it is applied, whether to the entire valuation, including overhead costs, or that excluding the overhead costs. My recollection of the 1900 valuation is not entirely clear as to whether we applied contingencies to overhead costs; we did apply it to the physical schedule, including lands; we applied it in the same way to all the railroads of the State.

Since then, demands have been made by engineers to ascertain the appropriate percentage which should be charged to each item. We attempted to be more specific in the application in 1900, but could not make any investigation, because that valuation was completed in practically 90 days. The nature of the items or costs covered by contingencies do not permit of such analysis as to enable the appraiser to apply an appropriate percentage to each item of the schedule. If the engineer could satisfy himself in advance as to precisely the right element to all for contingencies, he would not need any contingency item. Broadly speaking, the item is to cover the unexpected things in construction and omissions in inventory. Because items are unexpected, and the omissions unknown, the items are called contingencies.

(Objection to reproduction cost theory as immaterial and irrelevant in this case; this objection to stand to all testimony as to reproduction cost.)

In the absence of specific information which might be matters of record, and which would enable us to eliminate, to some extent, the element of doubt, I should not want to make an estimate of
953 the cost of D. S. S. & A. or any other railroad, without allowing 10% for contingency item. I should not want to choose any other percentage in preference to the 10%, unless I had the very best of reasons to do it.

The fact that on some items, as ballast, contingencies were much less than 10%, or nothing, would not impair the general truth of the statement or my opinion that 10% of the total would be about right. As to contingency applied to equipment, the railroad could reduce its contingency item by contracting to have equipment delivered at a stated price. This would not reduce the contingency item to the builder, which goes in the cost of it. As the contingency item is in the cost to the railroad, it does not have to allow another 10%, but must allow something less.

I have known of instances where the actual cost came below the estimated cost—not as related to railroads, though, but to buildings; I don't think of any such thing in railroad values just at this time.

I don't think there is very much to the claim that conditions which bear upon contingencies are different in case of an existing property and property to be built, where the conditions are not so well known. If the record showing the actual construction cost is available when the valuation is made, then you have information to enable you to eliminate a part, at least, of the contingency item, but, without complete records for the existing property, I think it is more liable to be far more accurate to determine a probable contingency cost from original specifications and plans that it would from an inspection of the property existing.

This is mainly for the reason that conditions existing at the time of construction are described in plans and specifications, and you can make your estimates accordingly, but, when you see the
954 structure after it has been built for a time, there is, or may be, no knowledge of the conditions under which it was built. It is almost impracticable to make a good estimate of the cost of a building without first having plans made to get the proper estimate of quantities. I am of the opinion, after a good many years of thought on that particular point, that it is not only possible, but quite probable, that a more careful estimate of contingencies can be made, from plans and specifications, when the building is first built than after it is built.

I think that would apply to the valuation of the South Shore, unless the actual costs are matters of record, and are available. The lapse of time since making the record might affect the matter seriously, because the conditions under which the work was done originally and under which it would now be done might vary greatly.

At the time of construction of a railroad, the quantities and classes

of material may, during the period of construction, be definitely ascertained, but on appraisal, when records do not disclose quantities and classifications, it is not easy to ascertain correct quantities and make appropriate classifications, unless care is taken to make careful measurements from the actual structure.

It is more difficult to determine the proper estimates years after the structure was built, and then there are many things which have gotten into the structures since they were built that did not enter into the original cost, such as the sinking out of sight of ballast. Before the work is done, the natural surface of the ground at the center line is known; after the work has been done, unless profiles and records have been saved to disclose it, it cannot be ascertained with accuracy, unless you make careful survey again.

955 In the Michigan appraisal, I applied at least 10% to all the physical items. In my opinion, the amount of contingencies varies among the items, some items taking none and some more than 10%. The application of the 10% was to arrive at a sum which would be fair to cover the item, including both construction and inventory charges. The 10% was a contingency item to be applied to the property as a whole, and not to the individual items; it would not be right to say that I had valued a specific item at the amount placed upon it plus 10%. In the nature of things, the item of contingencies cannot be defined, nor can all the things properly covered by it be listed, either in advance or in the work of the appraiser.

Overhead charges are so called because they are not capable of listing in an inventory as physical quantities, and they are usually applied as percentages based upon the costs of physical elements. The percentages are arrived at by experience. These overhead charges should be arranged in chronological order, cumulating one overhead charge upon the other. The first is organization and preliminary expenses—those prior to actual work in the field, e. g., discussion of the propriety or advisability of building a public utility. Mr. Riggs' inclusion of organization and administration was in accordance with the Michigan appraisal methods, but it did not come as a preliminary expense.

Such an item as organization and administration is proper to include in a reproduction estimate of an existing property like the South Shore. The practice of the engineering profession on this is somewhat variable, due, mainly, to ignorance on the part of the investigator.

The percentage to cover organization and legal expenses is applied as a blanket percentage over the cost, without regard to its being a certain percentage on a particular item. It varies with the

956 different items, as does the contingency item, but the amount which is represented by, say 2.5% of the cost of construction, if properly distributed, would cover the various items of organization and legal expenses.

We have been rather uniform in the percentage applied for these items in Michigan. In the earlier Michigan appraisals, organiza-

tion and legal was 2% more recently, it has been 2.5%. I doubt if I could answer as to the proper rate for plaintiff, as organization and legal expenses vary greatly, from less than 2% to as high as 4% or 5% in specific instances. The 2% we used in 1900 was as low as could be used, it seems to me, and must, as were lots of other figures than those used, be very conservative. I could not assign a range of percentages within which South Shore would fall, as I have not had occasion to investigate steam railroad properties with a view to determine a percentage range. In my opinion, based on my experience, I should say such a percentage as we have been using in Michigan is very conservative. In stating 4% or 5%, I had in mind conditions in New York, or Manhattan, where preliminary organization and legal expenses were upwards of 4%.

The contingency item is not properly an overhead cost; it is a construction cost, and belongs in the body of the inventory. The organization expense percentage should be applied to the contingencies.

There is a percentage of profit going into the cost of construction which would be added to get the total cost of construction. This is the contractor's profit; it might appear as a percentage or an actual amount. It may be covered in the items, themselves, and usually is. In the Michigan appraisal, we endeavored, as far as possible, to include contractor's profit in unit cost.

957 Again basing my statement upon personal observation and knowledge, contractors have made up schedules, when required to do so, in a way which would enable them to reap additional benefits from the items which were almost certain to be called upon as extras; in other words, they have made up false schedules, putting increased values upon things which are likely to be called upon as extras, and shading them in other particulars. I am not justifying that, at all; I am merely stating it.

In my own experience in making estimates, I have determined the costs of materials and labor as nearly as I could, and then added my contingency, of 10%, usually, to cover the things which were likely to be omitted, and then added another 10% to cover contractor's profit, and then, judging by the character of the work, have added still something more for uncertainties, as, for instance, having in mind specific kinds of work, after I have made my most careful estimates, including these various percentages, I doubled the entire estimate, to determine what I thought would be the bid we were likely to receive. It has been justified in my own practice. I have in mind today a bit of railroad work, under construction, where the actual costs were estimated at 20¢ a cubic yard, which, I think, is abundant to cover the actual costs; several bids were at the rate of 65¢ a yard, and the contract was awarded at 40¢ a yard.

A fair allowance for contractor's profit, where not otherwise expressed, in estimating reproduction cost of a railroad like the South Shore would be not less than 10%. Contingencies and contractor's profit, whether expressed by percentage or considered a part of the cost of the physical property, are a part of the base to which the overhead charges should be applied.

958 I have usually endeavored to apply the engineering and superintendence cost on top of the actual cost of construction, before applying organization and legal expense percentages, as engineering and superintendence are more closely connected with actual construction.

Engineering: I had rental and preliminary expenses coming in there which might be included in organization and legal expenses, as we have been using the term, or might be included in engineering, but, in the Michigan appraisal, our engineering, as we used it, did not include the preliminary location of the line, but the engineering actually needed in the construction of the line in the location in which the railroad existed. We did not have to make those preliminary surveys; we found the line there.

We included nothing in the Michigan appraisal for preliminary surveys; that work was done, as we imagined the railroad to be reproduced in the same location. The conception of the item of engineering in reproduction problems is different from what it would be in ascertainment of original engineering cost, including location of the line, etc.

In the Michigan appraisal, nothing was allowed for reconnaissance necessary to locate the feasibleness of the route. We took the roads on our original assumption where we found them; all that work was done.

Q. In that respect, the engineering item would be less than the money which was necessarily expended in locating a route?

A. Yes. Of course, this should be said: This preliminary expense, if an item were included as preliminary expense in connection with the organization charge, that might include, also, engineering incurred during the preliminary investigation, but, if you were to include the preliminary expenses under the head of organization at 1.5%, I should be inclined to suspect it would be rather small.

959 Q. As compared with what it did cost in fact?

A. Yes, that would be my expectation; I really don't know, as a matter of fact.

In the 1900 appraisal, we were not influenced by the fact that it was made for taxation purposes, except during the first three or four weeks, when positive orders were issued to forget the purpose and proceed precisely as an engineer in making the estimate of the cost of a new property.

The overhead charges of the 1900 appraisal were used in the later State appraisals, with slight changes. The only changes that we made in the subsequent appraisals, as I recall it now, was to affect our unit costs by the prices which were current at the date of the appraisal—labor and materials, principally. We also took in the extension of the property, and the betterments. In the 1900 appraisal, prices on rails and many other items were taken for a ten-year period, being the average costs during a period of depression and a period of prosperity.

The conception of the Michigan appraisals was that the railroad route had been ascertained, and that the country was developed, as it was in fact developed. Specifically, nothing was added to cover work

necessary to locate the line at the time it was built, but only so far as such costs might properly be included in the 1.5% allowed for organization. I have no means of knowing, as a matter of fact, whether the allowances were sufficient for that, or not, but, in my judgment, I should consider the percentages that we did use for organization too small to cover those things. That is also true of engineering. It might cover them for specific roads, but I should say it was a conservative figure as we applied it.

960 I do not think the 1900 or subsequent Michigan estimates included in engineering or organization anything to cover surveys of highways and routes and their construction. The percentages were agreed upon as representing our best judgment as proper percentages for reconstruction cost.

The reconstruction cost of physical items may be higher or lower than the original cost; some schedules might be much higher and others much lower in original cost, depending on change of conditions, prices of services, etc. Our conception was reproduction, and our aim was to obtain reproduction cost at the time.

I do not think I know how feasible or practical the original conception of the property and the actual original costs would be for use at the present time. Engineers omitted hundreds and hundreds of things, in getting at reproduction cost, that are not a clearly reproduction cost, though they were incurred as a part of the original construction.

The allowance for engineering varies for the different items, the same as engineering varies. It may be as low as 1% or 2% on some, and as high as 15% on other, items. Our practice in Michigan has been in the neighborhood of 4%, all told, usually distributed, a part of it on the items in the inventory, varied according to the nature of the item, and another general engineering expense over all. We thought we were conservative in using 4%; that embraced items as low as 1% and as high as 10%. A percentage should be allowed for engineering on equipment. I do not recollect whether we were accustomed to make it 1%, 1.5% or 2%; I have gone as high as 2% on electric roads. I do not know whether there is an established engineering practice respecting the allowance of a percentage for engineering on equipment.

961 Another overhead charge is insurance for the property and for the men during construction. My recollection is that we have used 1%, and in some recent cases we increased it.

The next expense would be interest during construction and taxes. In this part of the country, we have been accustomed to assume that money could be borrowed at 6% per annum, and to use a rate of 6%, allowing for one-half the total amount, which would be equivalent to 3% on the total for the period of construction. In the Michigan appraisal, we assumed that any new work would be put into operation and begin to earn at the end of the year, so the interest item was 3%, but recently, because of the longer period of construction, greater amounts have been considered proper.

In reconstruction of South Shore 6% of the cost of construction for one-half the time would be the very minimum; the earnings

could not be very great if you did get it into operation. In putting into operation a part of a line, it would not be right to take it out of the interest-bearing quantity, unless there was a profit sufficient to pay the interest.

In my handling of this problem, I have conceived the interest charge to cover a certain definite period agreed upon as the proper period of construction, and, after the road is put into operation, there are certain losses which have to be incurred, in the majority of cases, until the property becomes self-supporting in every respect, and there is another element of cost which must come in, distinct and in addition to the others, but which was not included in any of the Michigan railroad appraisals.

I have not thought of a proper period for construction of the South Shore road in entirety. I have not been over the property re-
962 cently. I should say at least a couple of years—possibly three—would be required before the property, as a whole, would be completed and put into operation. Of course, parts of it could be constructed in a single season, and put into operation at the end of the season. I suppose winter weather in Upper Peninsula might have considerable effect.

I understand the almost universal practice to be to allow at the rate of 6% per annum on the full amount required to reproduce the property for one-half the time required to produce it.

Two distinct ideas of depreciation are found in every public utility property. One, a fixed depreciation, is that which, once obtained, may possibly be maintained indefinitely at, say 85%; you have lost 15%, due to the fact that the property can never be brought back to its condition new. This is frequently spoken of as depreciation, and is what I term fixed depreciation.

The second depreciation occurs from time to time and must be made good out of earnings to keep the property at a percentage of condition that renders it efficient. The fixed depreciation, for which I used 15% by way of illustration, cannot be replaced. To obtain the 85%, you must first spend 100% and then must maintain it in perpetuity.

The 85% was simply illustrative of a condition that would be efficient; 85% would be 100% efficiency; in certain classes of property, 80% might be 100% efficiency; in other classes of property, it might require 90% to be 100% efficiency. In the 1900 appraisal, we found about 82% for all the properties of the state.

Depending on the kind of property, there would be a condition of maintenance—say, 90%, 85%, 80%, or possibly less—at which efficiency would be equivalent to 100% of a brand new prop-
963 erty. I used 100% to represent the cost of reproducing the physical parts, and 85% to illustrate the condition of a railroad property in use, and assumed that the 85% of physical condition would be sufficient to keep the property in 100% efficiency; that is, as useful for purposes of transportation as if brand new.

You can never have a property operated in 100% condition; it is impossible to maintain it with all elements new, there being constantly replaced new elements to keep the 85%, and, from the prac-

tical standpoint of an operating structure, the condition of 85% realizes the maximum efficiency of which the property is capable, and, being the maximum, is 100% efficiency. We might go further, and say that with the passage of a few years, which brings the condition of the elements of the property to a stable condition, it is more efficient than if brand new. The stability of the railroad can only be had with years of use. This stability is in the solidity of banks, settling of ballast, and ties in the ballast, and all those things, which make the roadbed safe, efficient and keep it in alignment and surface.

We have been obliged to spend 100% to maintain the property at all; we can never have the 100% back, but we can keep in perpetuity some percentage less than 100, namely, 85%, 80% or 90%, as the case may be.

With cost of reproduction $10,000,000, instead of indicating average condition of 85%, or $8,500,000, in applying these figures in the ascertainment of the ultimate question of the fair present value of the road, it may be said to be worth at least what it would cost new, unless the 15% has been restored to the investors out of earnings.

(Objection that discussion upon the point is foreclosed by the decisions.) As an engineer, I should say that a road well maintained which will inventory 85% of its new condition is worth as
964 much for use to serve the public as the same road would be, or was, when brand new.

I could not answer as to whether it would be practical or possible, having due regard to economy, to maintain the South Shore at a higher percentage of condition than 85%. It would be impossible to maintain a railroad so that it would inventory 100% condition. The average for Michigan for 1900, including good and bad roads, was about 82%, some being higher and some less. I would say, when a road was maintained at or near 85%, it was pretty close to the point at which the best results, economically, might be expected.

Some elements of the property appreciate in value with lapse of time and maintenance, being particularly that part of the roadbed below the ties. I have never given study to the subject, or attempted to analyze any railroad property with a view to determining what the appreciation might be. While we considered the elements in the Michigan valuation, we made no figures or allowances. It is my opinion that appreciation should be taken into account in getting at the present value.

Assuming two properties with reproduction cost the same, one brand new and the other 10 years old, the present value column of the older would be greater than that of the newer road. Perhaps I have not selected a long enough period to make the statement literally correct, but the principle would be the same. The appreciation comes about in increased solidity of embankments and increased thickness of ballast, which is constantly put under the ties and distributed in the embankments, thereby enriching them, making them more stable, improving the drainage, increasing the safety, in greater solidity and increased permanency of roadbed, and

the case with which the grades and alignments are maintained, thereby reducing operating costs in the hauling power and the
965 maintenance expense. Such appreciation of an old roadbed with lapse of time is recognized as a substantial element of value by railroad engineers, generally.

The increment would depend very much on time. I should not expect the appreciation of a roadbed to offset the entire depreciation of the physical elements from 100% to 85%. Any figure I would give would be in the nature of a guess; it would vary with different roads; it would depend on the character of the soil in the roadbed, and of the earth upon which the embankments rest, the height of embankments, character of slopes, cuts, etc.

I could not say, precisely, how the element of appreciation could be measured or estimated. I think it necessary to make a study from an economic point of view, rather than from a purely engineering point of view, i. e., compare the roads from an operating standpoint, with a view to costs of hauling over them and expenditures for maintenance. It would undoubtedly be a combination of both economics and engineering. I have no doubt that, from a proper study of a specific property, an approximate estimate could be reached with some degree of certainty, if the problem were approached in the right way. Every property would stand on it own basis.

I have made no study, whatever, except in the most general way. I have seen neither the reports of Mr. Hansel or Mr. Riggs on South Shore, and have not heard anything about them, except in a most general way. All my answers have been based on my general information and knowledge of the subject. I have not accepted employment by this railroad to do any work in this case for it. I declined employment two years ago. I have been employed by the State of Michigan in connection with its several appraisals, and I consider my services at the disposal of the State prior to anyone else.

966 COOLEY.

Cross-examination.

By Mr. Wykes:

The cost of reproduction method was first used in the Michigan 1900 appraisal.

In the 1900 appraisal, we were given unlimited funds, and I was permitted to do whatever I thought best, the only requirement being that I produce results before the expiration of the year. I had free swing in the selection of the men and the salaries paid. I was employed Aug. 27, 1900, and the value of the railroad properties was in the hands of the Tax Commission prior to Jan. 1, 1901, though not in final form, as the closing of the field work, checking, continued later, and a second set of values was submitted the latter part of January. The actual work continued from Aug. 27 until some time the next June, before the final reports were obtained.

After the preparation of the tentative report, we went on and made such corrections or alterations as were necessary to prepare as complete a work as we could be June. The work, after January, was in the nature of checking; there was no change of policies, and no re-valuations or re-inspections, as I recall.

The present value, as reached through the cost of reproduction less depreciation method, is not of necessity the value of the property, either for taxation, sale or anything else; it is just value of the physical elements. Its value for any purpose depends upon the purpose that you are using it for. The physical value or present worth may be greater or it may be less than the actual value in a commercial sense.

There is one value to the purchaser in a commercial sense, i. e., the ability to pay dividends, and another value to the community served, independent of dividends. I am not so sure that the
967 present value through the cost of reproduction method is not of necessity the value for either of those purposes. I won't say that it is or is not. The thought comes to my mind that the cost less depreciation might measure the value to the community, and that the community could well afford to maintain the property at its present physical value, in order to be served, without any regard to dividends.

The value found in the method I applied is not of necessity the same value as the value to the community, or the commercial value, though it might be coincidence be the same as either.

The application of the cost of reproduction method involves the conception of the removal of the property; to work it out would in fact require the removal. You cannot work out the removal; you cannot put the railroad back in this specific place, because there is another railroad there; so, instead of working the problem, it involves the conception. It involves the conception of the production from private owners of property now belonging to the railroad company; it would be impossible to work out in practice, because the property is not now individually owned, but the right of way is in the unity in which we find it. It involves the conception of the application to the real estate, not of the prices that put it there, but of the judgment and conception of what would be proper today with added multipliers.

The question of multipliers has, I think, gotten beyond the conception period, and into the practical period, in that it was easy to ascertain the going value of adjacent or nearby lands by reference to the county records of sales, and, also, from the same source, to find actual prices paid by railroads for new right of way in the vicinity, and thus to establish a ratio between the going value of the land and the actual price to railroads.

968 The cost of reproduction method has come into quite general use since 1900. I know of no engineer who claims that the result is commercial value, and I have never heard it claimed by anyone, though it might by coincidence be the same. I understood from the question that commercial value meant sale value, and an ability to pay dividends, as distinguished from necessity.

In some of the elements, it cost less to put the South Shore there than the present cost of reproduction affected by depreciation. I am not prepared to say that it presumably cost less as a whole; I do not know. On rails, and certain elements, the road would cost more when built that today, and on certain other elements would cost more today than when built. Where the matter would land, I do not know. I think it would — difficult of ascertainment, unless you had access to the records.

The work of the 1900 appraisal was as carefully performed as it could be within the time given to it. We were unlimited in funds, and fortunate in getting men of experience. We endeavored to do the best possible job in the time at our disposal, and I think we did a good job.

In 1903, I was again called upon to value 28 different railroads in Michigan, very nearly all the railroad property, in value, in the state being represented in the suit. The valuation proceeded along the lines and the same methods as the 1900 valuation. I do not know any better plan than that. The 1902-1903 valuation comprehended bringing the 1900 valuation down to date. I had done valuation work in the meantime.

In the work of 1902 and 1903, we applied the same percentages as in 1900; we simply changed the unit costs, and introduced cash on hand and stores and supplies, as I recall. The same overhead
969 percentages were added, straight through. We did not add 10% for contractor's profit; we assumed our unit figures covered that.

From 1900 to 1905, I was engaged in valuation work. In 1905, I superintended another appraisal of certain Michigan railroads. That valuation was made in great haste, to determine whether the State Board of Assessors had assessed the railroad property high enough. The public believed the values of the railroads were not high enough, and the Attorney General was requested to produce information, and he proceeded to produce it, with the result that the assessed value was quite considerably increased.

This was on the basis of a report made by myself and supplemented by Prof. Adams. In the appraisal of 1905, we added the additions and betterments, and revised our unit prices to meet the prices of 1905; that is what we tried to do. We had difficulty in getting information at that time from the railroads; some of them declined to furnish it as to the extent of betterments and extensions, and we had to get the information the best way possible. In those instances, we took them from their reports to public authorities; also from our examinations in the field, to a limited extent.

From 1900 to 1905 was a period of raising prices. In 1907, we had a period of depression which was possibly reflected or anticipated in 1905. Our values went from $2,000,000, in 1900, to $235,000,000 or $240,000,000, in 1902-1903, and to $285,000,000 or $290,000,000 in 1905; that included new construction, new locomotives, etc. In each of these later appraisals, there was on honest effort on my part to reach the value of the railroads. I believe we used the same percentages for contingencies and overheads in all the Michigan State ap-

praisals, and we are still using them in approximately the same way we did then.

970 In recent work for the Railroad Commission, I think my overhead charges are a little larger, in aggregate, than in the State appraisals. We have re-distributed them, though, and we still omit discounts and the cost of procuring a going concern. We still include contractor's profit in unit prices, and include contingencies, engineering, insurance, interest during construction, working capital and stores and supplies.

I have not, in general, kept watch of prices, and do not know whether they have been increasing, except in the most general way. I understand the general tendency of prices is upward, but I do not know that of my own knowledge.

In the 1900 appraisal, the unit prices covered a period of 10 years, so as to have a period of depression as well as of good times. In 1902-1903, our instructions were to appraise as of April, 1902, and in April, 1905, we used the date of assessment. I am not so sure that that would be inconsistent with the assumption that it would take one to four years to reproduce the property, as the estimates of cost of construction would be made at some particular time, and at the prices then current, though certain articles might be advanced and others decline in price before actually purchased. On the three or four year period of construction, I would not assume letting the entire contract at any time, because it would be the matter of a number of contracts covering different elements that enter into it in addition to contracts for certain parts of right of way.

I do not, at the present time, see any other percentage than 10% that I would prefer for contingencies; there might be occasions where the percentage might be shaded, and others where it might have to be increased, but, generally speaking, 10% would be fair to cover

971 contingencies. I had the feeling later on in considering the 1900 appraisal that we might properly have used a greater percentage, owing to the haste with which the appraisal was made, but it was good enough for the purpose, and was a common percentage to apply, and we used it, as engineers ordinarily use 10%. It is possible that the contingencies might have been considerably less than the 10%, and it might have gone much above.

I do not know whether I wish to subscribe to the statement that if the estimates were high enough the contingency percentage would have disappeared altogether. You can conceive that the estimates might have been made high enough, but, if they were, the contingency percentage would have been included in one form or another, perhaps not as a separate percentage, but it would be a contingency item, whether it came in as a percentage or in some other way.

The contractor, in taking a certain amount of work, say grading on 10 or more miles of line, assumes contingencies in his price. In any part of the work, if there is contingencies, the contractor bears more or less of it. If the contractor has properly made his price, he has included in it those contingencies he must himself sustain, and also his profit. To the extent to which the inventory is perfected, the percentage of contingencies to cover that grows less.

The contingency of construction would cover the unforeseen things that would be encountered during the construction process, while the contingency of inventory would consist of omissions from the inventory of items. If you could make the inventory perfect enough, there would not be any contingencies of inventory. That would not, of necessity, remove the contingency of construction.

972 The contingency of construction might be a sink hole. If a special percentage were added for sink holes, etc., it might or might not care for that, depending on whether it was enough. In the case of a railroad built in part three times, they would probably have to add for that particular element of the road 300%, because it would have to be built over three times. Another common contingency is bridge foundations, whether quick sand or floods are encountered or not. Another is where a train rushes on to a bridge during erection and wrecks it.

I have enumerated no specific items of contingencies as being inevitably in connection with the property; however, contingencies of some sort would be inevitable in connection with every property; their amount would be contingent, and it might be 7% or 20%, or even 5% or 40%, on individual items.

Ordinarily, a better estimate of the cost can be made from the plans than from actual construction. The incidents I have just referred to are illustrative of the reverse of that, where the actual result is better than planned.

The contingency of injuries to employees is usually included under insurance. We have tried, in our valuations, to include it there. To refer to it in both places would be duplication.

To the best of my recollection, our organization, administration or engineering included nothing for the preliminary expenses described. I cannot be entirely certain at this time, and my recollection may be at fault.

In recent work, I have been dividing the contingency of construction and that of inventory about equally; that is, assuming a 5% construction contingency distributed among the several

973 items in various percentages and then adding an overhead contingency of 5%, which I have called inventory contingency. I have assumed them to be equal, ordinarily, and have always aimed to have them around 8% or 10%, altogether—ordinarily, 10%; they might run under or over that, and the percentage of allowance would be variable as to different roads and as to different localities. It would naturally be variable and depend a good deal upon the completeness of records, especially the inventory contingency. In saying hundreds and hundreds of items would be omitted from an inventory, I had in mind individual items, such as tools and things of that kind; there could not well be hundreds of classes of items.

The contingency item on real estate in the 1900 appraisal, in the light of the second and third appraisals, was far in excess of the 10% we added, owing to the lack of time and opportunity to investigate actually the cost of right of way to railroads.

The 1900 appraisal was made under great difficulties, so far as the obtaining of information was concerned—both difficulties in not

having access to records and difficulties of determining the character and value of the land through which the right of way was purchased. My belief, at the time the figures were submitted, was that we were far under the actual cost of right of way. On an appraisal today, assuming the railroads to be friendly to it, and the books correctly kept, and possibility to ascertain the costs under those circumstances, I should not care to add a 10% contingency to items which were matters of record.

Even when you have made the best computation possible, it seems to me that there is still justifiable a contingency on right of way. If we had an absolutely true inventory, then we would have no need of contingency. I maintain and insist that a true inventory is absolutely impracticable, except in theory.

974 There is a possibility of getting unit prices and arbitraries for land and overhead percentages too high, as well as too low. I would not say there was a probability of getting them too high, the overhead charges, particularly, as the knowledge of the average man investigating public utility property is insufficient to give him a correct opinion of what actually takes place in the construction; they haven't the knowledge and experience of things which enable them to form a judgment.

It is my belief, after many years of special investigation and study, that the average mind does not comprehend the actual expense incurred, both in the construction and in the overhead charges, particularly in the overhead charges. In saying the "average mind," I applied it to the man whose experience has not been special along these lines. To illustrate, a prominent engineer said to me, of overhead charges, "I dare not consent to their appearing as so and so, because the public won't believe me." By the average mind, I mean the average citizen, who has not had experience in these things, to whom the engineer makes his reports. His idea was that these percentages must be tempered with what will be accepted.

The overhead percentages are often and entirely estimates based upon experience with similar properties, and not matters of actual ascertainment. There is no way of checking them, absolutely, without carefully kept records of expense, as the property is actually built. There is no way of furnishing an absolute check as to what the conditions would be on the specific property, because the reproduction cost is an estimate. It is the same kind of an estimate that the engineer or contractor makes in connection with new plans; it is his judgment, based on his experience.

975 I am not a constructing engineer, in the sense of taking contracts and building things myself. In earlier days, I made plans, superintended actual engineering work, and had opportunity to ascertain the difference between estimated and actual costs of construction in certain kinds of work, particularly those relating to mechanical engineering.

In recent years, for public utilities property, I have worked for both the public and the corporations. I have had access to the books and records, and counseled with expert accountants and others in their analysis, and it has thrown upon my own experience a light

which was before impossible. None of the books contained a separation of the charges into the items I used in my appraisal. I have had opportunity to investigate costs, operating expenses and depreciation in electric street railways, where eight or ten groups were possible of separation, but not 30 or 40 groups, as in the Michigan appraisals. Not from my personal examination, but from examinations by public accountants, it has been possible to separate contingency or similar items so as to determine percentages.

On grading, I would expect contingencies to arise from lack of information regarding character of soil, e. g., estimates of earth actually found to be rock—an extreme illustration.

It is difficult for the contractor, in making estimates of cost in expectation of building, to say when he will encounter rock or hard pan; it is also difficult for the engineer, in going over a right of way for purpose of making an appraisal.

That contingency bears upon the classification and the arriving at greater or less quantities of higher priced material than is
976 actually there. The estimate of rock may under-run or over-run the actual quantities moved; the error of classification may go both ways, and the rock moved may be greater or less than provided for in the inventory.

Sink holes and other things which come in are frequently very likely to be serious when encountered. I do not know whether you would expect one or more on a long construction, or not, unless you are entirely familiar with the country; in that case, you might figure on them. I doubt whether I could mention any other than one specific instance; I remember that case, because it was nearby and notable. In Southern Michigan, I should say, sink holes are encountered quite generally, though I cannot instance another case. My impression is that the Grand Trunk had a similar trouble east of Lansing; the Michigan Central had similar trouble between Dexter and Jackson, years after the road was built.

Q. Are there any other contingencies that you desire to refer to or that you can refer to in the item of grading?

A. I haven't attempted to make up any lists of contingencies; I simply mentioned the things which occurred to me, offhand. I haven't given this any thought with a view to making up lists that would enable me to answer the question completely.

Q. You have no more in mind now with reference to the item of grading?

A. Not at this particular moment.

There would be less necessity for a large contingency item on ties than in other elements of construction. As I recall it, I think we omitted freight on ties in 1900, through oversight. I mention that as a thing liable to happen in making up an inventory. I
977 think anyone, even though having had great experience in inventory and appraisal work, will say that there never was a complete inventory, and that it always falls under, and never goes over, so far as the inventory schedule is concerned. I do not mean as far as the prices are concerned.

On ties, rails and track fastenings, contingencies would not be likely to occur in inventory, but might occur on prices, because of delivery, distribution, delay of material to arrive, etc. On ballast, contingencies could occur on that sinking out of sight; it might be estimated as 12 inches thick when it was in fact two feet.

I would not appraise as ballast that which had gone into the fills. The ballast going into the embankment to a greater depth than, say, 9 inches would be covered by contingency item. The actual quantities present would be treated and included at grading prices. The ballast over nine or twelve inches below the tie would not have been put there at ballast prices as fill, but would have been put there at fill prices, and would have been fill material, if it had not been for the conditions that forced it down there. This ballast should not be included in both contingencies and in amount added to cover solidification and incident items.

The ballast, generally speaking, put into the road after the first construction is a maintenance charge, and goes to operating expenses. This is renewal of ballast. The practice is to replace a portion of the road, continuously, every year, rather than the entire road.

Take 20 miles of road, ballasted six or seven years ago, with no general re-ballasting since, presumably, the time is approaching when there must be a general replacing of it, if it is to be kept to 85% of condition, or 100% of efficiency. There might or might not be a depreciation in the ballast, for the ballast that is
978 there might be just as good as ever, but it is replaced for the purpose of bringing the road into alignment, or correcting the grade, or something of that sort, more than because the ballast is worn out. When put there, there was no present necessity of putting other ballast there. A time arrives when more ballast must be put there, to keep the road to the percentage of operating efficiency desired.

Good management requires more ballast there, because the old ballast will not longer serve the purpose of good railroad operations. From the standpoint of efficient railroad operation, that ballast must be replaced or supplemented, and, therefore, has depreciated. Railroads do renew their ballast whenever necessary, and they do it to improve the conditions of operation. The ballast gets out of place; it can be, and is, replaced, by putting additional ballast on top. To use the same ballast, without adding new, you would have to remove the ballast and bring the earth fill up. The ballast itself has not depreciated, but has gotten out of place; it has depreciated by no longer being in the place where it ought to be to serve the railroad purpose as ballast.

The contingency which we might find in labor would be that you might have estimated that it cost so much, or took so much labor, to perform the work, and it did not take that much, or it took more. It is liable to go both ways, but, as a rule, it goes one way, as the contractor desires the work, and makes his bid as low as he can. If there is a contract at a certain price per mile for track laying and surfacing, the contingency goes on to the contractor; it is there, nevertheless, and the engineer makes the same mistake. Both the

contractor and the engineer, in figuring the unit price, take account of the elements of uncertainty; they would make them too small, rather than too large, but they may get them too large. They are far more likely to make them too small, because of the desire
979 of everybody to do the work, if it is possible to do it, and because of the realization that if the costs are too large the work won't be done at all.

Q. Is that susceptible of the conclusion that contractors ordinarily lose money on these jobs?

A. No, I don't think it is.

Q. And they don't ordinarily lose money?

A. I don't think they ordinarily lose money on these jobs.

Q. They ordinarily have the price high enough to get their profit?

A. They ordinarily have their price high enough to come out ahead of the game, but not necessarily to get the profit which they estimated. They may get more than the profit which they estimated. I have several cases in mind, very much more. And they often come out just even, and they occasionally come out in the hole. But the tendency, I think, without any question, is to under-estimate rather than to over-estimate.

The 4% for engineering in railroad appraisal work was adopted in 1900 as the result of a conference of chief and maintenance of way engineers and others who had spent their professional lives in railroad construction. They agreed upon that as fairly representative of the cost. I have taken the consensus of the opinion of the men associated with me, rather than making any computation from point to point to get the percentage.

For some steam railroad work, I have never attempted any detail work to verify the percentage, though I have verified it in other cases. The 4% is low, as compared with other work, e. g., architectural and mechanical engineering. The average construction work engaged in by a mechanical engineer may represent $50,000,
980 or $100,000. The labor and time required for plans and specifications for a small job is about as large as for a big one, and, proportioning this cost on a small job, it sometimes goes as high as 20%, but, if you increase the cost to, say, ten time- as much, it might fall to 2% or 3%. It depends, to a considerable extent, upon the amount of work.

This system would not apply to railroad work, as that embraces a large amount of territory where a mechanical job—e g., power plant—is in a single spot. There would be a variation due to the extent of the work even on a railroad. On two similar properties, the greater in extent and cost would bear the less rate of engineering.

It might easily result that a closer estimate could be made from plans and specifications than in inventory of a constructed property, where there were no plans and specifications. This applies to contingency of inventory, as well as of construction. It is possible for a more complete inventory with the constructed property, but I do not say it is probable. The possibility depends upon the completeness of the research. With plans and specifications showing in detail all the

things you are bound to incorporate in a building I believe it is more than possible to do a better piece of work in advance than after the work is done.

There is the possibility, if you were to obtain every bit of information, taking time and incurring expense,—but I am unable to say that it is at all more probable,—that you would reach a better inventory from the building actually constructed than from having plans and specifications before you. The more I have gone into it, the more confident I am that a better estimate can be made from
981 plans and specifications than from the structure itself. If you have the plans and the structure, I think you can reach a better inventory after construction than before.

Changes in almost all work take place, more or less, during the progress of the construction work, and would vary in estimate made from the original plans. In railroad construction work, the estimates are based on computations from profiles, and then they are changed more or less from actual measurements afterwards. There, the plans might not furnish any actual indication of what was done.

Whatever the added value of a railroad, by reason of adaptability, solidification, etc., would be in proportion to the period of operation up to a certain time, after which it might not change very much. I should expect it to go on in a moderate degree. I should say this would go on more rapidly in a railroad well maintained than in one not so well maintained.

The adaptation, etc., does not occur from operation alone, as an embankment without use would improve as years went by, though not maintained; e. g., it has grown to be more nearly like the original earth, and gets the qualities which come with that solidity that accumulates with the years regardless of any use of the surface.

The equipment today is perhaps twice or three times as heavy as it was 20 years ago. We are using locomotives at least three times the weight of those that were used in 1900, when the appraisal was made. The bridges have all had to be rebuilt, the rails have had to be renewed and increased in weight, and many things have taken place in the last few years in railroad traffic which seems to me might easily have disturbed the condition of the embankment over what might have taken place if the increase in weight of rolling stock had not come about.

982 I have never known of the appreciation due to adaptation and solidification being charged into capital; I think it is a condition of value which has come about without appearing in the books, except as an operating cost. In a greater or less degree, this goes on forever, except as it may be modified or affected by the heavier traffic now on railroads.

In stating, yesterday, that on certain items the engineering charge would amount to 15%, I referred to a railroad in which there is a power plant involved. I did not refer to South Shore. The shops, electric light plant, and things of that kind, on South Shore would have to be rather small to make propert a 4% engineering charge for the entire property. On some of the items, the engineering per cent might — 1%; I put that as a sort of minimum.

The engineering on equipment would run less than on something else. I do not know that it would be as low as 1%; it might run down to half what it would be on an average; I do not know where it would land. It would depend upon how much time was required in localities served by South Shore to determine the fitness of particular equipment. I do not think the percentage can be expressed as a particular item, talking at long range, as we are. I think the engineering percentage must be the best judgment of the man actually engaged in the work, and who found the percentage by experience. The same would be true of organization, legal expenses, and, in a measure, administration.

The theory of reproduction cost takes the value, today, of all elements,—land, labor and materials,—regardless of the cost. The contingency percentage would be figured, not upon the original cost to put the structure there, but upon the increased cost which represents the value of the elements today. The same thing is true of every overhead percentage. Assuming a multiple applied to lands,
983 that would be applied on today's prices, regardless of original cost. The reproduction theory disregards the history of the railroad, and takes the conditions as of the date when the valuation is made. The reproduction on South Shore might be more and might be less than the original cost. I would doubt its being less without a careful examination.

Assuming a structure having a 20-year life, and now carried at 50% condition, presumably, at the end of the 20 years it would be a matter of economy, and add to efficiency of operation, to renew, but it is quite possible to maintain the property in 50% condition indefinitely. I think 50% condition would be proper for a structure that would be replaced next year; it might be even higher. 50% does not necessarily indicate that half the normal life remains; it might easily result that a property maintained in 50% condition is producing earnings that would be equivalent to a property maintained in 85% condition; e. g., ties in a low condition permit the doing of business the same as if they were in 85% condition.

It seems to me that as long as the ties are used with reasonable safety they are entitled to have a value assigned to them, because they are performing the service of a more expensive tie. This, regardless of the fact that next year an expenditure must be provided out of operating expenses to replace them. As soon as that tie is in use to carry traffic, it has a value. It is a matter of record that the average condition of all the ties for all the railroads in Michigin for 1900 was 56%; that comprehends nomal replacements, and it is a matter of common engineering knowledge that, so far as railroad ties are concerned, they always exist at a value of between 50% and 60%.

If a particular group of ties stood at 35% condition, and it was possible to do business over them, they ought to be entered on the books as of 35% value. I am speaking of the physical life.
984 In a building, with a normal life of 20 years, that is within one year of having run its life, that structure should be carried as in 50% condition, as it is doing the work of a 100% structure, and, therefore, must have value. The 100% condition will carry,

without more investment, the work of the road that it performs for 20 years.

Q. The 50% condition, under the illustration, will carry it but one year, is the percentage correct?

A. There is where you have fallen down in your statement, or in your argument, or in your thought. The structure of 50% condition does not of necessity become valueless next year, because it can be maintained indefinitely in a 50% condition; it is question of whether it is expedient to continue that structure in the service of the company; it may be inexpedient; it may be altogether desirable, from an economical point of view, to replace it with a new structure. But you can maintain that structure in a 50% condition indefinitely. The structure has presumably become obsolete if it has to be replaced in the near future. Obsolescene is one element of depreciation.

Q. When you take depreciation coupled with obsolescence, that structure is carried at too high a percentage, if it is carried at 50%; that is true, is it not?

A. I won't fix any percentage as representing what it should be carried at. I am not contending for that. I am contending for the general principle that a structure can be carried at any desired percentage indefinitely.

In a structure of material which depreciates, you can constantly renew the worn out parts, which will always maintain it at some particular or desired percentage of effectiveness and efficiency. It may be maintained at a given percentage, and, as long as it is
985 so maintained, it can continue to perform the service for which designed. It may not be economy to do so; it may be far better, from a standpoint of economy, to wreck a car, save its scrap value, and put in a new car. There are plenty of examples of obsolescence making machinery in almost any percentage of condition valueless for continued service.

In making a valuation of a railroad, if a bridge were found in 50% physical condition, and it was known to be insufficient to carry the traffic, and known that it would be replaced next year, I would not consider that obsolescence, in putting on the percentage of condition, and would not reduce it below the 50% of physical condition that the inspection showed it had.

COOLEY.

Redirect examination.

By Mr. Butler:

It is the practice to include an item in cost of reproduction for working capital. This is usually arrived at by examining the books, to discover amounts necessary to carry on the business in the past. I recall no case w-ere we departed from the amount actually disclosed to have been necessary in conducting the business; it may be either more or less.

The history of the development and use of the property and the costs from time to time incurred is used as a guide to what is right

in reproduction items, especially for working capital and going concern cost. For promotion, administration cost and general expenses during construction, the history of the existing property and similar properties recently created, where fully and correctly recorded, is used by reproduction appraisers in reaching just conclusions and establishing right figures, particularly in the case of interest during construction.

986 Contingencies is to cover errors in estimates, deficiencies in unit prices, etc. The 10% in 1900 was found too small to cover such errors, omissions and deficiencies in allowances on lands, and subsequent experience indicated that 30% to 50% should have been added to that item. The land values were altogether too small in 1900. We did add 10%

There need be no contingency if a sufficient sum be estimated for each particular item, or if each particular item includes contingency, but I cannot seriously conceive of such a condition existing in any property. Land is an item where a contingency percentage over the whole item is necessary. It is more expedient to make use of a contingency item than to attempt to secure greater accuracy by prolonged investigation. I do not see how it would be possible, and do not think it practicable, to apply a contingency for each parcel of land. The uniform practice among reproduction value engineers is to apply a contingency to the land item. I have never known of an appraisal involving land where a contingency was not allowed, nor have I ever known of an estimate of any kind being made by a competent engineer where contingency was not allowed. I did not know that Mr. Hansel did not include a contingency for land.

Mr. Wykes: The novelty is that the Supreme Court of the United States has agreed with Mr. Hansel on that precise point since he made that schedule. (See 230 U. S. 455.)

Mr. Butler: The novelty about that is that Mr. Wykes is mistaken.

The Witness: And a still further novelty is that the Supreme Court, if it did that, is absolutely, utterly mistaken.

The uniform practice of reproduction engineers is to add contingency item to bridges, trestles and culverts.

987 Contingency item includes unforeseen conditions in performance of work, e. g., inability or difficulty to secure transportation of labor, strikes, weather conditions, etc. It is the uniform practice of reproduction engineers to add contingency percentage to item 6, Ties, and also to all items of construction. Items 7 to 15 inclusive of Hansel's appraisal all being elements of construction, an engineer would allow a contingency item on them, and I know of no reason why contingency should not be allowed on items 17, 18 and 19 of the appraisal.

The allowance of 10% contingency does not indicate that amount chargeable to the property in each item, but that it is a correct allowance for the whole, as there may be contingencies on some items and not on others. In recent application of contingency percentages, they have been applied in varying amounts to the different elements,

but, in the aggregate, they have approximated 10% of the total cost. The inventory contingency is usually applied as a blanket percentage at the end of the construction items. In recent years, I have endeavored to apply the most suitable contingency to the items making up the schedules, and afterwards the blanket percentage of the same to the whole.

Likewise, in engineering, in recent years, effort has been made to apply to the different elements of the schedule a proper, and afterwards a general, percentage. The aggregate would remain the same, but this is the much more logical application. Items 20 to 28 inclusive should each have a contingency applied to them; that is the uniform practice, as far as I know.

The practice is to allow contingency upon the equipment items, though not usually on the overhead items. In the 1900 appraisal, we applied it to everything. At first, it was the practice to apply the contingencies to the overhead items, but, lately, this con-
988 tingency is thought to be a part of the actual construction. The other overhead items are, today, usually applied to contingency and other items, except overhead.

Mr. Wykes: I wish at this time to call to the attention of counsel for the plaintiff certain things which I think it is their duty to prove in this case, and the duty of every railroad company to prove in cases of this character.

The defendants call upon the plaintiff to, and demand that it do, make proof of each of the following matters and things. The defendants hereupon agree that the plaintiff shall be given a reasonable period of time in which to make proof of said items and things, in case it shall announce upon the record its purpose and desire to comply with this request and demand, and make such proof.

(1) The fair value of the property used by the plaintiff for the public, other than and separate and independent from and in addition to the cost of reproduction affected by depreciation to represent present condition.

(2) The original cost of construction of the property used by plaintiff in serving the public.

(3) The amount expended in permanent improvement upon such property since acquisition.

(4) The amount and market value of its stock and bonds.

(5) The present, as compared with the original, cost of construction.

(6) The unearned increment, meaning thereby the increase in value due to causes other than earnings and other than investment of additional capital by the plaintiff in lands owned by it,
989 including the amount of such unearned increment accruing or added to the value of the property from year to year.

(7) The unearned increment in property other than land, due to increases in prices of labor or material, or otherwise, and the amount thereof accruing or added to the value of the property from year to year.

(8) The amount of right of way and station grounds donated or

granted free of cost by the Federal Government for right of way and station ground purposes.

(9) The amount of right of way and station grounds donated or granted free of cost by the State of Michigan for right of way and station ground purposes.

(10) The extent and amount of all land grants or donations of land other than for use for right of way purposes and as station grounds by the Federal Government as an aid to the construction of plaintiff's railroad, or any part thereof, whether such land was granted or conveyed to plaintiff directly or indirectly, or to or for or on account of any of its predecessors in ownership of the said line of railroad, or any part thereof, directly or indirectly.

(11) The extent and amount of all land grants or donations of land other than for use for right of way purposes and as station grounds by the State of Michigan as an aid to the construction of plaintiff's railroad, or any part thereof, whether such land was granted or conveyed to plaintiff directly or indirectly, or to or for or on account of any of its predecessors in ownership of the said line of railroad, or any part thereof, directly or indirectly.

990 (12) The proceeds from the sale of all land grants or donations by the Federal Government, whether received directly or indirectly, and when and how received.

(13) The proceeds from the sale of all land grants or donations by the State of Michigan, whether received directly or indirectly, and when and how received.

(14) The commercial value of the property used by plaintiff in serving the public.

Appreciation takes place by use and lapse of time, without regard to work or expenditure of money on the roadbed; the embankments, fills, etc., all become more solid, and more like the earth, originally, before it was disturbed. An old seasoned and appreciated roadbed would withstand the strains of faster trains better than a new roadbed. The increased weight of equipment, loads, speeds, etc., has required considerable change in the standard of construction of the roadbed and its structures, particularly in bridges, rails, etc., and more substantial ballast and things directly affected by heavy wheel loads.

The average speed per hour of freight trains is unbelievably low, because they need terminal facilities, better organization, and more actual energetic management. I believe the average railroad, today, which is not paying returns might very properly pay a very good return if it only heeded a few of the things which are so essential in other kinds of business—efficiency of operation. I am speaking generally; I don't know about the South Shore, and have not seen it in many years.

991 COOLEY.

Recross-examination.

By Mr. Wykes:

The reason for my answer that, assuming a bridge would be put out of office within a year, it would be right, in making reproduction estimate less depreciation, to carry that bridge at 50%, was this: All structures suffer depreciation. It is the common practice to figure the depreciation by the so-called straight line method as distinguished from the sinking fund method, it being simpler. A new property may depreciate steadily, we will say, from 100% to 50%, by the straight line method, and then the curve of depreciation maintained horizontal throughout the remaining years of its use, by applying such repairs to the elements of the structure as will keep it in a 50% condition; eventually, it has to be replaced, for economic reasons, we will say; when it is replaced, then the horizontal line at which it has been maintained for a number of years drops vertically to the scrap value.

I think, without any question whatever, that it is quite the proper thing to maintain the property at whatever percentage it may exist in and can be used in throughout the entire period of its use.

It is necessary to maintain a bridge at some percentage of condition above junk value, to use it and run trains over it. In my practice, I have insisted that all things in use must not be depreciated below a certain point, and they cannot suffer from further depreciation until they are wiped out of existence; this is applied to practically everything. In my understanding, the Master Car Builders' rules indicate that it is the opinion of car builders of the country that if a car be roadworthy and proper for use it must be maintained at, say, 40% whatever the per cent is. It is my idea that you must not go below a certain percentage, which represents a safe condition, until after the property is actually disposed of.

992 On December 31, 1913.

F. L. BATCHELDER, a witness called by plaintiff.

Direct examination.

By Mr. Eldredge:

I am Chief Engineer of the Copper Range. I am familiar with the topography of the country west, south and southeast of Houghton, and with the South Shore road, St. Ignace to Houghton, and especially in the vicinity of Houghton. In my judgment, the South Shore right of way, Chassell to Houghton, has a special adaptation for railroad purposes, chiefly from Pilgrim River west to Houghton. Pilgrim River to Houghton, the South Shore occupies the only logical location for a railroad, taking into consideration the cost of construction. Its

entrance to Houghton is on the most easily constructed of any possible entrance from the south, southwest, southeast or west.

West of Houghton, you run into Lake Superior, about 18 miles away. The Copper Range enters Houghton from the west and southwest, but its location cannot be compared, in cheapness of construction, with the South Shore; it is one of the heaviest pieces of work yet put in. It is mainly constructed, south of Houghton, through or on a range of hills, for the purpose of serving the copper mines existing or possible south of Houghton. They could have entered Houghton with lighter grade and less work from the east than on the location occupied; a survey was made in that direction.

The next most available line into Houghton and avoiding the right of way of the South Shore, Pilgrim River to Houghton, would lie on the lake side of the South Shore right of way, practically paralleling it. I have not located such a line by actual survey, but by close reconnaissance and by the use of existing topographical maps. An entering line could, and probably would, parallel the South Shore practically the entire distance from L'Anse to Houghton, but it would be a close parallel, Chassell to Houghton.

993 A crossing would probably have to be taken to bring the line to the Lake side between Chassell and Pilgrim River. This special adaptation for railroad purposes, Pilgrim River to Houghton Terminal, consists in the fact that it is the most cheaply constructed line possible between those points. The value of such special adaptation may be measured by the difference in cost of construction of the existing line and of the next most feasible line paralleling the South Shore between those points.

I have made an estimate of the cost of construction, exclusive of track material, which we consider equal, and exclusive of cost of right of way. This estimate is based on the possibility of passing in front of the South Shore terminal, and includes to the west line of the South Shore terminal lands. All the elements of adaptability of the South Shore road which I have given apply as far as the west line of the Houghton Terminal.

Estimated from profile, the quantity of earth between Pilgrim River and the west line of the Houghton terminal we find is 16,000 cubic yards of earth to be moved, which, at an average price of 30¢ per cubic yard, amounts to $4,800, to which should be added engineering and superintendence of about 5%, or $240, making a total of $5,040. On a line approximately parallel, passing outside any existing tracks of the South Shore between Pilgrim River and the west line of the Houghton terminal, we have 37,000 cubic yards of earth, at 30¢, or $11,100; 2,500 cubic yards of rip rap at $1, or $2,500; 2,100 lineal feet of pile trestle,—this estimated trestle was made from soundings and average conditions as I know them around the lake,—$25,275. A small plate girder draw span, to permit scows and tugs to reach a stone trestle of the South Shore, $12,000; 51,000 cubic yards of earth fill, to be made with steam shovel for replacing trestle of permanent construction, at 15¢, $7,650; 3,000 cubic yards of rip rap on same fill at $1.00, $3,000; 1 mechanical interlocking plant at crossing of line near Pilgrim River,

994 $2,000; total, $63,525; engineering and superintendence, 5%, $3,176.25; total, $66,701.25, or an excess cost of this line over the present South Shore line of $61,661.25. On my theory, the interlocking plant and the engineering percentage on it, $2,100, should be deducted, making the difference in cost $59,561.25.

The terminal lands of the South Shore at Houghton have a special adaptation for railroad purposes, which consists in the cheapness of construction of the yard. The South Shore terminal yard at this point occupies a piece of land of suitable area for yard purposes which could be, and was, adapted, in the state of nature to such use, due to the fact that it was practically a flat or very gradually sloping piece of land of suitable area between the foot of the bluff and the lake front. There is no piece of land between Pilgrim River and the west side of Houghton, until you are west of the Copper Range yard, which, in the state of nature, could be built into a yard with little expense. The larger portion of the Copper Range yard, which is west of the bridge across Portage Lake, was blasted out of solid rock, and the rock moved out to fill into the lake, and revetments were constructed along the harbor line, to retain the fill. This was the most available place for a yard by the Copper Range road, when it was built. It is impossible to state exactly the amount of yardage of earth moved to make the South Shore yard, but indications on the surface at present, from the depth of water in front, the average slope of the ground between those soundings, and the height given on the profile, show the surface of the ground at the center line of the main track at the time the road was built, and from the existing conditions along the shore, wherever a flat of this kind occurs, I state that 30,500 yards of earth work, at 30½¢ per cubic yard, or $9,150, plus 5% for engineering and superintendence, amounting to $457.50, or a total of $9,607.50, is a conservative estimate of the cost of grading that portion of the yard not already included in my main line estimate.

995 The next most adaptable land upon which a yard of equal value may be constructed and connect with the line, next most feasible to that of the South Shore, would be the strip lying on the north side of the Mineral Range track and extending from the west end of the South Shore terminal approximately to Portage St., in Houghton. From Complt.'s Ex. 16*a*, the length of the South Shore yard shows 1,568 feet. The length of this proposed yard would be approximately 2,000 ft.—narrower than the South Shore yard, yet approximately the same area.

To make this strip available for yard purposes, it would be necessary to fill in four different portions of the Lake front and build revetment to maintain the fill inside the harbor line. This filling would amount to 67,000 yards, at 30¢ a yard, or $20,100; 750 lineal feet of crib revetment at $50 per lineal foot, $37,500; total of $57,600, with engineering and superintendence of 5%, or a total of $60,480, from which we must deduct the estimated cost of grading in the South Shore yard, leaving $50,872.50 for the excess cost.

I did not have my proposed line cross the South Shore track and build my yard on the south side of the South Shore track and avoid

all this filling in the lake, because the natural condition of the ground surface over the parallel strip on the south side of the Mineral Range tracks is such that it would render the cost of construction higher than that on the site selected. There would be more earth work and the possibility of striking rock, enough to render the cost of construction greater; if a question of property values would enter there, that would also increase it. The property on the south side of the Mineral Range track is so built up and occupied by manufacturing plants and other buildings that the cost of acquiring the land there would undoubtedly be far higher than on the lake front, where there are a very few buildings.

From the natural conditions along the right of way of the South Shore, and along a possible paralleling line on the route described,

I can see no reason why the value of the property in the state
996 of nature along the proposed line should not be the same as along the South Shore right of way, as the conditions are practically the same. The South Shore line follows a side hill at a short distance above the lake, and in most cases the slope of their fill runs into the waters of the lake, and the parallel line would occupy a practically similar position—it would be either in the water of the lake with its slopes, or directly adjacent to the South Shore right of way, where it crossed already existing lands above the surface of the water. The damage to abutting property would be the same.

It is my judgment that the difference between the cost of construction of my proposed line and of the South Shore is the value of the special adaptation of the right of way of the South Shore between those points, and that the difference between the cost of creation of the yard on the South Shore terminal and upon my proposed new yard site represents the special value for railroad purposes of the South Shore terminal land, meaning the 1,550 feet of water front to which I have heretofore referred.

In giving the elements that make up the value of the special adaptation of these two parcels of land, I confined myself entirely to differences in the cost of construction. In determining generally in reference to land having special value by reason of adaptation for railroad purposes, it would, in my judgment, be proper to include a capitalization of the difference between the cost of operation of the property having special value and that of any other property which could be obtained to take its place. In case of a yard, it would be difficult to arrive at a definite conclusion; naturally, have to lay out the yard, and figure your switching movements, and comparison of the two yards, and then, from that, attempt to arrive at the additional cost.

997 BATCHELDER.

Cross-examination.

By Mr. Wykes:

Mr. Wykes: I move to strike out the entire testimony of the witness on the ground that strategy of position is not a proper element of value in a rate case; second, because the witness' conception of the method of fixing value of a railroad right of way is entirely improper and fanciful and conjectural and is based upon the conjecture of locating something alongside of this railroad, and in the third place on the ground that the entire testimony and the entire theory is immaterial.

I know of no other railroad seeking an entrance to Houghton, at present, from the east, and have not heard of any such for the last five years. The South Shore, the Mineral Range and Copper Range enter Houghton Village proper. Other railroads in the immediate vicinity have connection with those roads. The Copper Range forms a direct route to points south and west, by connection with the C. M. & St. P.

From the east terminal of the South Shore to Pilgrim River, there is practically no natural level land between the bluff and water, except small points that break out at intervals. The fill or stamp sand that constitutes the tailings from Isle Royal mill, is not natural formation. Today, there is less than half a mile in length along the lake where the level land extends an appreciable distance beyond the South Shore track toward the lake; the bulk of that is stamp sand from Isle Royal mill.

Between Pilgrim River and the east terminal, there are about four places that extend a hundred feet or over from the foot of the bluff out into the lake. Approximately three-quarters of a mile, total distance, it is a hundred feet or over. The imaginary line I have

998 located was entirely off the South Shore right of way, east of the Houghton terminal. There would be no advantage gained in locating it at places on the South Shore right of way, because where you are not in the water the ground is practically flat. At approximately three places, a total of one-half mile out of 2½ miles, the South Shore road is directly on the face of the bluff.

To make these fills, the material would have to come from the east, the most of it from the vicinity of the Isle Royal mill, about three-quarters of a mile west of Pilgrim River. The track would cross the place where you would get the material. The South Shore has a trestle outside the land portion of their yard, which has been used for various purposes, and it would be necessary, in building a track in front of the yard, to provide an opening to enable them to reach this trestle. If there was no South Shore there, you would be cutting off somebody's right of free access to the channel of Portage Lake, whoever owned the land. There is a draw span where the M. R. and

C. R. cross Portage Lake about 400 feet east of the South Shore yard west line.

The amount I have included for a pile trestle is intended for a pile trestle outside the yard and outside the present pile trestle of the South Shore opposite the Houghton terminal. I should have included the trestle that is there as a construction item in my estimate of what is there and have that as an item of deduction. Mr. Riggs' estimate would be fairer than anything I could give you on that trestle, not knowing the details of construction. The present trestle is about 700 feet long, and, owing to the location of the line, in order to avoid the South Shore right of way, it gives about 2,100 feet. The new trestle I have planned cannot be used for wharf space, as it would be only an ordinary railroad trestle, built for the carrying of traffic by this property, and into a suitable yard on the west.

999 About 12 years ago, the M. & N. road, which is now a part of the St. Paul system, projected a road into Houghton along that line, but they did not come in. The Copper Range was built about that time. I think at present the land surrounding the South Shore line, between Pilgrim River and the west yard limits, is held in large tracts, or subdivided and lots offered for sale. I do not know absolutely what the ownership along this strip is. I made no investigation. I would consider a strategic location is one that occupied a place where it was practically impossible to put another road by without great excessive cost, and I believe that strategic location to be worth the excess cost to construct a line over some other route.

(Government chart of Portage Lake marked Defts.' Ex. 42.)

I have never surveyed a railroad route in any direction into Houghton. I have in my office the record of all the surveys made by the Copper Range. I am familiar with the topography of that part of the country. It was not absolutely necessary for the C. R. to take the route it did; there was, before construction of the C. R., a line run easterly passing near the cemetery, shown on Defts.' Ex. 42—a 1% line, as I recall it.

BATCHELDER.

Redirect examination.

By Mr. Eldredge:

In building a substitute line, I don't see how you could use a portion of the ground occupied by tracks of an already existing line. If we did use a portion of that line, instead of building the pile trestle in front of the yard, it would cut the South Shore off from the water entirely, and from any use of the water front, except you provided an opening in the trestle.

1000 I read the testimony of Mr. Riggs in this case referring to a substitute line, and made a hurried examination of the same ground that was covered by his testimony. Assuming that a right of way in front of the property of the South Shore could not be obtained,

there is no more feasible route than that of Mr. Riggs. The Milwaukee & Northern road, in their proposed line into Houghton, took a route in the water substantially the same as mine, and to a point beyond the South Shore terminal, at which point they proposed to cross Portage Lake on another bridge. That survey was long after the South Shore had occupied this property. The surveys were made in 1892.

BATCHELDER.

Recross-examination.

By Mr. Wykes:

I have never been called to testify in a case of this kind before. I never heard of anyone who applied this method of valuation of a railroad right of way before. The first details of it came to me either through Mr. Riggs' testimony or through conversations with Mr. Eldredge. I have made estimates of this nature for construction purposes.

The substitute yard I have provided gets you up a short distance closer to the business part of the village of Houghton—about 6 blocks from the bridge crossing the river. The freight house and other facilities would have to be located at the east end of the yard, to have sufficient room for them outside the M. R. tracks. Your work tracks would be closer to the business portion, but your freight house and team tracks would not be materially nearer. There is no possibility of locating another track through the South Shore terminal on the water front, without interfering with existing tracks. There is a possibility of locating a line across the face of this cut, on the south side of it—the ground covered by Mr. Riggs, in his testimony. It
1001 could be located on the water front, and only cross freight tracks, but, if you were going to capitalize the cost of operation spoken of here a few minutes ago, you would have an enormous sum to add, to cover that; run one railroad yard through another and attempt to do your switching, and it would cost you a nice sum to cover that. It would practically ruin the other yards.

BATCHELDER.

Redirect examination.

By Mr. Eldredge:

I never had any consultation with Mr. Riggs about this matter; this investigation was done entirely by me. In locating work, the engineer always takes into account the relative cost of construction, as well as the cost of land, and the total cost of both is the controlling factor. An engineer must endeavor to strike the proper balance between the two that would give the cheapest road.

1002 On January 8, 1914.

HENRY R. HARRIS, a witness called by plaintiff.

Direct examination.

By Mr. Eldredge:

I am General Manager of the L. S. & I. and the M. M. & S. E. Ry. Companies. I know the trackage rights of the South Shore in Lake St. in Marquette, described in items 4 and 25, Marquette County, of Compit.'s Exhibits 1*b*, Riggs, and 1*c*, Riggs. The tracks are well situated for taking care of the business, and in a good location. The cash value of the right of the South Shore to occupy that stretch of land is about $30,000, in my judgment, based on the value of the land and what it would be, for the advantage a railroad would have, to have tracks located on the property. It would be worth that sum to my railroad. (Subject to objection as incompetent and irrelevant.) A railroad company could afford to pay that amount for the right to use the tracks there. The M. M. & S. E. could afford to pay, prescently, that price for those rights, which would be a value to it on account of furnishing facilities for obtaining business that we do not now possess. We have only a right of way in Lake St. for a single track road—a 13 or 14 foot right of way. We have no place to meet trains, in the whole width of Lake St. approximately three miles in length.

The track owned by the South Shore is between our own main track and the lake, so we have no opportunity to reach the shore line within the harbor limits, and it would give us additional earning power if we could have that space now occupied by the South Shore track, and it would aid us in handling our trains if we could have another track parallel to ours wherever required.

Our passenger and freight houses are north and east of Washington St. Our passenger location is bounded, south by Washington St. and east by Lake St., with a street between our passenger station and the track. Next to our main track is the South Shore, Lake St.,
1003 track. Beyond that is a space 150 feet wide, along Lake Superior. Part of that is on the same grade as the street, and part on the level of Lake Superior.

With the South Shore track out of there, we could have a yard of four or five parallel tracks, which it is now impossible for us to acquire. This track of the South Shore in Lake St., from Washington St. easterly, would form part of that yard; I consider that in fixing its value. In my judgment, that trackage right would be more useful to the South Shore than to our railroad. It is the inside track between the street and the harber limit. The fact that the 4,000 plus feet constitutes the main line of the South Shore from the east has a great bearing on it.

HARRIS.

Cross-examination.

By Mr. Wykes:

I included, in the value I fixed, that part of the trackage right occupied by the South Shore main line. If we had that, it would break the South Shore line in two. The L. S. & I. is west of the South Shore tracks, south of the Standard Oil dock. If we owned to the water there, we could make yards down there, by filling the bay. The South Shore track from Washington St. northeast is used as an interchange track with our road, and sometimes for storing cars. There are no industries located upon it.

Assuming this trackage right is merely an easement, and that the city can order the tracks off at any minute, I would give it the same value as I have, on the assumption that they won't order it off. In fixing this value, I took into consideration, to a certain extent, the value of the land that belongs to the city occupied by the track. If a person had the use of that land, it would, to all intents and
1004 purposes, be his property. I don't think there would be any difference between the use of that land and the use by a street railway of land in the streets of Marquette. I never valued a street railway, or thought of the valuation of these trackage rights in that connection.

The L. S. & I was built in 1896. From the beginning, accounts of cost have been kept, so it would be possible to ascertain the original cost of that railroad today from the books of the company. There is about 26 miles of main line and approximately 15 miles of branches. The road runs through practically the same kind of territory as the South Shore. The M. M. & S. E. was started in 1901 and put in operation in 1902. The original records of the company show original costs. The road has about 130 miles of main line. We are within three or four miles of the South Shore for seven or eight miles, then spread apart as high as 15 to 20 miles, and then come together again at Munising Jct.

The principal business of the L. S. & I. is ore. The rates are the same as those charged by the South Shore. Our passenger earnings in 1912 were about $5,000, total, about 1% of our ore revenue. About 10% of the business is freight other than ore, practically all of it coal from Marquette. I have investigated to see whether this ore business on the L. S. & I. is carried at a profit, and decided it was not at present rates.

The L. S. & I. is economically operated. I testified in the ore rate case in Chicago, and stated that, including all the railroads in the mining district, the entire trackage of sidetracks and branches to serve the mines and stock piles were moved on an average once in 15 years, and that some tracks were moved more frequently. I used that as an element indicating ore costs. That is a material ore cost. The track around the stock pile moves more frequently, which re-

quires special locomotive service to serve the stock pile and
1005 move cars about it. I refer to that as a cost of ore business that did not apply to freight generally. The L. S. & I. is now attempting to secure an increase in ore rates, due to my belief that, under present rates, there is no adequate profit. There was no net profit after payment of taxes in 1911—a low tonnage year. I could not recall 1910. I should say there was a small profit. There was a small profit in 1913.

I have no authority, without action of the Board of Directors of my companies, to purchase this Lake St. right of way, or agree on a price for it. I think the facilities of the L. S. & I. at North Marquette for ore dock purposes will answer its needs for a good many years.

HARRIS.

Redirect examination.

By Mr. Eldredge:

The South Shore is so constructed through Lake St. that there can be no use for street purposes of that part occupied by the South Shore, which differs from a street railroad. The use by the L. S. & I. and South Shore of the parts of Lake St. that they occupy is exclusive. The Munising road was started in 1895, and completed, as far as Little Lake, in 1897. It is about 70 miles long.

In my testimony in the ore rate case, I stated that the L. S. & I. was an unique railroad, built for the ore business, and not — be compared with any other road in the U. P., that it did a very small freight business, that its passenger business was inconsiderable, and that there was no possibility that its general freight and passenger business would be greatly increased. I said there ought to be charged to operating expenses a sum which, within the life of the mines which that company serves, would absorb the entire cost of the road.
1006 I believe we are in an entirely different position than the South Shore or the Northwestern roads. Our road showed a profit in 1897, 1902 and, I think, in 1907. In 1911, we did not show a profit, and in 1912, we did not show as much of a profit as in previous years. The only year that I remember right now where the amounts received for transportation were less than the expenses of operation, as per the I. C. C. classification, was 1911, which was a year of light tonnage. I think 1908 there was a loss, as we had light tonnage. In all the years except 1908 and 1911, we showed a profit above operating expenses, taxes and such depreciation as was charged. Our rates up to 1911 were 32¢ a ton, and after that 25¢. They are now 30¢. We have put in a 5¢ increase, and the question of its legality is at issue before the I. C. C.

I was called as a witness in the ore rate case to defend this increase in the rate, and I assume that, in addition to the ordinary depreciation charged by our company in its book of account, there should be taken in sums which, within periods of time that I gave, should amortize the entire cost of the property. I figured on branch tracks to mines being replaced in 15 years, and main line in 33 1/3

years, so that there should be added to the expense of the ordinary operation such a sum per annum as, amortized, would at the end of 33 1/3 years take up the entire cost of the road. All the figures I used in the ore rate case include the replacement of the property by the time the property was worn out. Included in the figures were actual costs, but the results arrived at were an argument.

HARRIS.

Recross-examination.

By Mr. Wykes:

The testimony I gave in the ore rate case was sworn testimony. It was my purpose to give the true state of facts, so far as I furnished figures not stated to be estimates. With the L. S. & I., in this
1007 peculiar situation, it must make the cost out of its ore business, and carry it at as much profit as it can reasonably get, and at as reasonable cost as is possible. Prior to Jan. 1, 1913, we charged no depreciation on our ore docks. The only depreciation in our reports to the State is depreciation on rails (for the past two years), equipment, and ore dock, since 1913. I should say the L. S. & I. road was as well adapted to carry ore business as any other railroad in the community.

HARRIS.

Redirect examination.

By Mr. Eldredge:

I do not think the State has ever issued positive instruction about the charge for depreciation. The I. C. C., in 1907, issued instructions that depreciation must be charged on equipment, but it left the rate to the railroad company.

1008 On January 27, 1914.

STEPHEN WOOD, a witness called by Plaintiff.

Direct examination.

By Mr. Eldredge:

I live in Marquette. I am, and have been, freight conductor 18 years; on South Shore, 10 years freight, and passenger some; I ran extra passenger about a year—within the last year. I am now local freight conductor between Marquette and Houghton, on Nos. 33 west and 34 east, one way each day, six days a week; the schedule time of 33 is 11 hours and 30 minutes, and of 34 is 11 hours and 25 minutes. I go on duty 30 minutes before leaving time; in that 30 minutes, I and my crew do braking, couple on the engine, couple up and adjust the air, while I, myself, take the numbers and seals

of the cars, and check them with the way bills. Trains 33 and 34 are local freights.

The duties of a local freight are to do all the station switching, load and unload package freight, deliver loaded and unloaded cars to connecting lines and industries, and pick up cars from transfer points and industries. In my judgment, about 50% of the time of my run, on an average, excluding coaling, taking water, and delays by meeting other trains, is devoted to station and transfer switching and loading and unloading freight.

WOOD.

Cross-examination.

By Mr. Wykes:

The passenger conductor also takes his train 30 minutes before taking it out. My compensation is on hours; we get paid by the miles if they exceed the hours.

Nestoria is the only coaling station between here and Houghton; that would take practically only 15 minutes to coal in. We make five stops for water from here (Marquette) to Houghton; sometimes we run by some of those tanks; as a general thing, in bad
1009 weather, we take water pretty nearly everywhere. At Negaunee or Ishpeming, Michigamme, Herman, L'Anse and Keweenaw Bay, we take coal and water right on the main line. Passenger trains generally take water twice between here and Houghton—at Michigamme and Keweenaw Bay; they don't take any coal, Marquette to Houghton.

I have never had a regular time freight run; I have made runs from Marquette to Thomaston—a few trips—on time freight; that freight would take coal at Nestoria and Ewen, and water at Negaunee, Champion or Michigamme, Vermilac, Trout Creek, Ewen and Lake Gogebic. I have had a passenger run from Marquette, through Thomaston to Duluth. That train would take no coal between those points, but would take water at Humboldt and Vermilac; it might take water four times, Marquette to Thomaston, depending on the engineer and weather conditions. I have been on all the passenger runs on the road.

No. 7 leaves Marquette 11.45 P. M. The switching for that train consists of a sleeper being taken off and another put on at Nestoria, consuming about 15 minutes; that is all the switching that is done.

No. 8, from Duluth toward Marquette, takes off and puts on a sleeping car at Nestoria, puts on a dining car at Marquette, and takes off a sleeper at Soo Jct. That is all the switching done.
